Mr. HAMMITT. I do not think there is any calcium carbide being imported at the present time. The Union Carbide Co., I think, some times delivers carbide in the United States from its plant on the Canadian side of Niagara Falls.

Mr. CROWTHER. Just what component part of explosives is ammonium nitrate? Is that the product that by distillation produces nitrous oxide?

Mr. HAMMITT. You have gas before you get ammonium nitrate. The ammonium nitrate produced at Muscle Shoals was to be used with T. N. T., and to produce a bursting charge and an explosive known as amatol was to be used. That is rather an interesting situation regarding the Muscle Shoals nitrate plant, because if you keep that plant in stand-by condition, and it does require a period of months to get that plant in operation in case we go into a war, the product of that plant is not of any use until you have other plants in operation. You have to get a T. N. T. plant in operation before you can use ammonium nitrate. And those plants have been scrapped. You have ultimately got to have your propellant charges which were to be made at Nitro and Old Hickory plants, which have been scrapped. Those plants would have to be set up again, or else any immediate production of ammonium nitrate would merely clog the railroads with a considerable amount of shipments which would not have anywhere to go and there would be no way to use them.

Mr. CROWTHER. In other words to make this a valuable adjunct to the War Department there should be maintained in stand-by condition several other plants for the production of several other ingredients to make this one available; they must all work together?

Mr. HAMMITT. They must all work together, and there would certainly be no opportunity to use the product of the Muscle Shoals plant successfully until some of these other things were also ready.

(Thereupon the committee adjourned at 5 o'clock p. m., to meet to-morrow, Tuesday, February 21, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,

HOUSE OF REPRESENTATIVES,

Tuesday, February 21, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

STATEMENT OF MR. J. O. HAMMITT—Resumed.

The CHAIRMAN. Mr. Hammitt, the committee will be very glad to conclude with you this morning, and Mr. Wurzbach would like to ask you some questions.

Mr. WURZBACH. Mr. Hammitt, what is cyanamid?

Mr. HAMMITT. Cyanamid is a form of fixed nitrogen which is produced by soaking up all the nitrogen gas you can soak up into calcium carbide and then preparing it in a form in which it can be practicably used in a fertilizer mixing plant. It has approximately 25 per cent of ammonia.

Mr. WURZBACH. Did you explain why the Air Nitrates Corporation could not make an offer now for the nitrate plant if the nitrate plant was separated from the water-power proposition?

Mr. HAMMITT. Yes, sir. Assuming that the situation were all laid out clear, so that it was perfectly practicable to make a disposition of the nitrate plant separately from the water power, we would not be able to make a proposition for the nitrate plant, because we can not work out any manufacturing program for that nitrate plant that could be commercially successful, unless it received aid from the Government, and a proposition involving aid from the Government we believe is against public policy, as involving an indirect entrance of the Government into private industry.

Mr. WURZBACH. If that is true, then the option you have under section 19 is such an option that you could not avail yourself of it if you were given the right to avail yourself of it, by your own admission?

Mr. HAMMITT. No; because while we will not make the Government a proposition for the operation of the plant with financial aid from the Government, if the Government decides that it is going to provide for the operation aided out of the Government Treasury; if, for example, the Government should decide that this proposition of Mr. Ford's would be acceptable to the Government, then

we would have something we could do business on, of course. It would not be in accordance with our judgment of the way contracts ought to be made with the United States Government but it would protect the interests of our stockholders.

Mr. WURZBACH. But aside from any governmental aid or subsidy, suppose that the Ford offer had not been made or suppose that it were withdrawn from all consideration, and the Government were to separate the nitrate plant from the water power, and in accordance with article 19 would give you notice and would ask you to make a bid, you would not be able to make any kind of bid at all?

Mr. HAMMITT. Under article 19 what the Government would give us would be a notice that would contain a statement of the best terms upon which the Government was prepared to dispose of that plant. Now, we believe that the Government is not in a position to offer terms that will protect the Government that we would accept; but if the Government should offer us terms, then it would no longer be any part of our function to consider whether those terms protected the Government; that would have been decided by responsible governmental authority, and we would give very careful consideration to the question of whether we could take over that nitrate plant and operate it on those terms, and it is our belief that we would be in at least as good a position, and very likely in a better position, to work out an operation of that plant, as soon as a situation arises where such an operation is commercially feasible, than any other party.

Mr. WURZBACH. But there is nothing in article 19 that either expressly states or implies any Government aid to the corporation or individual contemplating the purchase of the nitrates plant, is there?

Mr. HAMMITT. Nothing whatever, as I read that article.

Mr. WURZBACH. Nothing at all. Now, putting aside or taking out of consideration the Ford proposal altogether, and assuming that the Government would suggest to the Air Nitrates Corporation that they intend to sell this property for cash.

Mr. HAMMITT. Yes, sir.

Mr. WURZBACH. Would the Air Nitrates Corporation be in a position to avail themselves of that article 19 and make an offer; and, if so, what offer would they be able to make?

Mr. HAMMITT. It is my opinion that the Air Nitrates Corporation would not be in a position to offer to purchase the plant under those conditions.

Mr. WURZBACH. What is the financial ability of the Air Nitrates Corporation?

Mr. HAMMITT. The Air Nitrates Corporation is able to pay its bills, sir, and it is able to conduct its present operations and it has good credit. The financial capacity of any relatively small industrial unit, such as Air Nitrates Corporation, to take over a new proposition is always dependent upon the soundness of that new proposition, among other things, and if the new proposition were an attractive proposition financially and one that promised to be able to earn interest on bonds that might be issued for the purpose of financing it, the Air Nitrates Corporation could present that matter to those whose business is finance and doubtless could get a hearing before them, and if the proposition were sound, could get that cooperation which every corporation requires to get when it expands in financing. It would be most uneconomical for a corporation with the business that the American Cyanamid Co. has to have an enormous bank account, because that would merely mean so much money that was not put to work. The Air Nitrates Corporation, or rather I mean the American Cyanamid Co., has not money that has not got to work. The Air Nitrates Corporation is merely a subsidiary of the American Cyanamid Co.

Mr. WURZBACH. The option inures, however, only to the Air Nitrates Corporation and not to the American Cyanamid Co., does it not?

Mr. HAMMITT. The option is a right of the Air Nitrates Corporation, and the Air Nitrates Corporation is owned entirely by the American Cyanamid Co., and I would be deceiving the committee if I did not make it clear to the committee that the American Cyanamid Co. is the real party in interest.

Mr. FIELDS. Mr. Hammitt, where is the home office of the American Cyanamid Co.?

Mr. HAMMITT. 511 Fifth Avenue, New York.

Mr. FIELDS. What is the extent of its operations in the United States?

Mr. HAMMITT. It has a phosphate mine in Florida; one of the largest of the Florida pebble phosphate mines, involving an investment of approximately \$5,000,000, without the actual figures before me. It has a plant on the New

Jersey side of New York Harbor involving an investment of something over \$3,000,000, a part of which has been written off as depreciation, bringing the amount of that investment down to something over \$2,000,000. It has a plant in California, which is a relatively small plant, but engaged in the very important business of manufacturing hydrocyanic gas for the fumigation of citrus trees in California.

The CHAIRMAN. In what part of California?

Mr. HAMMITT. It is near Los Angeles.

Those are the plants of the American Cyanamid Co. in the United States. To complete the story, its only other plant is located on the Canadian side of the Niagara River at Niagara Falls.

Mr. FIELDS. And that is its big operation?

Mr. HAMMITT. The size of the investment in that plant, so far as not amortized, is a little under \$3,000,000. I would not say it was its big operation in normal times. At the present time the main business of the American Cyanamid Co. has nothing whatever to do with the fertilizer industry and consists of products made at Niagara Falls, Canada, and at Azusa, Calif., which is the location near Los Angeles.

Mr. FIELDS. What connection has the American Cyanamid Co. with the Alabama Power Co.?

Mr. HAMMITT. It has absolutely no intercorporate connection of any character whatever.

Mr. FIELDS. None of the stockholders of the American Cyanamid Co. own stock in the Alabama Power Co.?

Mr. HAMMITT. I could not say that as to all of our stockholders, but I will say that no one owning a very large, substantial interest in the American Cyanamid Co. owns a large, substantial interest in the Alabama Power Co. I think it is entirely possible that some of our stockholders may have stock in the Alabama Power Co. or own some of their securities.

Mr. FIELDS. It is highly probable, is it not, that some of the stockholders of the American Cyanamid Co. own stock in the Alabama Power Co.?

Mr. HAMMITT. I think it is probable to this extent: There is one banking house in London that at one time handled some of our securities, and, according to my information, has handled securities of the Alabama Power Co., and that is Sperling & Co. Sperling & Co.'s interest in the American Cyanamid Co. is entirely through stock ownership, for we have no bonds, and the amount of stock in American Cyanamid Co. that they own, I should say, does not amount to more than 6 per cent; and when I state that I am including not only the stock that Sperling & Co. probably actually own but I am speaking also of the stock that Sperling & Co. were engaged in marketing.

Mr. FIELDS. What connection has the American Cyanamid Co. with the Georgia Railroad & Power Co.?

Mr. HAMMITT. None whatever.

Mr. FIELDS. None of its stockholders own stock in the Georgia Railroad & Power Co.?

Mr. HAMMITT. Not to my knowledge.

Mr. FIELDS. What connection has it with the Columbus Power Co.; that is, what connection has the American Cyanamid Co. with the Columbus Power Co.?

Mr. HAMMITT. None whatever.

Mr. FIELDS. What connection has the American Cyanamid Co. with the Central Georgia Power Co.?

Mr. HAMMITT. None whatever.

Mr. FIELDS. Has it any connection with the Tennessee Power Co.?

Mr. HAMMITT. It has none.

Mr. FIELDS. The reason I am asking these questions is because I notice that Mr. Duke and the representatives of these four companies are apparently agreed as to their opinion of the production of power at Muscle Shoals.

Mr. HAMMITT. Yes.

Mr. FIELDS. And I thought there might be some connection between the companies because their minds so thoroughly agreed upon that subject.

Mr. HAMMITT. There is no connection whatever.

Mr. FIELDS. You say that the Air Nitrates Corporation is a subsidiary of the American Cyanamid Co.?

Mr. HAMMITT. Yes, sir.

Mr. FIELDS. And you claim that the Government of the United States is morally, if not legally, bound to sell nitrate plant No. 2 to the Air Nitrates Corporation by reason of article 19 in this contract?

Mr. HAMMITT. Providing, in the first place, the Government determines to sell it; and, in the second place, Air Nitrates Corporation is prepared to pay for it as good a price as anybody else is prepared to pay.

Mr. FIELDS. I notice that article 19 does not apply alone, as I construe it, to plant No. 2 at Muscle Shoals, but also to plants 3 and 4 in Ohio.

Mr. HAMMITT. That is true.

Mr. FIELDS. Is the Air Nitrates Corporation in a position and ready to submit a proposition to the Government on plants 3 and 4?

Mr. HAMMITT. Those plants were not completed, Congressman; and quite in accordance with our views, and I think in accordance with the advice that in response to inquiry we gave to the Government, those plants have been dismantled.

Mr. FIELDS. They have already been dismantled?

Mr. HAMMITT. Yes, sir.

Mr. FIELDS. I knew they were not completed, but I did not know they had been dismantled.

Mr. HAMMITT. Yes, sir; they have been.

Mr. FIELDS. Now, with regard to public policy, you contend that as a matter of public policy the Government and the Congress should recognize this contract in article 19?

Mr. HAMMITT. I do. I think it is proper public policy for the United States Government to live up to the agreement that it has made, and as, of course, I have made clear to the committee, I consider this an agreement which the United States Government has entered into, and that there is no objection to it except one that is based upon legal technicality.

Mr. FIELDS. Now, let us see about that. Let us forget, for the moment, your connection with the Air Nitrates Corporation and my connection with the Government, except our connection as citizens.

Mr. HAMMITT. Yes, sir.

Mr. FIELDS. As a matter of general public policy, would you feel that the agents of the Government should be bound in their transactions with corporations or individuals who are negotiating with the Government by the Constitution of the United States and the laws upon the statute books, or by their own desires or what they might desire to accomplish upon the spur of the moment? As a general policy, which would you recommend?

Mr. HAMMITT. As a general policy, I am certainly in favor of sustaining the Constitution and the laws.

Mr. FIELDS. Then as a general policy, if you are in favor of sustaining the Constitution and the laws, why would you make an exception in this particular case?

Mr. HAMMITT. In the first place you do not want to put me in the position of appearing to state that this is an exception, because, of course, you recognize the fact that we do not think it is an exception. We think that this provision is entirely valid, but assuming that there was a sound, legal objection to the validity of this particular provision, I would have in mind the fact that at the time this contract was made there were a great many unusual things which the Government was required to do. Everyone, certainly, who was familiar with the experience of the Government in its endeavor to mobilize American industry recognizes that fact.

Now, not only were there a great many unusual things to do, but there were a great many things that had to be done under very great pressure; and in addition to that there was a very considerable amount of very unusual emotion in the country that is always an incident of a thing like this World War. Feeling ran very high. If a matter upon which there had been very competent legal advice, taking it in the ordinary terms, if regarding a matter of that sort, as to which there had been very competent legal advice, the American Cyanamid Co. had said, "Well, now, there is a little legal doubt as to whether that particular provision will hold, despite this advice we have received, and we will not risk entering into that kind of a contract," you know that the officers of the American Cyanamid Co. would have been considered pro-German. Their lives would not have been very pleasant in these United States, and I say that it is entirely proper that it should be so. So that I think I would consider, as to this particular contract which, as I have said, I believe in this particular provision is valid, and will hold in the courts, but assuming that there were a shade of doubt about it, I think, under those circumstances, I certainly would resolve the shade of doubt in favor of carrying out this contract; and I will say that if you do not do that it is more than likely that a most careful and meticulous legal examination of a great many contracts that were made at that time, during the war, might

lead you to raise similar question regarding them. Now, all of this, I am stating. Congressman, in an effort to give a complete answer to your question. I want it clear on the records that all of it is predicated on a thing being a fact which I do not admit as being a fact, and do not believe as being a fact, namely, that there is any substantial doubt as to the legality of that provision of the contract.

Mr. FIELDS. In reply to your suggestion that a failure on the part of the Government to recognize this contract may lead to an investigation of other contracts, I want to say in that connection that if other illegal contracts were made under the conditions to which you refer, this one being made on the 18th day of July just as our Armies were starting their drive in Europe, when the public mind was not centered upon contracts or their legality, but upon winning the war, if any corporation or firm or individual at that time and under that stress, with the aid of the most able counsel that the United States has, succeeded in securing illegal contracts, not authorized by the Constitution of the United States and the laws of the United States, they ought every one to be contested, and I for one hope that that may be done.

Now, let us take up the question again of the moral obligation. A few days ago I asked Col. Burns, who was counsel for the American Cyanamid Co. He was not able to tell me. I was sure they had able counsel, and I learned from you yesterday that their counsel was Mr. Justice Hughes, one of the most honorable citizens of the United States, and possibly the most able lawyer in the United States.

Mr. HAMMITT. Now, Congressman, do not—

Mr. FIELDS (interposing). Wait until I finish my statement. I am not saying anything that is disparaging of Mr. Hughes, and I am not going to.

Mr. HAMMITT. But you are stating—

Mr. FIELDS (interposing). But, of course, when the cyanamid company told him what they wanted, that they wanted to construct this plant on a cost-plus basis and wanted a royalty fee and an operation fee and an option upon the plant in the event the Government should decide to sell it, he, as an attorney and an honorable man, proceeded to draw their contract for them as strong as it could be drawn, and nobody criticizes him for that.

Mr. HAMMITT. Now, Congressman, in the first place—

Mr. FIELDS (interposing). I have not finished my statement.

Mr. HAMMITT. All right, sir.

Mr. FIELDS. We want to come again to the moral obligation of the Congress and the Government upon a contract of that kind.

Mr. HAMMITT. But you are not going to leave that other statement in the record without allowing me to correct the facts regarding our retainer to Justice Hughes. It was not a general retainer. He was not our attorney.

Mr. FIELDS. He was your counsel upon this proposition.

Mr. HAMMITT. As to the matter of the drafting of this contract our attorneys were Messrs Sullivan & Cromwell. Justice Hughes was called in solely to advise regarding this one particular point, as to the form of protection that we could receive, and I do not want to have the record appear that Justice Hughes's part in this matter was any greater than it was. Now, I think that does not affect your subsequent statement at all, and you must be glad to have the record correct.

Mr. FIELDS. Yes; I am glad to have you make that statement, because it brings out another thought. Messrs. Sullivan & Cromwell were able attorneys. I assume, or they would not have been in the employ of the American Cyanamid Co.

Mr. HAMMITT. Their reputation does not depend upon this particular retainer. They certainly are able attorneys.

Mr. FIELDS. But for some particular reason, unknown to the committee, Mr. Justice Hughes was called in for consultation upon this contract or upon this particular provision of the contract.

Mr. HAMMITT. And if the committee does not know the reason, I would like to state it to the committee, which is that we desired to have the very best legal advice on that point we could get in the United States, and we suggested, to that end, the retention of Justice Hughes to advise on that point to the officers of the Government, and found that it was satisfactory to them, and were so advised by them, and thereupon Justice Hughes was called in.

Mr. FIELDS. Well, Mr. Hammitt, you evidently had a lingering suspicion that you were about to involve the United States in an illegal contract or at least a contract about which there was a great deal of question as to its legality.

Mr. HAMMITT. No; we simply had a very difficult problem as to how we should provide the kind of protection that the American Cyanamid Co. desired and the Government officers agreed it should have, and to do it in a legal way. We had never had any expectation of writing an illegal contract, and if there had been any doubt whatever at that time as to the legality of this contract, after the matter had been considered by the attorneys, we would have sought our protection in some different way and surely would have found a legal way.

Mr. FIELDS. Well, how could you have found a legal way other than to have come to Congress.

Mr. HAMMITT. Well, wherever we would have had to go or whatever we would have had to do, I am perfectly confident that we would have found a legal way, and just what form that would take and just how that thing would be worked out is a question, as you have observed, that very able attorneys were engaged upon, and not being an attorney of any sort myself, I certainly do not want at this time, after the facts, to suggest how it would have been done.

Mr. FIELDS. You would not have refused to have constructed that plant for the Government, for which they paid you \$1,500,000, if the Government had refused to give you this option, would you?

Mr. HAMMITT. As to the construction of that plant for which we have received no money that we have not had to pay back, the American Cyanamid Co., I imagine, if faced with a situation where that thing had to be done, in a way that would give the American Cyanamid Co. no protection whatever in the future—in other words, if it had to be done on the basis of the American Cyanamid Co. paying the cost of the war at the expense of its stockholders instead of its being paid by the United States Government, we would have been faced with a problem that I confess I do not know just how it would have been worked out, but I am very strongly impressed with the fact that it is conceivable that under those circumstances, without any protection whatever, the American Cyanamid Co. would have felt compelled to contribute what it could contribute and trust to the fairness of the Government in the future, through its legislative as well as its executive branches, in protecting the American Cyanamid Co. against destruction as a result of what it had contributed. Now, that situation we did not face, because even if we had been advised that this thing was invalid, we would have exhausted, no doubt, the possibilities of finding some form of protection that would have been clearly valid. Now, just what form that would be, as I said before, I can not specify or speculate regarding at all, but I know that we would have looked for some other form of protection if there had been any doubt about the validity of this.

Mr. FIELDS. Article IV, section 3, clause 2, of the Constitution reads in part: "The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory or property belonging to the United States."

Upon your contention that you think it was a legal contract, do you mean for the record to show that you contend that you believe that Mr. Justice Hughes, for many years an Associate Justice of the Supreme Court of the United States, was not familiar with that clause of the Constitution?

Mr. HAMMITT. No; I am quite sure he was familiar with it.

Mr. FIELDS. Then, every Member of Congress at the beginning of each session takes an oath to support and defend the Constitution; and, in view of the fact that your chief counsel knew that the Constitution contained that language and that a Member of Congress takes an oath to support and defend the Constitution, you claim that this contract should carry more moral force with the Congress than the Constitution and the oath that they have taken to support it.

Mr. HAMMITT. I certainly do not claim that any contract should carry more moral or binding force in any way than the Constitution of the United States.

Mr. FIELDS. Very well. I am glad to hear you say that.

Now, in regard to the exercise of your option. It seems that—following you as carefully as I can—there is hardly any course that the Government can take in line with the principles implied in other Government contracts or with the sound, honorable ethical methods of business that will enable you to exercise your option; just what would the Government have to do?

Mr. HAMMITT. I think it is an actual fact, Congressman, and this is undoubtedly what you are coming to in your consideration of the matter; that that nitrates plant down there can not possibly be operated by the American Cyanamid Co. or by anybody else at the present time upon a commercial basis without sustaining a loss. Therefore, if the United States Government is to

provide for its operation on a commercial basis, the United States Government must bear that loss or somebody else must, and the American Cyanamid Co. is unable to do so.

Mr. FIELDS. Well, did the American Cyanamid Co. have that thought in mind when it drew this contract?

Mr. HAMMITT. I would not be able to say whether the American Cyanamid Co. at that time was able to project as to what the situation regarding a commercial operation of that plant would be after the war. And, right at that point, let me tell you one reason why it would have been very difficult to project it. You take the year 1914, before the World War, and you take the whole history back for a considerable period of years before we entered into the World War, the amount of sulphate of ammonia produced in the United States in those years was very insufficient to meet the American requirements, and we were importing somewhere from 60,000 to 100,000 tons of sulphate of ammonia annually, mostly from Great Britain. Now, along came the war, and the capacity of the by-product coke ovens built up to meet war needs and in some cases—

Mr. FIELDS (interposing). Which was an abnormal condition, of course.

Mr. HAMMITT (continuing). And in some cases, aided with the advance of Government funds for that purpose, built up under pressure to meet war needs, so expanded the American production that it went up from approximately 185,000 tons to 500,000 tons; and, so, in the year 1920 and even in the year 1921, with the steel industry very largely down, we have had a surplus of sulphate of ammonia in the United States for export and have exported as much as approximately 125,000 tons in one year, instead of importing 100,000 tons.

Mr. FIELDS. Oh, yes; but you are not taking into consideration the depressed condition in agriculture whereby agriculture did not consume the amount of fertilizer or the amount of ammonium nitrate that it did under normal conditions.

Mr. HAMMITT. But the total amount of consumption of ammonia in the United States in the most banner and bumper year for agriculture and for everything else never approached the present production capacity of the by-product coke ovens and the gas works, and we have become a large exporting Nation. And there is another thing I did not take into account in that statement. The same expansion in that industry for producing ammonia as a by-product which occurred in the United States during the war also occurred during the war in Germany. It occurred during the war in England. It occurred during the war in France. So that when we go into the export market with our surplus products we are meeting an over-expanded industry in those other countries; and it is a fact that you are paying now, if you buy sulphate of ammonia, less than one-half the price for it that you were paying for it a few years ago.

Now, I am not sure that the American Cyanamid Co. engaged at that time in negotiation with the United States Government was able to forecast that situation, and therefore I am not at all sure that the American Cyanamid Co. would have been able to say at that time that after the war it was not practicable to operate this plant on a commercial basis; but we can say it now, with our knowledge of the facts.

Mr. FIELDS. In that connection, if fertilizer products could be produced more cheaply than they have been produced, that would naturally increase the demand for them and the consumption of them in the United States, would it not?

Mr. HAMMITT. Yes; it would. I think that is undoubtedly true. I think that the quantity of fertilizer that is sold is very materially affected by the price, and I think that that matter must be of very great concern to the fertilizer industry, which at the present time has a capacity in this country of 10,000,000 tons and has a market of less than 5,000,000 tons.

Mr. FIELDS. And that should be a matter of great concern to the consumers and users of fertilizer.

Mr. HAMMITT. It certainly should, because the price of any product is of importance to the consumer.

Mr. FIELDS. And if, by any method, the cost of production can be lessened, the users of fertilizer certainly must be entitled to some consideration in an analysis of that problem.

Mr. HAMMITT. Yes, Congressman; and that consideration, I think, does not extend to this point: I do not think that the money of the taxpayers should be taken out of the United States Treasury to make up the losses of a manufacturing operation in order to dump more sulphate of ammonia on the market in order to depress the price of sulphate of ammonia still further. That I do not

think should be done even for the purpose of reducing the price of fertilizer. Now, that is irrespective of the question of what effect that would have upon the price of the fertilizers, which would be exceedingly small; but if you are going to attempt to examine me on a fertilizer question, let me take you further into my confidence and say I am not a fertilizer manufacturer. I do not know anything about fertilizer manufacturing except in a very general way. I am engaged in a chemical manufacturing business, one of whose products goes into the fertilizer industry, but my knowledge of the fertilizer industry is extremely general, and I think it would be to the interest of this committee, if it wants to examine into a fertilizer question, to call before it somebody—and the committee has not had anybody here yet—who has had some practical experience in the manufacture of fertilizer.

Mr. FIELDS. I had no thought of going into that.

Mr. HAMMITT. I do not want to qualify as a fertilizer manufacturer.

Mr. FIELDS. Your reference to the price of sulphate of ammonia led to the question I asked, but let us get back to plant No. 2. I would like to understand, if possible, just how you expect the Government to proceed to make a proposition to sell this plant to the Air Nitrates Corporation. I have never been able to get that straightened out in my mind from your statements, and I am very anxious to do that.

Mr. HAMMITT. Now, of course, the United States will have to adopt its own methods, and would not necessarily accept what I think, personally, would be the most satisfactory method, but whatever method it adopts, and I am perfectly willing to suggest what I think would be the most satisfactory method before I get through; but first let us lay down the general principles, that under this provision of the contract the first thing the United States must do must be, in some form or other, to reach a decision to dispose of the plant. Then having reached that decision it must communicate in writing, through whatever body it sets up as the proper authority to do that, to the Air Nitrates Corporation the fact of its determination to dispose of its plant, and the material terms upon which such disposition will be made, and then the Air Nitrates Corporation has something before it to consider, something that can be considered by its directors and its stockholders, and something that can be considered by the bankers; and it is to have a reasonable time for such consideration, and such reasonable time is not to exceed six months, and I do not think the reasonable time will reach six months, because a matter of that sort will receive very prompt and very thoroughgoing consideration, and we will start out with a considerable knowledge of what the capabilities and the limitations of the plant are.

Mr. FIELDS. Judging from what you have said here, and what you said on yesterday, I gather that you contend for the right to compete with any offer made by any other individual or corporation.

Mr. HAMMITT. Well, we contend for rather more than that.

Mr. FIELDS. All right; what is it?

Mr. HAMMITT. We contend for the right to purchase that plant on as favorable terms as the Government is willing to make with somebody else. That is, if it is between us and the other fellow, and we are each of us willing to offer precisely the same terms, there is not any competition under this provision of the contract; we get the plant.

Mr. FIELDS. That is the point I wanted to bring out. Suppose the Government should say to you, "We have determined to sell this plant to Mr. Ford for a certain price," we will say the approximate salvage value, \$7,000,000, and you come in and say, "We are going to exercise our option." Then somebody offers \$10,000,000 for it, and somebody else \$12,000,000. Do you expect the Government to hold it open for you and to give you a chance to compete with the other man after he has offered his bid? Do you contend that the Government should not permit others to bid, if they wanted to do so, and would not that be a one-sided proposition?

Mr. HAMMITT. Well, as to whether that offer, delivered to Air Nitrates Corporation, at the \$7,000,000 price could subsequently be withdrawn by the Government before it was accepted, being an entirely new point which I have never given any consideration to, I would not want to make any statement upon it. I think that matter would have to be considered by an attorney, and I think your judgment on that, for I judge you are an attorney, would be better than mine.

Mr. FIELDS. No; I am not an attorney.

Now, I believe that you recommended that this nitrate plant No. 2 be maintained by the Government in an idle, stand-by condition.

Mr. HAMMITT. I think that is the best disposition to make of that plant at the present time; yes, sir.

Mr. FIELDS. And that it be maintained indefinitely in an idle, stand-by condition for the use of the Government in case of emergency.

Mr. HAMMITT. Yes; and by "indefinitely" I mean until such time as it is practicable to operate that plant on a commercial basis without loss.

Mr. FIELDS. Then, getting right down to the milk in the coconut, you are not seeking a chance to exercise your option, but you desire to have the Government hold this plant in an idle, stand-by condition, holding it out of competition with the American Cyanamid Co., at an expense of approximately \$200,000 a year.

Mr. HAMMITT. There are several parts to that question, and I have been over this so frequently that I thought my position was thoroughly clear; but let us go over it again briefly. In the first place, we think the best thing the Government can do with the plant at the present time is to keep it in stand-by condition, and the testimony you have had from the Ordnance Department does not say that that costs \$200,000, but is now costing \$125,000 a year, and that the proposition is self-sustaining in view of the fact that a part of that plant is rented to the Alabama Power Co. for a minimum of \$120,000 a year, plus something per kilowatt hour, so that it does not need to cost the Government a cent.

Mr. FIELDS. But in order to get that result—

Mr. HAMMITT. If you want me to answer your question fully—

Mr. FIELDS. I do not want your statement to go in the record uncorrected. In order to get the result to which you refer, they would also have to maintain and operate or lease the properties that the Government owns in conjunction with the Alabama Power Co., the steam plant, etc., to reach that figure; and if the plant was maintained as an individual proposition, in an idle, stand-by condition, it would cost, according to the figures in the record, approximately \$200,000 a year. Last year it cost us \$201,647.

Mr. HAMMITT. My recollection is different as to the present cost of maintaining the plant, but assuming it is what you say, and assume in order to make—

Mr. FIELDS (Interposing). It was less because there were certain credits added from certain incomes.

Mr. HAMMITT. Now, let us assume, as you state, that in order to make the property self-sustaining it is necessary to lease the steam plant. I certainly would lease that steam plant if I could get an income out of it rather than keep that steam plant in idleness. As a matter of fact, if I could lease the nitrate plant on a basis on which the Government would get an income out of it, instead of keeping it in idleness, I would recommend leasing the nitrate plant. When I say that I think the best thing to do with the nitrate plant is to keep it in the stand-by condition, it is because I do not believe you can make any other disposition of it unless you go into the Government treasury to make up somebody's losses. Now, we do not recommend that you give a subsidy to anybody to operate that nitrate plant, but if you are going to give a subsidy to somebody on condition that he operate that plant, we want an opportunity to get that subsidy on as favorable terms as anybody gets it, and we believe that that is the obligation to us under this contract.

Mr. FIELDS. You say you would recommend first that it be leased. Suppose that in the proposal of Mr. Ford he proposed to lease nitrate plant No. 2 instead of purchasing it, would you then approve of the Ford proposition?

Mr. HAMMITT. I would not approve the Ford proposition, but it would not violate article 19 of our contract.

Mr. FIELDS. But you would not even then approve the Ford proposition?

Mr. HAMMITT. I certainly would not approve of any proposition that involves the United States Government aiding out of the Public Treasury a particular manufacturer to compete with private industry, and that is what the Ford proposition involves.

Mr. FIELDS. Now, you have emphasized the fact three or four times that the Government would be subsidizing Mr. Ford, because the power produced at Muscle Shoals would be the cheapest in all the country, and yet Mr. Duke, a very prominent figure in your company, I assume, and Mr. Lee, of the Southern Power Co., and the representatives of the four southern power companies that wrote the War Department protesting against the development of Muscle

Shoals, all stated—and I referred to that awhile ago—that the development of power at Muscle Shoals was impracticable, and Mr. Duke went so far as to say that if the Government will build its transmission line over to North Carolina "we will sell them power there cheaper"—I do not remember the figures right now, but considerably cheaper than it can be produced at Muscle Shoals. They characterized the whole proposition as foolish on the part of the Government, because the power could not be produced cheaply, and now you, associated with those gentlemen or some of them, say that it can be produced so cheaply that it would be a subsidy to Mr. Ford. I am frank to say I can not understand the reasoning of you gentlemen. If you are correct, why did these other gentlemen make that representation to the Government; and if they are correct, your premise is entirely wrong.

Mr. HAMMITT. Now, if you can not understand that, Congressman, let me assist you a little bit. I never read the letter of Mr. Duke until I saw it in the record of the hearings before this committee the other day. I have, perhaps, not a very detailed recollection of what the letter stated, but just taking your outline of it and assuming that to be correct, what Mr. Duke says is that if you take that power at Muscle Shoals and you transmit it over to the territory of the Southern Power Co., which is 400 miles away, that by the time you have put that amount of transmission cost into it, on top of the actual cost of developing it, it will be more expensive in the territory of the Southern Power Co. in North and South Carolina than the power they could develop in North and South Carolina by making a similar investment there. Now, that is what he said, according to your outline. I believe that is what he said in his letter.

Mr. FIELDS. Yes.

Mr. HAMMITT. Now, in the case of Mr. Ford, Mr. Ford does not propose to develop this power. What Mr. Ford proposes is that the United States Government develop it.

Mr. FIELDS. But the point I am making is that Mr. Ford—

Mr. HAMMITT (continuing). And then, after the United States Government develops it, he proposes that the United States Government insure it, and that every bit of indefinite obligation regarding it which he can not measure, shall be carried by the United States Government, and he proposes even to require the United States Government to put in more electrical generating equipment than, except during very brief periods of the year, could be used, and then he proposes to pay the United States Government a definite, fixed rental for it.

Now, you have had an analysis of how Mr. Ford comes out on that proposition made by a very eminent water-power engineer on whose judgment, by the way, I think it has been the habit of congressional committees to rely rather more than even on the judgment of Mr. Duke.

Mr. FIELDS. I will say that while listening to that testimony, I thought—

Mr. HAMMITT (continuing). And upon analysis—do you want to permit me to finish my sentence?

Mr. FIELDS. All right; go ahead and finish your statement.

Mr. HAMMITT. And upon that analysis it must be perfectly apparent to the committee that Mr. Ford is getting, if he gets this proposition accepted, the cheapest power on the American Continent, and getting it at the expense of the United States Treasury.

Mr. FIELDS. But it still remains true that Mr. Duke contended in his letter that power could be sold more cheaply in North Carolina than it could be produced at Muscle Shoals.

Mr. HAMMITT. No; he never said anything of the sort.

Mr. FIELDS. Well, his letter speaks for itself.

Mr. HAMMITT. Yes; his letter speaks for itself.

Mr. FIELDS. And it is in the record.

Mr. HAMMITT. Yes, sir.

Mr. FIELDS. Now, you have repeatedly said that Mr. Ford could not produce fertilizer there and compete with the other fertilizer manufacturers. If he can not, why fear him as a competitor?

Mr. HAMMITT. Because his losses would be made up out of the Government Treasury, in the first place. That is the main point. I have never said that Mr. Ford could not operate that plant and make fertilizer and sell it at a loss, provided he could put one hand into the Government Treasury to dip out an amount sufficient to make up that loss and pay him a profit on top of that.

Mr. FIELDS. I can not agree with you that he is putting one hand into the Treasury. He is paying interest upon the investment essential to the completion of it, and if we do not go on and complete it, if we take the advice of your

Mr. Duke and do not complete it, we lose all we have put in, so it is gone anyhow; and if we go ahead and complete it Mr. Ford pays 4 per cent interest, and other substantial fees in connection therewith, upon the amount necessary to complete it.

Mr. HAMMITT. Well, all I can say regarding that, Congressman, is that my analysis of the Ford proposition and your analysis differ.

Mr. FIELDS. I think they do. On yesterday you stated, Mr. Hammitt, it was your understanding that the Secretary of War would not have sent the Ford proposition to Congress if he had believed it would be accepted by the Congress. I am sort of curious to know how you reached that understanding.

Mr. HAMMITT. I am quite sure if I made any such statement as that I was not aware of it at the time.

Mr. FIELDS. I am quite sure you did.

Mr. HAMMITT. If I made any such statement I want to withdraw it because I have no such thought.

Mr. FIELDS. I noticed it created a great deal of interest in the room, and we were all anxious to know just how you had arrived at that understanding, that the Secretary of War would not have sent Mr. Ford's proposition to Congress if he had thought it would have been accepted.

Mr. HAMMITT. If I made any such statement I hope I may have an opportunity to eliminate it from the record, because I certainly had no such thought.

Mr. FIELDS. That statement was made, and I shall object to its being withdrawn. If necessary, I will call for the stenographer's notes.

Mr. WRIGHT. If he wants to explain it, that is all right.

Mr. HAMMITT. Let me say this: I do not believe I ever made such a statement. I do not believe you will find it in the stenographer's notes. But if I did make it, it does not accord with anything I believe, and if I made it I must have been suffering from some kind of mental aphasia when I made it. I do not want the statement to appear as representing my views. I do not believe I ever made it, or that anybody ever got it from anything I said.

The CHAIRMAN. The stenographer's notes will show what was said.

Mr. CROWTHER. It seems to me, Mr. Chairman, that the gentleman ought to have a chance at least to explain it. Very frequently, during the course of our hearings, when a Member makes an unusual statement, he asks that it be not for record. When we reserve to ourselves this unusual privilege, it seems to me it is only fair to extend the same privilege to the witness.

Mr. FIELDS. I am not being unfair; I was seeking an explanation of the statement that was made.

Mr. HAMMITT. My explanation would be that it is not true.

The CHAIRMAN. If the statement was made, the notes of the reporter will show it, and we will have the transcript of the notes in order to determine just exactly what was said. But I think in all fairness, the witness's attention having been called to the alleged statement, he should have a right to explain the statement.

Mr. FIELDS. I do not object to that, Mr. Chairman. I do object to its being withdrawn from the record. He has a perfect right to explain it. I want some information.

Mr. PARKER. Can he not take it back now and say he did not mean it?

Mr. GARRETT. If he was not stating a fact yesterday and says he has stated a fact to-day, he has the right to say so. That is always the rule in regard to evidence. A witness can say that he was not telling the truth on yesterday, and that to-day he is telling the truth.

The CHAIRMAN. I do not think that is quite fair.

Mr. GARRETT. Or that the statement he made yesterday was not correct, and that the statement he is making to-day is correct.

The CHAIRMAN. That is a little better, because, after all, when a gentleman appears before a committee like this committee he certainly should be treated with proper respect. If he has made a statement and it is in the record, and subsequently his attention is called to it and he says it was wrong, he can make any explanation of it that he thinks is necessary.

Mr. FIELDS. An explanation was what I was asking for.

The CHAIRMAN. He should be allowed to correct the statement, but he should not be allowed to withdraw the statement.

Mr. FIELDS. Frequently in the revision of remarks, when a question has not been raised, statements are often withdrawn.

The CHAIRMAN. Of course, some men make statements when they correct the transcript for printing—put in things they never said at all.

Mr. FIELDS. And they withdraw some things that they did say.

The CHAIRMAN. Yes.

Mr. GREEN. May I suggest that all of this colloquy is based, not upon the record but upon somebody's recollection of the record. We will not get anywhere until we have the record before us, and then we can see whether it was said or not.

The CHAIRMAN. I have said the record will be transcribed by the reporters as speedily as possible, and we will find out exactly what was said at yesterday's hearing.

Mr. FIELDS. I am through, Mr. Chairman.

Mr. QUIN. Mr. Hammitt, where are you from, please, sir; what State?

Mr. HAMMITT. New York.

Mr. QUIN. Reared there?

Mr. HAMMITT. Yes, sir.

Mr. QUIN. Who were the 10 gentlemen who composed the organization of the Air Nitrates Corporation? Give their names.

Mr. HAMMITT. I think you are referring, Congressman, to the 10 men whose services were delivered to the Government without charge under the Air Nitrates Corporation's contract. Those men did not form the Air Nitrates Corporation, as I explained yesterday, but it was formed by the American Cyanamid Co.

Mr. QUIN. Who were the 10 stockholders of that corporation? The testimony is that there were 10 stockholders who put in \$100 each.

Mr. HAMMITT. That testimony is in error. There is only one stockholder and that is the American Cyanamid Co., and that stockholder owns all the stock. None of these 10 men to whom you refer owns a dollar of stock in the Air Nitrates Corporation, ever received a dollar of compensation from the Air Nitrates Corporation, or ever has had or will have any interest in any possible profits of the Air Nitrates Corporation unless he gets it as a stockholder of the American Cyanamid Co.

Mr. QUIN. Please give us the names of those 10 men you speak of.

Mr. HAMMITT. Those 10 men are Mr. Frank S. Washburn, whose address is Rye, N. Y.; Mr. K. F. Cooper, whose address is Great Neck, Long Island, N. Y.; Mr. O. G. Bond, whose address is at Great Neck; Mr. George A. Hendrie, whose address is Great Neck; Mr. W. S. Stoll, whose address is Rye, N. Y.; Mr. W. S. Landis, whose address is New York City; Mr. George E. Cox, whose address at that time was Niagara Falls, N. Y.; Mr. J. J. Elbert, now deceased; and Mr. R. C. Greene, whose address I think is New York City.

Mr. QUIN. Was Mr. Cooper the same gentleman, the engineer, who testified before this committee a few days ago?

Mr. HAMMITT. No, sir.

Mr. QUIN. They are different men?

Mr. HAMMITT. Entirely different men, and they are not related to each other in any way whatever. You heard Mr. Hugh L. Cooper, and this gentleman I just referred to is Mr. Kenneth F. Cooper.

Mr. QUIN. What time did Mr. Washburn cease to be president of the Alabama Power Co., if you know?

Mr. HAMMITT. I would like, if you want to get that date accurately, to look it up for you. I think it probably was in 1914 or 1915.

Mr. QUIN. What company did you leave to go with the American Cyanamid Co.?

Mr. HAMMITT. I was engaged immediately before I entered the employ of the American Cyanamid Co.—I was employed by Air Nitrates Corporation; immediately before I went to the Air Nitrates Corporation I was engaged in an electrical manufacturing business in which I was a stockholder, a very small business.

Mr. QUIN. You have been with the American Cyanamid Co. since the operation of the Air Nitrates Corporation began at Muscle Shoals?

Mr. HAMMITT. Yes, sir. I spent about seven months at Muscle Shoals on the construction of the Muscle Shoals nitrate plant.

Mr. QUIN. How long a time was the Air Nitrates Corporation engaged in its designing and construction work at Muscle Shoals?

Mr. HAMMITT. The work began in November, 1917—that is, the work of designing. The first ground was broken, as I remember, in March, 1918. The construction was substantially completed and the first product came through the plant, as I remember it, in November, 1918. There was a test operation after that, and a certain amount of finishing-up work that ran over into the

spring of 1919. Now, I should say there were probably 15 or 16 or 17 months, something of that sort, spent on that work altogether.

Mr. QUIN. The Virginia-Carolina Chemical Co. and Mr. Duke own a majority of the stock of the American Cyanamid Co. do they not?

Mr. HAMMITT. No; if you add their stockholdings together you get a very small fraction under one-half.

Mr. QUIN. What stock did Mr. Washburn own in the American Cyanamid Co.?

Mr. HAMMITT. I do not know.

Mr. QUIN. He owns considerable stock, I presume, being president of the company.

Mr. HAMMITT. I do not know the extent of his stockholdings.

Mr. QUIN. Is that the same Mr. Duke who sent the communication to Gen. Beach, Chief of Engineers, of the War Department, as testified during these hearings?

Mr. HAMMITT. Yes; and he sent that communication as the president of a power company.

Mr. QUIN. Of the Southern Power Co.?

Mr. HAMMITT. Yes, sir.

Mr. QUIN. The Southern Power Co. is linked up with the Virginia-Carolina Chemical Co., is it not?

Mr. HAMMITT. Not in any way that I know of.

Mr. QUIN. Is not the Virginia-Carolina Chemical Co. the big high priest in the fertilizer combination or trust?

Mr. HAMMITT. It is one of the largest fertilizer manufacturing companies. I do not believe that under the usual definition of a trust there is such a thing as a fertilizer trust.

Mr. QUIN. It is too cheap, I suppose?

Mr. HAMMITT. You mean the fertilizer is too cheap?

Mr. QUIN. Yes.

Mr. HAMMITT. I do not think that has very much to do with it. I think the point is that there are a great many different fertilizer manufacturers, and one of the largest of them is the Virginia-Carolina Chemical Co.

Mr. QUIN. With Mr. Duke's connection with your company, and the Virginia-Carolina Chemical Co. having all that stock in it, they naturally have a dominating influence in the American Cyanamid Co., do they not?

Mr. HAMMITT. I have no knowledge of Mr. Duke's connection with the Virginia-Carolina Chemical Co. Where did you get that, Congressman? I do not remember anything about that. I certainly have not given any evidence to the effect that Mr. Duke controls the Virginia-Carolina Chemical Co., and to the best of our knowledge he does not. I do not know of any such connection.

Mr. QUIN. These concerns are all hostile to the Government completion of that business and the acceptance of Mr. Ford's proposition to take over and operate that plant, are they not?

Mr. HAMMITT. I do not know the attitude of the other companies, besides the American Cyanamid Co. and the Air Nitrates Corporation. I should think the Virginia-Carolina Chemical Co. would be very much concerned about any proposition to introduce a Government-subsidized competition into the fertilizer industry, but I can not figure out any particular reason for any special interest in the Ford offer on the part of the Southern Power Co. I do not really know what their attitude is.

Mr. QUIN. The proper department of the Government issued an invitation for all who will to come and bid on that Muscle Shoals property, did it not? That was a general invitation?

Mr. HAMMITT. It was advertised as a general invitation, and a special invitation was sent to quite a considerable number of companies.

Mr. QUIN. And Mr. Ford is the only one of all the concerns in the United States who made a concrete proposition to the Government, and that is before this committee at this time; is that not true?

Mr. HAMMITT. My understanding is that there are other propositions, but that is the only one now before the committee.

Mr. QUIN. I mean it was the only one before the committee up to the time the committee began to consider it?

Mr. HAMMITT. I understand that is the only one before the committee.

Mr. QUIN. Mr. Ford, through his representatives, testified here that this plant could produce fertilizer at 50 per cent less than it is being produced for to-day and you gentlemen contradict that. What basis have you for your contradiction of what his experts say?

Mr. HAMMITT. We have not said Mr. Ford could not make fertilizer at Muscle Shoals at any particular price, but we have said we do not believe that there is any way that the Muscle Shoals nitrate plant could be effectively used for the production of fertilizer on a basis on which you can sell your product in the American market without sustaining a loss. We do not want to enter into any controversy with Mr. Ford regarding any plans he has. We just express our opinion that we do not think that he can make a profit out of the operation of the nitrate plant, and he has expressed the view that unless he makes a profit he will stop operating.

I have explained in considerable detail to the committee, and I am answering in that way because I do not believe you want me to go all over it again, what I think the plant will produce, and what market they have, and what it will cost for the production. I do not believe you want me to go over that again.

Mr. QUIN. Mr. Ford is backing up his talk with money, is he not?

Mr. HAMMITT. I do not know how you want to interpret it.

Mr. QUIN. His engineer testified here that he was going to put up forty or fifty million dollars down there.

Mr. HAMMITT. I am sure you would not want to make a contract, considering as part of the terms of the contract the testimony of Mr. Ford's representative before the committee. You have not even put me under oath, and I do not suppose you put him under oath.

Mr. QUIN. No; we have faith in the integrity of the gentlemen who come before this committee.

Mr. HAMMITT. Yes; and I presume you also have in mind that you are asked to make a contract with a corporation which will live for a hundred years, and Mr. Ford can not possibly have an active life of more than 15 years longer, so that you have the great bulk of the hundred years period, 85 years, when you will be dealing with somebody else, and you do not know now who he is. I frankly think your confidence may possibly be misplaced, if it is placed entirely in Mr. Ford.

Mr. QUIN. Yes, sir; but this is not 10 men with a hundred dollars apiece that we are dealing with now. The Air Nitrates Corporation is composed of 10 men. Did they put up the hundred dollars apiece? There is no evidence that they paid the \$1,000 in there.

Mr. HAMMITT. I wonder if it is necessary for me to state again that the 10 men to whom you refer, whose names at your request, I have read into the record, did not organize the Air Nitrates Corporation, do not own a penny of the stock of the Air Nitrates Corporation, and never did; and never received a penny of compensation from the Air Nitrates Corporation, and, so far as I know, never will, and can not possibly get any profit out of the Air Nitrates Corporation unless they get it as stockholders in the American Cyanamid Co., which is the only way anybody can ever get any profits out of the Air Nitrates Corporation, if it made those profits.

Mr. QUIN. But, Mr. Hammit, your contract states that this Air Nitrates Corporation was formed for the special purposes of avoiding liability of the Cyanamid company. That is stated in plain language, so its assets would not be responsible.

Mr. HAMMITT. That is one of the reasons why it was formed.

Mr. QUIN. Now, after that corporation was formed, with no assets back of it except a thousand dollars, it undertakes to deal with the 100,000,000 people of the United States, and in that deal it has had itself called the agent of the United States under the terms of the contract; is that not true?

Mr. HAMMITT. It was called the agent under the terms of that contract.

Mr. QUIN. And then this agent of the United States with no assets to back it up went into a deal by which the Government was to put up all the money, and this thousand dollar corporation was to receive a fee which amounted to \$1,500,000 for the designing and construction of the nitrate plant.

Mr. HAMMITT. There was that and some other things connected with it, all of which I have explained to the committee, not once, but many times, the net result of which was that the corporation did not make one penny out of the operation.

Mr. QUIN. How much remains unpaid of the fee of \$1,500,000?

Mr. HAMMITT. My recollection is that it is something over \$300,000.

Mr. QUIN. Then there has been about \$1,150,000 or \$1,200,000 paid on that fee?

Mr. HAMMITT. I have not the exact figures; I think they are in the record. I think you went over this matter with the officers of the Ordnance Department, and that is in the record.

Mr. QUIN. What lawyer representing the Government was present when the contract was signed?

Mr. HAMMITT. I can not say.

Mr. QUIN. Was there any lawyer for the United States Government participating in this deal?

Mr. HAMMITT. I have no doubt there was.

Mr. QUIN. What is the name of the Army officer?

Mr. HAMMITT. You mean who signed the contract?

Mr. QUIN. Yes.

Mr. HAMMITT. Col. Samuel McRoberts.

Mr. QUIN. Was he the one who began negotiations, or was that Col. Joyes?

Mr. HAMMITT. My recollection—now, as a matter of fact, Congressmen, I had no personal contact with those negotiations, and the committee directed me yesterday to prepare and put in the record a statement showing who were the parties representing the different sides in this negotiation, and I hope you will let me prepare that statement and submit it to the committee in the record.

Mr. QUIN. That will be satisfactory. Is Col. McRoberts in the Army now?

Mr. HAMMITT. No; I think not.

Mr. QUIN. Was he an emergency officer?

Mr. HAMMITT. Yes, sir.

Mr. QUIN. Where was he from?

Mr. HAMMITT. My recollection is that he was vice president of the National City Bank before he went into the Government service.

Mr. QUIN. You mean the National City Bank of New York?

Mr. HAMMITT. Yes, sir.

Mr. QUIN. That is the Standard Oil—Rockefeller—bank is it not? What position did he hold with that bank?

Mr. HAMMITT. I have stated that to the best of my recollection he was vice president of that bank.

Mr. QUIN. Is he there now?

Mr. HAMMITT. I am sure I do not know.

Mr. QUIN. The other gentleman who signed the contract with the Alabama Power Co. was named Williams, I believe. He was out of that same bank, the testimony shows. Did you come in contact with him in your dealings?

Mr. HAMMITT. I did not come in contact with him, and I do not know of Col. Williams as being with the National City Bank. Perhaps you are correct.

Mr. QUIN. That is the testimony. It was testified that he was fixing to sail for the Orient.

Mr. HAMMITT. Yes, sir.

Mr. QUIN. You do not know whether Col. McRoberts is with that bank, or where he is now. You stated you did not know, I believe.

Mr. HAMMITT. No; I do not know. He is a banker by profession, and I presume he is somewhere in the banking business.

Mr. QUIN. That is a contract made on the part of the United States by Col. McRoberts, vice president of the National City Bank of New York, with the Government's own agent, a thousand-dollar corporation, under the terms of the contract, to carry on a work that cost how much in round figures?

Mr. HAMMITT. About \$67,000,000 at this particular plant, and the total amount of work done under that contract amounted to about \$100,000,000.

Mr. QUIN. The report of the War Expenditures Committee was made on this project. Are you familiar with that?

Mr. HAMMITT. I have read the report; yes, sir.

Mr. QUIN. It speaks of wild extravagance down there in that construction work on which this amount of money was expended.

Mr. HAMMITT. Congressman, I want to tell you perfectly frankly, I believe I have a great deal more confidence in the sanity, and truthfulness—and I do not mean that in any invidious sense—but I mean the fairness in presenting the facts contained in the minority report by Mr. Garrett, of Tennessee, the minority representative upon that subcommittee, than the majority report regarding the work at Muscle Shoals. In connection with the work at Muscle Shoals, from my familiarity with the work there, I can say it was a job that I personally am proud to have been connected with.

Mr. QUIN. Even Mr. Garrett did not praise it very much, did he?

Mr. HAMMITT. Yes; he did praise it very highly.

Mr. QUIN. Did he say that that money was nicely and wisely expended there? His report is on record here. Did Mr. Garrett say that money was wisely, properly, and efficiently expended?

Mr. HAMMITT. If he had said that he would have said a thing that all of us know could not have possibly been done on a job of that size, where you went into 4 square miles of corn and cotton fields, without adequate roads, without railroad facilities, and in a period of eight months and eight days after breaking ground delivered in operation a nitrate plant which was the largest manufacturing plant of that kind in the world. If anybody thinks that money spent on a job done under pressure like that in wartime was efficiently expended, I should say he had not much practical experience with that kind of work. Of course, it was not economically and efficiently expended, all of it. The main thing is that we had a program to meet, and it was a difficult program to meet. We had a job to deliver a plant that would meet the requirements that had been allocated to us in connection with the 1919 campaign for explosives. We had the very difficult job of getting it through on time. But we did get it through, and if we had not done the best we could in the designing and construction of that plant and had not delivered to the Government a good plant that would work, it would not be necessary for me to-day to plead against the use of that plant to destroy the company that designed and built it.

Mr. QUIN. You said, I believe, that none of those 10 men was on the pay roll of the Government in connection with that work. Is that correct?

Mr. HAMMITT. That is correct.

Mr. QUIN. The war expenditure committee shows here in its hearings the list of the gentlemen who did not receive salaries from the American Cyanamid Co.

Mr. HAMMITT. You mean from the Air Nitrates Corporation.

Mr. QUIN. No; it says from the American Cyanamid Co. That was the one that was the beneficiary, as you said. I notice here the names of Mr. Frank Washburn, Mr. K. E. Cooper, Mr. W. E. Bond, Mr. W. S. Landis, and Mr. R. D. Greene. Then it gives a list of those who did receive salaries from the United States. I presume that is correct?

Mr. HAMMITT. I presume it is.

Mr. QUIN. Do you know Capt. Marberly.

Mr. HAMMITT. I do not think I know him, personally.

Mr. QUIN. He was the gentleman who gave the evidence. He was in charge of the Ordnance Department work in connection with the Air Nitrates Corporation?

Mr. HAMMITT. He was the disbursing officer.

Mr. QUIN. With that construction work under that contract, the Air Nitrates Corporation, the agent of the Government made this contract to hog tie the Government after the Government's activities in war, did it not? In other words, to make it so the United States could not dispose of it, except through the Air Nitrates Corporation, or the American Cyanamid Co., for that is the one it was dealing with.

Mr. HAMMITT. As has been rather frequently stated, the Air Nitrates Corporation negotiated this contract with the Government containing article 19, which you described, the theory being that it would do as you say, although I would not describe it in exactly the same way.

Mr. QUIN. Do you not know that there is a very well-founded law that the agent can not bind the principal for himself against the interest of the principal?

Mr. HAMMITT. I am not a lawyer, and I do not want to discuss principles of law because they are things, frankly, with which I am not familiar.

Mr. QUIN. You say there is a moral obligation for the Government to stand by this contract made under the circumstances that have been related in the evidence before the committee. Do you think that is true, that it is a moral obligation on the part of the Government to do that now?

Mr. HAMMITT. I surely would not have stated it so many times unless I believed it was true. I do believe it is true.

Mr. QUIN. It is natural for you to feel that way, as an interested party, speaking for the principal. You admit that. We are the representatives of the people and you are representing the American Cyanamid Co. and the Air Nitrates Corporation.

Mr. HAMMITT. Your statement regarding whom we represent in this proceeding is quite correct, and I will say the people are very well represented.

Mr. QUIN. If we can not believe in this anomalous situation that has developed here, of the principal being bound by the acts of the agent in this situation, you can not censure us, can you?

Mr. HAMMITT. I certainly could not censure you.

Mr. QUIN. Is it not fair to assume that the great mass of the American people could not feel that they are honestly and morally bound to stand by such a proposition?

Mr. HAMMITT. I believe that, being familiar with the facts, a great majority of the American citizens being educated in the principles of fair play and in the private and public policy of living up to agreements, would take the same position that I have taken before the committee, and if I did not believe that position could be sustained I would not have the temerity to urge it before this committee.

Mr. QUIN. Then, you would agree to the fact that a thousand dollar corporation should handle a \$67,000,000 construction and work, with a fee of \$1,500,000 to cover the construction of it, and then \$560,000 for operation—you believe that would smell good to them? That is what it means.

Mr. HAMMITT. I do not think they would have to analyze that contract with the use of the olfactory nerve at all.

Mr. QUIN. The fact that Mr. Ford has made this proposition and that he has made good on all undertakings in which he has engaged has naturally aroused those interests with whom he would come in competition, has it not?

Mr. HAMMITT. I think it seems to have excited a very general interest.

Mr. QUIN. If Mr. Ford could carry out the contemplated plans there, as testified before this committee, to the great benefit of the American people, you would not characterize that as any subsidy out of the Treasury of this country, would you?

Mr. HAMMITT. Not unless it were a subsidy.

Mr. QUIN. I had not heard of this proposition of a single dollar going into his pocket on any subsidy. The Government completes the dam and then builds another dam. Mr. Ford pays interest on it, and through his payments on the amortization fund he pays it all back, and the great benefits that may flow from that would amount to a great deal more, some of us believe, than the Government would be out in the completion of that work. Is that not true?

Mr. HAMMITT. I do not agree with that analysis.

Mr. QUIN. Then you say you do not believe in any kind of a subsidy. That is, I take it, you do not believe in the railroad subsidy that was paid to some of the southern roads and the subsidy we are talking about now paying to American ships. You do not believe in that?

Mr. HAMMITT. If you consider that pertinent to the inquiry, I will be very glad, if that is what the committee desires, to express my views with regard to railroad and ship subsidies.

Mr. QUIN. Just answer that yes or no.

Mr. HAMMITT. The thing is much too complicated to be answered in that way. It is a subject which involves a great deal of discussion on the floor of Congress, where there are men very much more able to discuss it than I am, and they can not dispose of it with one word on each side.

Mr. QUIN. That is very true, but you did dispose of this proposition of Mr. Ford's by calling it a subsidy.

Mr. HAMMITT. I have been on the witness stand since 10.30 o'clock yesterday morning rather continuously, and I am sure I have said more than one word, and some words I have said over again many times. That is the uneconomical part of it, in my opinion.

Mr. QUIN. Mr. Duke expressed himself in rather a violent manner toward this proposition in his letter to the War Department, did he not?

Mr. HAMMITT. My recollection of the letter which, as I say, I never saw until I read it in the record—

Mr. QUIN (interposing). Inadvisable and foolish are the terms he used.

Mr. HAMMITT. It does not indicate any violence. That is the impression I got from reading the letter.

Mr. QUIN. You did not gather the impression that he was very friendly toward the Government doing that work down there, did you?

Mr. HAMMITT. I gathered that he recommended very positively against the wisdom of the Government doing it.

Mr. QUIN. Then the position assumed by you under this contract by the Air Nitrates Corporation, is that it was a proposition of heads I win and tails you lose in talking with the Government. Was that not the exact kind of deal it was?

Mr. HAMMITT. No, sir.

Mr. QUIN. Then, when they got that fee, if the Government started to sell : and was bound not to do it under such a contract as was made there, you say it that that was a fair contract?

Mr. HAMMITT. I do; yes, sir.

Mr. FISHER. Will you kindly give us the name of the lawyers employed by the Air Nitrates Corporation or by the American Cyanamid Co. that approved the first agreement which you proposed to submit to the Government for signature?

Mr. HAMMITT. My impression is that the law firm who represented us in these contract matters was the firm of Sullivan & Cromwell.

Mr. FISHER. Were they your legal advisers up until the day of the signing of the contract, which the evidence here shows was dated in June, 1918?

Mr. HAMMITT. They were.

Mr. FISHER. Did you have other law firms besides Sullivan & Cromwell advising you; I mean about the contract for the nitrate plant No. 2?

Mr. HAMMITT. That clears the question. I believe we had no one, except as I have stated before the committee, that on a special question we called in Justice Hughes.

Mr. FISHER. Can you give us the date when the services of Justice Hughes were retained by your corporation?

Mr. HAMMITT. I can not give the date now, but I will be glad to supply it.

Mr. FISHER. At that time he was practicing law in New York, and was considered one of the ablest lawyers in New York?

Mr. HAMMITT. Both of those things are true.

Mr. FISHER. You submitted to him a proposition that had given your former law firm difficulty, did you not?

Mr. HAMMITT. Undoubtedly.

Mr. FISHER. And that was relating to the matter you have discussed, article 19 of the final contract?

Mr. HAMMITT. Yes, sir.

Mr. FISHER. On so vital a matter to your corporation you certainly got a written opinion from Justice Hughes about that particular matter, did you not?

Mr. HAMMITT. We did not.

Mr. FISHER. Well, he gave an oral opinion to whom?

Mr. HAMMITT. His opinion was expressed in a conference, in which the form of protection that would be extended to the American Cyanamid Co. in this contract was agreed upon. Now, I can not state to you who was present in that conference.

Mr. FISHER. You were not present?

Mr. HAMMITT. I was not present.

Mr. FISHER. Was that conference held in New York City or in Washington?

Mr. HAMMITT. I can not even state whether it was in New York City or in Washington.

Mr. FISHER. As a matter of fact, it was so vital to the corporation that they employed a very distinguished lawyer. Could you give us the name of one of the officers of your corporation, or either corporation, who was present at this important conference?

Mr. HAMMITT. I imagine that undoubtedly Mr. Washburn, the president of the company, was present, and as you understand, Congressman, the reason I appear here in place of Mr. Washburn is that it is absolutely impossible for him to attend to business on account of the present state of his health, and that has been the situation for a year. I may be an unsatisfactory witness to the committee in some respects by not having anticipated some of the things the committee might want, but if there is any detail about these negotiations and the history of them that you would like to have me submit a statement of I will be glad to do it.

Mr. FISHER. Understand, I am not criticizing you as a witness, but I would like to have the name of some person who could testify as to what happened at that important conference.

Mr. HAMMITT. Those records, of course, are just as available in the Ordnance Department as they are in the recollection of anyone who attended that conference.

Mr. FISHER. That is not the question I asked you. There was a private conference when Judge Hughes was present, and there was a serious matter presented which had not been solved by your former lawyers, a very distinguished law firm in New York City. I would like to have the name of one of the officers of your corporation that was present to discuss that serious problem other than that of the man who is now unable to testify.

Mr. HAMMITT. I do not know that there was any other officer of the American Cyanamid Co. or the Air Nitrates Corporation present at that conference, and

there were many conferences at that time at which there was no other officer present than Mr. Washburn. Now, then, I have not the least doubt that Col. McRoberts was present at that conference. I have not the least doubt that there were various representatives on both sides, but we are in the unfortunate position that the attorney who did practically all of the work in advising us with regard to this contract, Mr. Rosencrantz, of the firm of Sullivan & Cromwell, is dead, and the officer of the American Cyanamid Co. who responsibly conducted those negotiations has been unable to come to his office because of a condition of health more than ten times, and then not for more than half an hour or an hour and a half or two hours at a time in a period of 15 months, under definite instructions from his physician, so I am sure that his doctors will not be willing to take the responsibility of his coming down here. In substitution for these witnesses who were present in the conferences, as to whom we have not control, so far as I know, of any except those I have mentioned, and the Government has control of plenty who can testify as to what took place, I should be very glad to submit to you any statement of the facts you would like to obtain, and I am very much embarrassed by reason of my inability to answer all the questions.

Mr. FISHER. I simply asked for the name of an officer of the corporation who was present, and you are unable to give any except the man who you say is unable to testify.

Mr. HAMMITT. Because I think he is the only officer of the corporation who was there.

Mr. FISHER. As I understand it, it is the custom to consult a great lawyer on a very technical proposition like this, and in that case is it not the custom that such a lawyer always gives a written opinion on it? Is it not possible that there may be a written opinion that was given by Judge Hughes.

Mr. HAMMITT. No; because I definitely made inquiry about that, knowing that the committee would want to know those facts, and I was definitely informed that there was no written opinion.

Mr. FISHER. May I ask when that inquiry was made, and did you also ask where the conference was held?

Mr. HAMMITT. No.

Mr. FISHER. You neglected to ask that?

Mr. HAMMITT. I did; yes, sir.

Mr. FISHER. Were you present in Washington when the negotiations were had with the Ordnance Department?

Mr. HAMMITT. I was not.

Mr. FISHER. You had nothing to do with that at all?

Mr. HAMMITT. Nothing whatever.

Mr. FISHER. You have expressed in your testimony such a tender sympathy for the taxpayers of the country that I would like to ask you to name in the record the employees of your corporation and the subcontractor corporation whose salaries were paid for as a part of the cost of nitrate plant No. 2, which were in excess of \$5,000?

Mr. HAMMITT. I shall be very glad to submit such a statement.

Mr. FISHER. I should like to submit to you on page 3065 of hearings before a subcommittee of the war expenditures committee, volume 3, serial 6, parts 50 to 59 and 60 to 64, and ask you to examine that list and state whether or not that is accurate.

The CHAIRMAN. What is the title of that document?

Mr. HAMMITT. These are hearings before Subcommittee No. 5 of the Select Committee on Expenditures in the War Department, of the House of Representatives, Sixty-sixth Congress, second session, and this is volume 3, serial 6, parts 50 to 59 and 64 to 66. My attention has been called to page 3065.

The CHAIRMAN. That identifies the document completely for the record.

Mr. HAMMITT. If you want anything more than my general statement that I assume this is correct, I would like to take that and check up the statement and submit a further statement for the record in regard to it.

Mr. FISHER. That would be entirely all right.

Mr. HAMMITT. I will be glad to do that.

Mr. FISHER. I would like you to state the total amount of the fee that your corporation has received from the United States Government for the construction work at nitrate plant No. 2; how much have you collected to date from the United States Government?

Mr. HAMMITT. Approximately, \$1,200,000. I am sure the exact figures are already in the record, because there was a thorough examination on that sub-

ject of the Ordnance Department, and that is one of the reasons why I did not think it necessary for me to inform myself as to the exact figures.

Mr. FISHER. That was a percentage of the total amount paid for the expenses of that work; that was a percentage, a cost-plus contract?

Mr. HAMMITT. That was a cost plus a percentage, with a provision for a maximum fee.

Mr. FISHER. You have expressed an opinion that it would be the best thing for the Government to have that plant in a stand-by condition. The contract provides for a sale. Do you understand that if the Government should determine to lease it and not sell it, that the lessees under the terms of the contract, as you construe it, could operate the processes there by paying the stipulated royalties?

Mr. HAMMITT. No; the United States has no authority to grant a license under these patents to a lessee.

Mr. FISHER. Then do I understand that by process of elimination there is nothing, under your interpretation of the contract, that the Government can do with this proposition except first to get an offer and then submit it to you and let you have six months before you do anything about it.

Mr. HAMMITT. Provided the Government decides to dispose of the plant, it would be necessary for it to follow that procedure, and the time we would have to consider it would be, as provided in article 19 of the contract, a reasonable time, not exceeding six months.

Mr. FISHER. Then as I understand it, according to your interpretation of the contract, there is nothing that the Government can do except to sell it?

Mr. HAMMITT. No; the Government can keep it in stand-by condition, which is what we recommend that the Government do. The Government can operate it. The Government can leave it to somebody who has some idea of operation, that does not involve the patents of the American Cyanamid Co.

Mr. WRIGHT. What was your compensation growing out of this contract for the construction of the plant?

Mr. HAMMITT. I received during the period of time that I was engaged on this work for the Air Nitrates Corporation, a compensation of \$7,500 a year.

Mr. WRIGHT. You were paid by the Government?

Mr. HAMMITT. I was paid by the Air Nitrates Corporation out of Government funds.

Mr. WRIGHT. Mr. Hammitt, you have been asked a great deal about article 19 of this contract. Boiled down to its last analysis, it means one thing, and that is that the American Cyanamid Co. at the time this construction was contemplated had a monopoly of that industry in the United States, or practically a monopoly?

Mr. HAMMITT. They had an absolute monopoly of the manufacture of cyanamid, and the marketing of cyanamid, and manufacture by the cyanamid process.

Mr. WRIGHT. That being true, it was the purpose of article 19 to enable the American Cyanamid Co. to continue that monopoly?

Mr. HAMMITT. Except under the conditions as provided in that article under which the United States may license another purchaser to operate that plant under those patents.

Mr. WRIGHT. You had the privilege of becoming the purchaser upon as favorable terms as anyone else?

Mr. HAMMITT. We did.

Mr. WRIGHT. By accepting the terms of that article you could continue to maintain your monopoly?

Mr. HAMMITT. Yes, sir.

Mr. WRIGHT. The Virginia-Carolina Chemical Co. is engaged in the production of commercial fertilizer?

Mr. HAMMITT. Yes, sir.

Mr. WRIGHT. What percentage of the stock of the American Cyanamid Co. did you say that company owned?

Mr. HAMMITT. Approximately 26 per cent.

Mr. WRIGHT. The Virginia-Carolina Chemical Co. of course is a large customer of the American Cyanamid Co.?

Mr. HAMMITT. Yes, sir.

Mr. WRIGHT. You furnish them with a product that enters into the manufacture of fertilizer?

Mr. HAMMITT. We do.

Mr. WRIGHT. Will you secure and place in the record the names of the gentlemen in the American Cyanamid Co. who own stock in the Virginia-Carolina Co., and state the amount which each one owns.

Mr. HAMMITT. I do not know whether I can get access to the stock lists of the Virginia-Carolina Chemical Co. I can do this: I can make inquiry of all the directors and all the executive officers of the American Cyanamid Co., and I am sure they will all be very glad to inform me what stock they own, if any, in the Virginia-Carolina Chemical Co., and I would be very glad to give you a statement in regard to that.

Mr. WRIGHT. Likewise, can you secure such a list of the stockholders of the Virginia-Carolina Chemical Co., who own stock in the American Cyanamid Co.?

Mr. HAMMITT. I would not like to say for certain that I could, because, of course, I would be asking for information from men who were not my associates in business, and, while I can not conceive of any reason why they should be unwilling to furnish that information, I can not say definitely that I can do that.

Mr. WRIGHT. It is your understanding that it is a fact that some of the stockholders of one company owned stock in the other and vice versa?

Mr. HAMMITT. I think it is possible, just the same as it is entirely possible that some of the stockholders in the American Cyanamid Co. have stock in the Pennsylvania Railroad Co., but there is no corporate connection between the two, other than that which is indicated, which, of course, is a substantial one, namely, that the Virginia-Carolina Chemical Co. itself owns 26 per cent of the stock of the American Cyanamid Co.

Mr. WRIGHT. Mr. Washburn was once president of the Alabama Power Co. was he not?

Mr. HAMMITT. He was; yes, sir.

Mr. WRIGHT. Does he own any stock in the American Cyanamid Co.?

Mr. HAMMITT. That is a question which I thought might be asked, so I made an inquiry about that. He does not.

Mr. WRIGHT. Not in the American Cyanamid Co.?

Mr. HAMMITT. I thought you said the Alabama Power Co. He does own stock in the American Cyanamid Co., but how much I do not know.

Mr. WRIGHT. He has disposed of his stock in the Alabama Power Co.?

Mr. HAMMITT. I understand he has sold all of his holdings in the Alabama Power Co.

Mr. WRIGHT. Do you know how many members or stockholders of the American Cyanamid Co. own stock in the Alabama Power Co. now?

Mr. HAMMITT. I do not; no, sir.

Mr. WRIGHT. Do any of them own stock in it?

Mr. HAMMITT. I am not aware of any that own any stock, except that as I have stated; I assume that Sperling & Co., who marketed some of our securities, also marketed the securities of the Alabama Power Co., and probably still have some interest in securities of the Alabama Power Co., and they may have a very small interest at the present time in the securities of the American Cyanamid Co. Aside from that particular instance, I have no idea whatever of any individual or group which owns stock in the two companies. There is absolutely no corporate connection or joint control or interlocking of any character between the two companies. They are absolutely separate.

Mr. WRIGHT. You spoke about the American Cyanamid Co. owning a large phosphate plant in Florida.

Mr. HAMMITT. They have phosphate mines in Florida.

Mr. WRIGHT. Is that plant operated in the name of the American Cyanamid Co., or in the name of some subsidiary company of the American Cyanamid Co.?

Mr. HAMMITT. Well, it is operated by the American Cyanamid and in its name, but it has obligations to a subsidiary company to deliver to it a certain amount of material in order to supply the contracts that the subsidiary company had entered into before we acquired the subsidiary company.

Mr. WRIGHT. What is the name of the subsidiary company?

Mr. HAMMITT. The Amalgamated Phosphate Co.

Mr. WRIGHT. How is it as to your operations in California, near Los Angeles?

Mr. HAMMITT. Our ownership in the Owl Fumigating Corporation, while I called it a subsidiary company, amount to 50 per cent of the stock of the Owl Fumigating Corporation, but with a provision under which we are enabled to vote 51 per cent of the stock, so, except as to a division of the profits between the American Cyanamid Co. and the other stockholders, we control the Owl Fumigating Corporation, but when it comes to dividing the profits they get half the profits, and the American Cyanamid Co., as the other stockholder, gets the other half.

Mr. WRIGHT. You said the capital stock of the American Cyanamid Co. is \$12,000,000 and some odd thousand?

Mr. HAMMITT. Yes, sir.

Mr. WRIGHT. How much was actually paid in, and in what way was it paid in, in cash, or property, or what went in to make up the capitalization?

Mr. HAMMITT. I assume that the preferred stock of the American Cyanamid Co. represents actual cash.

Mr. WRIGHT. What does that amount to?

Mr. HAMMITT. That amounts to approximately half of the \$12,000,000.

Mr. WRIGHT. Very well.

Mr. HAMMITT. I assume that the common stock of the American Cyanamid Co. represents a considerable number of intangible assets.

Mr. WRIGHT. Such as patent rights?

Mr. HAMMITT. Largely consisting of such things as patent rights.

Mr. WRIGHT. What is the American Aluminum Co.; where is it located; what does it do; what does it produce?

Mr. HAMMITT. The Aluminum Co. of America is a corporation engaged in the manufacture of aluminum, and it has properties in a number of different parts of the United States.

Mr. WRIGHT. Is there any identity that exists between it and the American Cyanamid Co.?

Mr. HAMMITT. Not the least bit; none whatever.

Mr. WRIGHT. The Alabama Power Co. is financed with Canadian or British capital principally, is it not?

Mr. HAMMITT. I am sure I do not know. I would not like to testify regarding the present financing of the Alabama Power Co. I understand it is the intention of the committee to call representatives of the Alabama Power Co. before it, and they can undoubtedly furnish you with that information.

Mr. WRIGHT. Is it true that the majority of the capital invested in the American Cyanamid Co. is English or Canadian capital?

Mr. HAMMITT. No, sir; it is not true. It is true that probably not more than 10 per cent. or, possibly, as much as 10 or 17 per cent—I have not the exact figures of the stock of the American Cyanamid Co.—is owned in all foreign countries. I have stated to the committee who were the principal stockholders of the American Cyanamid Co., and, of course, it would be quite inconsistent with that fact to indicate any foreign control, because I have told you who the principal stockholders were.

Mr. WRIGHT. I did not know how much of those companies was owned by foreign capital.

Mr. HAMMITT. We know that Mr. James B. Duke, one of the stockholders, is not owned by foreign capital. I am quite certain that the Virginia-Carolina Chemical Co. is a thoroughly American corporation.

Mr. WRIGHT. You do not know how much aid it gets from foreign capital?

Mr. HAMMITT. I have never heard of it getting any. I do not know anything about its financial affairs.

Mr. WRIGHT. You said that the Air Nitrates Corporation was not organized by these 10 gentlemen who have been mentioned here, but it was organized by the American Cyanamid Co. Will you please state just the process that was gone through in the organization of the Air Nitrates Corporation? Where was it chartered, who were the incorporators, or who petitioned the court for a charter? Tell us the details of how it was organized.

Mr. HAMMITT. It was organized under the laws of the State of New York, which provide for the filing of a certificate of incorporation in the State capitol in Albany. The question as to who were the incorporators of that company was a matter of absolute indifference. They could have been officers or they may have been clerks. But they never performed any function except the purely ministerial function of signing their names to the incorporation papers. The stock of the corporation is owned by the American Cyanamid Co. Its charter is undoubtedly on file in the State capitol in Albany, and we undoubtedly have a copy of it, and if the committee would feel better informed by having a copy of it I would be glad to send it to you.

Mr. WRIGHT. It organized after it received its charter, did it not, elected a president and board of directors and other officers?

Mr. HAMMITT. Yes; they elected a president of the company, and the president was Mr. Frank S. Washburn. They elected a number of vice presidents.

Mr. WRIGHT. Who voted the stock in perfecting the organization of the company?

Mr. HAMMITT. I imagine the stock was voted, in perfecting the organization, by a trust officer of some sort, representing the American Cyanamid Co.

Mr. WRIGHT. So the American Cyanamid Co. did all the voting in the organization of that company?

Mr. HAMMITT. Yes.

Mr. WRIGHT. Do you mean to say that the gentlemen acting as officers and directors and shareholders who operated this Air Nitrates Corporation did not own a dollar of stock in it?

Mr. HAMMITT. If it was required under the by-laws to have qualifying stock, then provision was made that the stock should be deposited in their name, and also provision was made that they should never get any benefit from it. All the beneficial interests in any stock of the Air Nitrates Corporation, which, as I have explained to the committee, is not worth anything at all, because it never made any money and never will, is owned by the American Cyanamid Co.

Mr. WRIGHT. Nitrate plant No. 2 at Muscle Shoals cost \$67,000,000, did it not?

Mr. HAMMITT. Yes, sir.

Mr. WRIGHT. Have you any idea what its present value is?

Mr. HAMMITT. That is a very intangible thing, because you have to consider what you are figuring its value for. Its present scrap value, delivered to anybody who would take it with the full privilege of breaking it up or doing anything he wanted, and without any obligation whatever, so that he would just scrap it up for scrap value—I suppose its value would be about 10 per cent of the amount of the investment in it. Indeed I will say that certain parts of the chemical plant would have a scrap value that was exceedingly small, but the power plant itself would have a scrap value that is very high, and when you average the cost up I should say then the scrap value would be perhaps 10 per cent. If you consider it as a means of protecting the Government against a future war emergency, then it may be its value is many hundreds of millions of dollars. You can not tell; that is a thing which this committee would have better judgment on than I would have. But if you consider it as a plant to be operated at the present time by the cyanamid process without a subsidy it has not any value at all.

Mr. WRIGHT. There is a steam plant constructed near nitrate plant No. 2 is there not?

Mr. HAMMITT. Yes; it is a part of the plant.

Mr. WRIGHT. Is it adequate to operate the plant?

Mr. HAMMITT. Yes, sir.

Mr. WRIGHT. Do you know what the horsepower produced there is?

Mr. HAMMITT. Its present installation is 60,000 kilowatts, which amounts to 78,000 horsepower, or, roughly, 80,000 horsepower.

Mr. WRIGHT. That is really a part of the plant, and of course the plant would be useless without power?

Mr. HAMMITT. Without that power or some other kind of power. There is a transmission line running to the Muscle Shoals plant from the Alabama Power Co.'s plant on the Warrior River, 88 miles away, and there is this proposed water-power development.

Mr. WRIGHT. If I understand you correctly, the Air Nitrates Corporation has no plan or idea at present of submitting an offer for nitrate plant No. 2?

Mr. HAMMITT. That is true; yes, sir.

Mr. WRIGHT. They have worked out no plan by which there is in prospect a definite offer to be submitted to the Government?

Mr. HAMMITT. That is true.

Mr. WRIGHT. Your whole idea is that the plant ought to be left in a stand-by condition?

Mr. HAMMITT. That is true; yes, sir.

Mr. GARRETT. Mr. Hammitt, you have been asked almost everything, but there is one thing I should like to have you clear up in my mind. I think I understand the situation fairly well now, except one thing, and that is just about the operation of the Muscle Shoals nitrate plant under the proposition Mr. Ford has submitted. As I understand you you say that if it were operated under that proposition it would destroy the American Cyanamid Co.

Mr. HAMMITT. Perhaps the operation of that nitrate plant would not accomplish the complete destruction of the American Cyanamid Co., but it would certainly injure the American Cyanamid Co. very materially by placing upon the market a product of the cyanamid process, whatever the product of that plant should be.

Mr. GARRETT. You are speaking of fertilizer products?

Mr. HAMMITT. Assuming that they were fertilizer products, it would place on the market fertilizer products of the cyanamid process in competition with our product and produce a market on a basis by which the United States Government assists our competitor financially, and that would very materially injure the American Cyanamid Co.

Mr. GARRETT. Is it your opinion, after investigating the Ford proposition, that if the plant should be installed regardless of Government aid or otherwise, it could be so operated that it would materially reduce the price of commercial fertilizer?

Mr. HAMMITT. Not unless it was sold at less than manufacturing cost, because if you produce a considerable quantity of a fertilizer ammoniate it does not make any difference what it costs you to make it, you have to sell it, and the only thing you can get for it is what the market will pay. While undoubtedly that fertilizer operation at Muscle Shoals would net Mr. Ford a very substantial loss, which he would have an opportunity to recoup out of the power end of his proposition, it would also net the ammonia industry a very material loss by dumping this material manufactured under Government subsidy on the market in competition.

Mr. GARRETT. Then, regardless of whatever system of bookkeeping might be employed by Mr. Ford or his company that he is to organize to operate this plant, it is your opinion that he could and would put a commercial fertilizer on the market that would materially reduce the price?

Mr. HAMMITT. I think it is entirely probable that for a certain period of time, at least, he would put a fertilizer material on the market that would have the effect of materially depressing the market for the fertilizer materials we make. Those fertilizer materials occupy so small a part on the farmer's actual fertilizer that I would not like to testify to the effect that it would materially reduce the price of fertilizer.

Mr. GARRETT. What fertilizer materials does your company manufacture that would be produced by the Muscle Shoals operation?

Mr. HAMMITT. Cyanamid.

Mr. GARRETT. What is that in the make-up of fertilizer? What do you call that in the fertilizer? When you speak of the different component parts of fertilizer, what do you call it then?

Mr. HAMMITT. It is in the fertilizer in the form of units of ammonia; that is, the nitrogenous content of the fertilizer?

Mr. GARRETT. That is the nitrogen?

Mr. HAMMITT. Yes, sir.

Mr. GARRETT. The principal parts of the fertilizer are nitrogen, phosphoric acid, and potash?

Mr. HAMMITT. Yes, sir.

Mr. GARRETT. Usually there is about 2 per cent of nitrogen in the average fertilizer, although some of it ranges as high as 4 per cent?

Mr. HAMMITT. Again, I think it would be better to examine the fertilizer manufacturers in connection with that, but my impression is that 2 per cent is not the average now; it is really a little higher than that.

Mr. GARRETT. At least it may run higher; it runs from 2 to 4 per cent, as a rule?

Mr. HAMMITT. Sometimes it runs as high as 10 per cent.

Mr. GARRETT. The information I am trying to get for my own satisfaction as well as for the record is just how the operation of that plant is going to destroy your concern. I can understand how your concern would be very much opposed to it if it was going to do that, and that is the information I am trying to get. Making a long story short, and you have been on the witness stand for two days, and I know you are tired; I sympathize with you. After you boil this whole thing down, in so far as any money value is concerned, the only real thing of value that the American Cyanamid Co. has now or has ever had in this proposition is the value of the patent rights, is it not?

Mr. HAMMITT. Well, there are a number of things that we contributed besides patent rights.

Mr. GARRETT. I mean when you measure it in dollars and cents. Your contract provides, and you have testified, that the Government was to bear all the expense, and this organization has been so perfected that the Air Nitrates Corporation, which you say is simply a dummy, was to represent and does represent, in fact, the American Cyanamid Co., and the whole purpose of it was that there should never under any sort of circumstances be any financial

charge against the American Cyanamid Co. in the construction of this plant, and it is so stated in the contract.

Mr. HAMMITT. That is one purpose of the creation of the Air Nitrates Corporation.

Mr. GARRETT. When we speak of the Air Nitrates Corporation, it is the same as speaking of the American Cyanamid Co.?

Mr. HAMMITT. That is right.

Mr. GARRETT. So, as a matter of fact, when they went down there, every dollar expended, as provided in the contract, all of the liabilities that might be charged against the Air Nitrate Corporation, were to be borne by the Government of the United States, according to section 10 of the contract, which says that "the United States shall bear all costs and expenses of every character and description." They put that language in there, and it was well drawn, I will say, from the standpoint of the American Cyanamid Co.

Mr. HAMMITT. That is true, to a certain extent. I want to help you to get the record clear, and to make a long story short, and the only respect in which it is not true is that it is provided in the same contract, in Article X, on page 11, as follows: "The agent shall make no charge to the United States for the following things," and those are the things they are to deliver without charge.

Mr. GARRETT. What they furnished without charge were those things mentioned in paragraphs 1, 2, 3, and 4, in Article X, on page 11 of the printed copy of the contract?

Mr. HAMMITT. Yes, sir.

Mr. GARRETT. But that involved no monetary expenditure whatever?

Mr. HAMMITT. Oh, yes; it is a very important monetary expenditure, believe me.

Mr. GARRETT. I mean so far as it is set out here.

Mr. HAMMITT. To deliver over to the Government for a year and a half the services of 10 men for their full time, and 10 very expensive men involves monetary expenditure.

Mr. GARRETT. That was supposed to be taken care of out of the million and a half dollar fee, was it not?

Mr. HAMMITT. If it was supposed to be taken care of out of that fee, it was not. But assume it was taken care of out of that fee, that would merely mean that there had been paid back to the Government everything in the way of a fee that had been paid to Air Nitrates Corporation.

Mr. GARRETT. That resolves itself back into the question of taxes, which everybody had to pay.

Mr. HAMMITT. You bet they did.

Mr. GARRETT. What I am trying to bring out was that instead of the Government making this contract with you and paying you these fees, taking a good part of it back in taxes, if it had commandeered this plant, just as it took the boys who went into the Army, and had said it shall not be a matter of whether you hold or withhold those patent rights, which you only get by virtue of the laws enacted by the Government, they could have commandeered the whole thing and put it at Muscle Shoals. The Government could have done that, could it not?

Mr. HAMMITT. I should think the Government's power during war time possibly might have extended to that point.

Mr. GARRETT. Absolutely; but that course was not pursued. It finally comes about that your rights here are these patent rights referred to on page 34. Is not the principal patent right involved in this controversy included in those mentioned on pages 34, 35, and 36, the one that is numbered 1217247, for the process of making ammonium nitrate and other products, dated February 27, 1917? Is not that the principal one that would be involved in the Muscle Shoals proposition?

Mr. HAMMITT. No; I certainly would not say that.

Mr. GARRETT. What would be the principal ones there?

Mr. HAMMITT. All of them.

Mr. GARRETT. This Ford contract says he is to make ammonium nitrate to a certain capacity, or its equivalent, and that is all.

Mr. HAMMITT. Or its equivalent.

Mr. GARRETT. To the amount of 110,000 tons per annum.

Mr. HAMMITT. That is very much like saying a man will make an amount of cloth equal to so many million ladies' hair nets, because the units are not easily transferrable from one to the other.

Mr. GARRETT. I want to get this clear. I see that that patent I referred to a moment ago was granted on February 27, 1917.

Mr. HAMMITT. Yes.

Mr. GARRETT. Who was the patentee in that case, do you recall?

Mr. HAMMITT. I do not.

Mr. GARRETT. Are not all these patents enumerated here the discoveries of some individual chemist who worked out this process, some one in his laboratory, who sold the patent to the American Cyanamid Co., and they paid him for it in common stock; is not that the usual practice?

Mr. HAMMITT. No; I should say that the majority of these patents were developed by employees of the American Cyanamid Co. through a process of research that was directed by the American Cyanamid Co., conducted in its own laboratory, at its own plants, and financed by it.

Mr. GARRETT. Granting that to be true, as a rule these patent rights are the evolution and the product of the brains of an individual worker in the American Cyanamid Co., some fellow who went off in the laboratory and worked out the process, although being paid a nominal salary, or perhaps a good salary, by the American Cyanamid Co.; it does not make any difference about that. Nevertheless these patents were all the development of some man's brain.

Mr. HAMMITT. Of many of them working in combination.

Mr. GARRETT. When he developed it it was patented in his name, and they usually pay a man who develops a process like that in the common stock of the corporation. That is the usual process in this country.

Mr. HAMMITT. Our arrangement was somewhat different from that.

Mr. GARRETT. You have gone over all that question of the construction of the contract, and I do not care to go into that any further. But following a question by Mr. Miller, if, as a matter of fact, you have a good contract, as you contend you have, and if, as a matter of fact, the Government should accept Mr. Ford's proposition, then you would have your royalties for a period of years, until the patents expired, and that would make a very handsome fee, so far as your company is concerned. If, as a matter of fact, Mr. Hammitt, just between ourselves, here across the table, this company should get this proposition, or it should be turned over to Mr. Ford, and that company should make the amount of material called for, and your company should get \$1,000,000 a year in royalties, would that not be a very good proposition for your company, and would not your company make as much in that regard as it would possibly lose as a competitor of Mr. Ford in the sale of fertilizer?

Mr. HAMMITT. Congressman, I explained at some length yesterday what our views were as to the possibilities of our collecting that money and what effort would be necessary.

Mr. GARRETT. I am assuming that you will do it; of course, if you do not do it, you have lost that much.

Mr. HAMMITT. We will do it, but it is our business judgment that we have better protection, very much better protection, under the provisions of article 19 of our contract than that protection would be for us, and it is our best judgment that our interests can only be properly protected in that way by which it was agreed in the contract that they should be protected—by carrying out the terms of article 19. That is the reason I have taken up a day and a half of the committee's time.

Mr. GARRETT. I understand that to be your position, but you understand that the law department of the War Department does not hold the same view that you do in regard to that contract, and the question of whether Congress would follow it or follow you is a question yet to be solved. That is for future development; but the point I wanted to get at was on the merits of the case, if that contract should stand and Congress should decide you have a good contract, that section 19 is good, in view of the fact that no other company has made an offer, except two offers that have been made by correspondence which have been sent to Members of Congress, if Congress should decide to accept Mr. Ford's proposition and he should go to work on the plant, if your contract is good, you will collect many millions of dollars from your royalties on account of the operation of that plant.

Mr. HAMMITT. There is no doubt we will have an income from royalties.

Mr. JAMES. Mr. Hughes was called in by your company especially in connection with section 19?

Mr. HAMMITT. In connection with the problem that was worked out in section 19.

Mr. JAMES. That language was either drafted or approved by Mr. Hughes. was it not?

Mr. HAMMITT. I do not believe I can say that Mr. Hughes actually passed upon the language itself, but it was approved about in that form and drafted about in that form on the strength of his advice.

Mr. JAMES. He had not been consulted on any previous contract, had he?

Mr. HAMMITT. Not that I know of.

Mr. JAMES. He was not consulted in reference to the contract of November 16, 1917?

Mr. HAMMITT. To the best of my knowledge I think it is undoubtedly true that he was not so consulted.

Mr. JAMES. That contract entered into on November 16, 1917, was for the construction of nitrate plant No. 2, was it not?

Mr. HAMMITT. It was.

Mr. JAMES. Is that a long contract?

Mr. HAMMITT. Approximately the same length as this one.

Mr. JAMES. Was there any article in that contract that resembled section 19 of this contract?

Mr. HAMMITT. There was, yes, sir. It was not in exactly the same form.

Mr. JAMES. It was not quite strong enough?

Mr. HAMMITT. I think it was not nearly so strong as Article XIX.

Mr. JAMES. But the contract on which you built nitrate plant No. 2 you claim did not have any section 19, but had another section, in the contract dated November 16, 1917, and the nitrate plant No. 2 was constructed under that?

Mr. HAMMITT. No. This contract of June 8, 1918, by its terms supersedes the previous contract, and the greater amount of construction work was done after this contract.

Mr. JAMES. You entered into the contract of November 16, 1917, for the construction of nitrate plant No. 2?

Mr. HAMMITT. That contract does not now exist, because it is superseded by this one.

Mr. JAMES. When you took the original contract with the United States you agreed to do certain things under the contract of November 16, 1917?

Mr. HAMMITT. We started under that contract; yes, sir.

Mr. JAMES. According to the contract here, the reason that was changed was for the best interests of the United States?

Mr. HAMMITT. Yes; it was thought better to have—

Mr. JAMES (interposing). It was not thought to be for the best interests of your company; it was for the best interests of the United States, was it not because I note that you state on page 4 that the reason given for changing the contract was in accordance with the best interests of the United States.

Mr. HAMMITT. I think it was undoubtedly considered to be in the best interests of the United States to cover the larger operation by a superseding contract rather than by a supplemental one.

Mr. JAMES. The reason given for changing the contract was that it was necessary to contract two additional plants.

Mr. HAMMITT. That was the occasion for writing the new contract.

Mr. JAMES. That was the excuse?

Mr. HAMMITT. That was the occasion; of course, you had to have another contract, either a supplement to this one or something superseding it.

Mr. JAMES. Was the contract signed on June 16, 1918?

Mr. HAMMITT. Was this one?

Mr. JAMES. Yes. I notice it is stated on page 20 that "In witness whereof, the parties hereto have caused these presents to be executed and delivered, in triplicate, at Washington, D. C., the day and year first above written."

Mr. HAMMITT. That is the 8th of June.

Mr. JAMES. 1918?

Mr. HAMMITT. Yes, sir.

Mr. JAMES. Then, tell me why, on page 18, section 21, it is stated that "this article shall not apply to this contract so far as it may be within the operation or exception of section 116 of the act of Congress approved March 4, 1919?"

Mr. HAMMITT. That is a misprint.

Mr. JAMES. What is the correct year?

Mr. HAMMITT. I do not know what the correct year is, but that was a statute then in existence, and this contract was executed on the date it states. That is a mistake of the printer.

Mr. JAMES. Would you mind putting in the record the correct date, and also the exact language of section 116?

Mr. HAMMITT. The date of the act and the exact language of section 116?

Mr. JAMES. Yes.

Mr. HAMMITT. Yes; I will do that.

Mr. JAMES. I notice it states in Article XXI, on page 18, that "No Member of or Delegate to Congress or Resident Commissioner shall be admitted to any share or part of this contract." What was the occasion for using such language as that? Nobody in Congress was trying to get any share, or trying to butt in, was he?

Mr. HAMMITT. I think that was the usual provision in all contracts, and it was simply a means of making clear what, I suppose, was always the fact, that there was no Member or Delegate in Congress who was interested, and I take it that there is some general provision of law that requires that. At any rate, that never was called to my attention, and we never thought of that provision.

Mr. JAMES. I would like to have the contract of November 16, 1917, in the record.

The CHAIRMAN. If there is no objection that will be inserted in the record. (The contract referred to is as follows:)

ORDNANCE DEPARTMENT CONTRACT, UNITED STATES ARMY.

These articles of agreement entered into this 16th day of November, 1917, by and between Air Nitrates Corporation, a corporation organized and existing under the laws of the State of New York, of the first part (hereinafter called the corporation) and the United States of America, by J. W. Joyes, colonel, Ordnance Department, United States Army (hereinafter called the contracting officer), acting by authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, of the second part. Witnesseth:

Whereas the American Cyanamid Co., a corporation of the State of Maine, is the producer of certain chemicals by the so-called cyanamid process, necessary for the production of ammonium nitrate, and is familiar with and controls exclusive patents and processes for the production of such chemicals in this country. The United States plans to have produced ammonium nitrate upon a large scale, and to have created, constructed, and operated a plant for such production. The said company proposes to assist the United States in its plans (1) by licensing the United States and the Air Nitrates Corporation as agent of the United States to use its patents and processes; (2) by placing at the disposal of the Air Nitrates Corporation all its experiences, records, and plans appertaining to the production of the said chemicals; (3) by placing at the disposal of the Air Nitrates Corporation certain members of its executive and technical force; (4) by placing at the disposal of the Air Nitrates Corporation all its plants for the purpose of training superintendents, foremen, and chief operatives. And the United States proposes to compensate the American Cyanamid Co. for so licensing such patents and processes all as set forth in a contract marked "1" bearing even date herewith and annexed hereto. The said company is unwilling to subject its property and assets to liability in connection with the creation, construction, and operation of the plant. Accordingly the said company has organized the Air Nitrates Corporation (the corporation under this agreement) which shall act as the agent of and which shall be solely responsible to the Government in the creation, construction, and operation of the proposed plant and according to the terms hereof, and

Whereas war exists between the United States and Germany, constituting a national emergency,

Now, therefore, under the provisions of section 120 of an act of Congress relating to national defense, approved June 3, 1916, and pursuant to all other laws of the United States and Executive orders of the President of the United States or heads of its departments, under which the requirements of advertising for proposals are dispensed with, and contracts in the form hereof duly authorized.

This contract witnesseth that in consideration of the mutual agreements herein contained, the said parties have agreed, and by these presents do agree, to and with each other as follows, viz:

ARTICLE 1. The corporation will engage exclusively in the creation, construction, and operation of the plant herein described.

ART. 2. The corporation acting as agent for and at the cost of the United States, agrees to plan, create, lay out, construct, erect, and install or cause to be planned, created, laid out, constructed, erected, and installed at Muscle Shoals, Ala., upon land of the United States, to be purchased by the corporation for the United States, all temporary buildings, houses, warehouses, hospitals, stores, commissaries, structures, plant machinery, railway tracks, roundhouses, roads, ways and sewerage, water and lighting systems, and do all grading and purchase locomotives, cars, fixtures, tools, equipment, apparatus, and appurtenances, and shall purchase for the United States and open up, equip, and operate such quarry or quarries as shall be reasonably necessary for the undertaking provided for by this agreement, and shall build or cause to be built and equipped a local power plant for the purpose of furnishing part or all of the requisite power, all hereinafter collectively referred to as the "plant," necessary for the production of approximately 110,000 short tons of ammonium nitrate per annum by the use of the so-called cyanamid process, in accordance with a general plan hereto annexed and made a part hereof, and such changes as may be made from time to time in said plan, such changes to be made with the approval or ratification of the contracting officer. The entire construction of the plant shall be at the cost of the United States, but the corporation shall make no charge to the United States for the items specifically set forth in paragraphs 1, 2, 3, and 4 in article 4 hereof. The United States may make arrangements with others than the corporation for the furnishing, from an outside source, of a portion of the electric power necessary to operate the plant.

ART. 3. The corporation acting as agent for and at the cost of the United States agrees to operate the said plant up to June 1, 1921, or thereafter for as long as the United States shall remain in the present war, and to use its best efforts to begin said operation at the earliest practicable date and whenever the plant is sufficiently advanced to obtain production to begin said operation. The operation of the plant shall be at the cost of the United States, but the corporation shall make no charge to the United States for the items specifically set forth in paragraphs 1, 2, 3, and 4 in article 4 hereof.

ART. 4. The United States will bear the entire cost of the construction and operation of the plant and conducting the business and activities of the corporation, and will supply the corporation with all money necessary therefor in such amounts and in such manner as to allow all of its activities with respect to the construction and operation of the plant to proceed without delays or interruptions and without the necessity of the corporation providing any capital or borrowing any moneys.

The corporation will make no charge to the United States for the following things:

1. For procuring from the American Cyanamid Co. a license to it as agent of the United States to use the said company's patents and processes.

2. For procuring from the American Cyanamid Co. the disposal, for the purposes of the Air Nitrates Corporation, of the said company's experiences, records, and plans appertaining to the production of the said chemicals hereinabove referred to.

3. For procuring from the American Cyanamid Co. the disposal, for the purposes of the Air Nitrates Corporation, of the following members of the said company's executive and technical force, namely, the president, vice president and general manager, superintendent of manufacture, sales and traffic manager, chief technologist, chief engineer, assistant engineer, and in addition thereto, in connection with the operation of the plant, two principal works managers as such offices may from time to time be filled.

4. For procuring from the American Cyanamid Co. the disposal, for the purposes of the Air Nitrates Corporation, of all of the said company's plants for the purpose of training superintendents, foremen, and chief operatives.

ART. 5. Time being the essence of this agreement, the corporation will (1) organize as soon as practicable such departments as shall be necessary or desirable, including engineering, administrative, purchasing, manufacturing, accounting, and legal departments; (2) procure options upon and purchase for the United States and with moneys supplied by the United States such land as may be necessary or proper for construction, operation, and safeguarding the plant and public and such quarry or quarries as may be necessary or proper for the operation of the plant; (3) engage labor and purchase material, supplies, and the like; (4) use the services of the president, vice president and general manager, engineer assistant to the general manager, superintendent of manufacture, sales and traffic manager, chief technologist, chief engineer,

assistant engineer, and in addition thereto, in connection with the operation of the plant, two principal works managers, all of said American Cyanamid Co., as such offices may from time to time be filled; (5) secure the experiences, records, studies, designs, and plans bearing in any way upon the processes necessary for the manufacture of ammonium nitrate which the American Cyanamid Co. now has or which hereafter may be acquired during the term of said contract marked "1"; (6) establish and maintain a main office in the city of New York, N. Y., branch and field offices, and employ advisory, administrative, executive, clerical, and other labor, including managers, superintendents, engineers, chemists, draftsmen, mechanics, and clerical force and laborers; (7) procure machinery, tools, appliances, fixtures, and materials of all sorts; (8) construct and maintain adequate but temporary houses of different and suitable grades for employees and for persons employed by the corporation whose services are reasonably necessary in carrying on its activities under this agreement, for the reasons that there are no housing facilities available at Muscle Shoals, and provide all that may be necessary or desirable by way of sanitation or otherwise for the general welfare of such employees, including infirmaries, hospitals, commissaries, and stores; (9) construct railway tracks, roads, streets, ways, and sewerage, water and lighting systems, and procure locomotives and cars; (10) procure construction equipment, including pumps, derricks, concrete mixers, hoists, shovels, cranes, and the like; (11) enter into contracts for the construction of the plant or for any portions thereof, or for anything in connection therewith.

ART. 6. The corporation in dealing with parties other than the United States shall make all contracts, purchases, and other arrangements for performing this contract in its own name and for its account, and shall not bind or purport to bind the United States, unless the contracting officer shall in writing approve. The corporation shall, unless directed by the contracting officer, insert in every contract made for the construction or operation of the plant, a provision that such contract may be assigned by the corporation, with the consent of the contracting officer, and that such contract relates to the main contract between the corporation and the United States.

All property, including land, paid for or partly paid for by the United States, shall, upon completion of payment, become the property of the United States. The United States may at its option from time to time furnish the corporation with any property for the construction and operation of the plant; provided, however, that the corporation's undertakings for the same made in good faith are not thereby interfered with.

The corporation in operating, caring for, and storing property shall use all reasonable efforts to adequately protect the same, and otherwise shall not be liable for any loss or damage thereto, and the corporation shall be obligated to procure and thereafter maintain only such fire, liability, indemnity, or other insurance in such forms, in such amounts, and for such periods of time as the contracting officer or inspector may approve or require.

The corporation and contractors shall make no departure from the standard rate of wages paid to workmen in the locality where the said work of construction and operation is being done without the prior consent or approval of the contracting officer or the inspector.

ART. 7. The United States shall not be obligated to make any expenditures relating to the performance of this contract unless the approval or ratification of the contracting officer shall have been obtained.

The corporation in the construction and operation of the plant shall abide by such directions of the contracting officer as he shall give the corporation from time to time, and such construction and operation shall be in all respects subject to the approval or ratification of the contracting officer. The corporation, its officers and agents duly appointed by the corporation for the purpose of obtaining such approval or ratification as the case may be, shall from time to time consult with the contracting officer upon the general character of work contemplated or previously done, or previously or about to be contracted for.

The processes and work involved in the manufacture of the final product of ammonium nitrate shall be conducted so that said final product may be in accordance with the Ordnance Department's specifications for such material.

Pay rolls for labor and services performed, invoices for material, invoices for rental, contracts for construction of plant, and payments thereunder shall be furnished to the contracting officer or inspector for approval or ratification. Upon such approval or ratification the contracting officer shall either furnish

funds to the amounts of all of said charges approved or ratified, which shall be immediately paid out by the corporation under the supervision of the contracting officer or his representatives, or may be paid direct by the contracting officer or his representatives to the persons entitled thereto. The United States may make payments for property delivered or services performed under any contracts or subcontracts direct to the contractors or subcontractors.

The contracting officer will from time to time instruct the corporation as to (1) the methods to be followed in reporting cost; (2) the submission of statements thereof, bills therefor, and all other supporting papers; (3) the submission of engineers' and accountants' certificates; and (4) such additions, if any there be, to the allowance of costs and such regulations and instructions with regard to its determination as from time to time shall be adopted by the Chief of Ordnance, or as may be required in order to enable the contracting officer to issue his proper certificate for payment thereof.

Instructions for all purposes under this agreement whenever practicable shall be in writing addressed to the corporation.

ART. 8. As full compensation for the services of the corporation the United States shall make payment to the corporation of the following fees:

(1) Fee No. 1, equivalent to $3\frac{1}{4}$ per cent of the entire cost of the creation and construction of the plant. Payments of such fee shall be made monthly upon the proper certificate of the contracting officer for that portion of the entire cost approved or ratified during the month or months preceding and for which the fee is then unpaid. The total of this fee shall not exceed \$1,000,000.

(2) Fee No. 2 is equivalent to one-quarter of 1 cent per pound of ammonium nitrate produced at the plant in accordance with the Ordnance Department's specifications for such material, or accepted by the inspector, from commencement of operation to June 1, 1921, and thereafter for so long as the United States shall remain in the present war. Payment shall be made monthly upon the proper certificate of the contracting officer or inspector showing delivery and acceptance of ammonium nitrate.

ART. 9. Cost upon which fee No. 1 of the corporation is based shall be the entire cost from the 16th day of November, 1917, of creating and constructing the plant approved or ratified by the contracting officer, including, among other items, the following:

(a) All the land, including quarry or quarries, labor, material, machinery, fixtures, equipment, apparatus, appurtenances, tools not owned by the workmen, supplies and equipment necessary for either temporary or permanent use for the construction and operation of the plant, including the opening up and operation of quarry or quarries.

(b) Rental for construction plant and for the main and branch offices, and for furnishing and equipment for such offices.

(c) Loading and unloading construction plant, the transportation thereof, including transportation to and from the place or places where it is to be used in connection with said work, the installation and dismantling thereof, and ordinary repairs and replacements during its use in the said work.

(d) Transportation and expenses, including transportation tax to and from the work of the necessary field and office forces, procuring labor, and expediting the production and transportation of material and equipment. All freight charges on equipment, furnishings, material, and supplies, including transportation tax thereon.

(e) Salaries of managers, engineers, superintendents, timekeepers, foremen and other employees at the main and field offices of the corporation in connection with said work, salaries of the executive officers of the corporation, except such as shall be placed at the disposal of the corporation by the American Cyanamid Co., and set forth in contract marked "I."

(f) Temporary buildings, houses, warehouses, hospitals, infirmaries, stores, commissaries, and structures, and the equipment required therefor, and furnishings and equipment required for main and field offices, and the cost of maintaining and operating the same, and including such minor expenses as telegrams, telephone service, expressage, postage, etc.

(g) Temporary buildings of different grades, warehouses, local power plant, structures, plant machinery, railway tracks, locomotives, cars, roundhouses, roadways, grading and sewerage, water and lighting systems, fixtures mentioned and described in article hereof.

(h) All bonds required by this agreement, and all bonds necessary or proper, fire, liability, and other insurance, and such losses and expenses not compensated by insurance or otherwise as are found and certified by the contracting

officer to have been actually sustained (including settlements made with the written consent and approval of the contracting officer) by the corporation in connection with said work, and to have clearly resulted from causes other than the fault or neglect of the corporation. Such losses and expenses, when incurred by the corporation in connection with damage to third person resulting from the work, shall be included in the cost of the work, but not for the purpose of determining the corporation's fee; but such losses and expenses, when incurred by the corporation in connection with constructing and replacing any of the work destroyed or damaged, shall be included in the cost of the work for all purposes hereunder.

(i) Permit fees, royalties, and other similar items of expense incidental to the execution of this agreement.

(j) Transportation, including all transportation tax, traveling and hotel expenses, and telephone, telegraph, mail, and express, expenses of officers, engineers, and other employees of the corporation as are actually incurred in connection with this work.

(k) Amounts paid to contractors or subcontractors under contracts approved or ratified by the contracting officer, and sums paid by the United States upon contracts made with any person at the request of the corporation.

(l) All manner of expense of the corporation in creating and constructing the plant and its equipment, including administration, superintendence, engineering, materials, labor, freight, transportation tax, power, heat, light, rentals, insurance, liabilities, losses not covered by insurance, and all overhead, general, and legal costs and expense, and including all other items of expenditure made by the corporation not properly chargeable to manufacturing.

(m) In addition thereto further allowances, if any there be, of cost from time to time may be made by the contracting officer.

The enumeration of the foregoing items shall not be deemed to be inclusive of all items of cost and shall not be construed to exclude in determining cost and the fee thereon other items of expenditures entering into the cost of creation and construction of the plant and not herein enumerated.

All revenue, if any, from the operation of any housing, boarding houses, commissary, stores, infirmary, hospital, or other facilities, or from rebates, refunds, etc., shall be accounted for by the corporation to the United States.

The United States may itself furnish construction plant, materials, machinery, equipment, or other property for use upon the job; the cost of all such property shall be included in the cost upon which the corporation's fee shall be based.

ART. 10. The contracting officer will detail an inspector to work with the corporation at its main office in New York and an inspector to work with the corporation at its branch office at the site of the plant, which inspectors shall have authority to give approvals, ratifications, and instructions to the corporation hereunder and to receive and transmit to the disbursing officer vouchers prepared by the corporation.

At the request of the corporation the United States may enter into contracts with any person or corporation to perform any of the work in connection with the construction of the plant or for supplying materials, machinery, or equipment therefor, but the sums paid thereon shall be deemed to be a part of the cost of the plant in determining the corporation's fee No. 1.

In the event that the corporation shall deem it for the best interest of the United States in carrying out this agreement, the contracting officer may upon request purchase and pay for direct any work in connection with the construction of the plant and materials, supplies, machinery, and equipment, but the corporation shall prepare such advertisements, specifications, abstracts of proposals, and vouchers for such purchases upon the prescribed Government blanks and present the same to the contracting officer for approval and acceptance, and the contracting officer shall pay the sums set out in such proposals as approved and accepted to the persons making the same. The sums so paid shall be included in the cost of the plant in determining the corporation's fee No. 1.

The contracting officer shall detail a disbursing officer for service at the main office and one for service at the branch office at the site of the plant, with power and sufficient funds to discharge the pay rolls as they become due and to make any other payments as they shall become due on account of this agreement.

ART. 11. It is further agreed that if in the judgment of the contracting officer the oxidation of ammonia and its conversion to dilute nitric acid or the manufacture of ammonium nitrate from dilute nitric acid by interation with ammonia may be done more advantageously by improvised methods of persons or companies other than the corporation, the contracting officer shall be free to call

upon the corporation to install and use such methods or processes in its operation of the plant at the cost and expense of the United States. The contracting officer shall be free to consult with persons other than the corporation upon all matters relating to the operation of the plant, to the end that the best results of operation may be obtained.

ART. 12. The contracting officer or his representative shall be afforded at all times proper facilities for inspection of the work and shall at all times have access to the premises, to the work and material, and to all books, records, correspondence, instructions, plans, drawings, receipts, vouchers, and memoranda of every description of the corporation pertaining to said work; and the corporation shall preserve for a period of six years after its completion or cessation of work under this contract all of the books, records, and other papers just mentioned. The corporation or its duly authorized representative shall be accorded the privilege of examining the books and papers of the contracting officer relating to the work performed or materials furnished under this contract for the purpose of checking up and verifying the cost of this work.

ART. 13. In the event that in the opinion of the Chief of Ordnance the public interests so require, this contract may be terminated by notice in writing to the corporation without prejudice to any claim the United States may have against the corporation or the corporation may have against the United States. In the event of the termination of this contract as aforesaid the United States shall pay to the corporation all costs and obligations of the corporation arising in connection with the construction or operation of the plant therefor properly incurred, but not previously paid. In addition thereto the United States shall make the following payments under the following conditions:

(1) In the event that this contract is terminated during the construction of the plant, if the corporation is not in default in any substantial agreement herein contained, the United States shall pay the corporation such percentage of the fee No. 1 provided for in article 8 hereof, and not theretofore paid, as may be found by the Chief of Ordnance as fairly and justly amounting to the percentage of the work then performed, including obligations incurred which the contracting officer may approve or ratify, and for which payment has been or will be made.

(2) In the event that the contract is terminated during or prior to the operation of the plant by the corporation, then the corporation shall be paid the sum of money if any then due on account of the production of ammonium nitrate, and the United States shall thereafter continue to pay to the corporation one-quarter of 1 cent per pound for the ammonium nitrate produced therein for the period provided in paragraph 2 of article 8 hereof.

Provided, however, and it is understood and agreed, that this contract shall not be canceled prior to June 1, 1921, or so long as the United States shall remain in the present war, except for the permanent cessation of all activities of the United States in connection with the plant, unless the corporation exhibits such default or negligence as to require that the United States in its best interests should directly construct and operate the plant.

ART. 14. It is understood and agreed that if upon cessation of this war or for any other reason under this agreement the United States determines to cease the construction or operation of the plant and proposes to dispose of the same, the corporation shall be given the first opportunity to purchase the plant and its contiguous property, and that no other propositions for the purchase thereof shall be considered by the United States until the corporation has had a reasonable period of time in which to negotiate a purchase.

ART. 15. This contract shall not, nor shall any right to receive payment or any other interest therein, be transferred or assigned by the corporation to any persons, firms, or companies without the consent of the Secretary of War.

ART. 16. In the event that labor disputes shall arise directly affecting the performance of this contract, and causing, or likely to cause, delay, the corporation may address a written statement thereof to the Chief of Ordnance for transmission to the Secretary of War with the request that such dispute be settled, providing such information shall be within the control of the corporation, as the Secretary of War shall require, and it is stipulated and agreed that the Secretary of War may thereupon settle or cause to be settled such dispute.

ART. 17. This contract, and all subcontracts made in pursuance hereof, is subject to the provisions of the following laws:

1. The naval appropriation act approved March 4, 1917, containing, among other things, the provision quoted below in the President's Executive order dated March 24, 1917.

2. The President's Executive order dated March 24, 1917, which provides as follows:

"Under authority contained in the naval appropriation act approved March 4, 1917 (Public, 64th Cong.), whereby it is provided—

"That in case of national emergency the President is authorized to suspend provisions of law prohibiting more than eight hours of labor in any one day of persons engaged upon work covered by contracts with the United States.

"Provided further, That the wages of persons employed upon such contracts shall be computed upon a basic day rate of eight hours' work, with overtime rates to be paid for at not less than time and one-half for all hours' work in excess of eight hours.

"It is hereby ordered that the provisions of the act approved June 19, 1912, limiting the hours of daily service of mechanics and laborers on work under contracts to which the United States is a party are suspended with respect to all contracts for ordnance and ordnance stores and other military supplies and material, contracts for buildings under construction or to be constructed at the arsenals, and contracts for fortifications work during the pending emergency and until further orders.

"This order shall take effect from and after this date.

"WOODROW WILSON.

"The White House, March 24, 1917."

The act of June 19, 1912, referred to in the aforesaid Executive order contains, among other things, the following provisions:

"Sec. 1. That every contract hereafter made to which the United States * * * is a party, and every such contract made for or on behalf of the United States * * * which may require or involve the employment of laborers or mechanics, shall contain a provision that no laborers or mechanics doing any part of the work contemplated by the subcontractor for any part of said work contemplated shall be required or permitted to work more than eight hours in any one calendar day upon such work; and every such contract shall stipulate a penalty for each violation of such provision in such contract of \$5 for each laborer or mechanic for every calendar day in which he shall be required or permitted to labor more than eight hours upon said work * * *."

ART. 18. No Member of or Delegate to Congress, or Resident Commissioner, is or shall be admitted to any share or part of this contract or to any benefit that may arise therefrom; but this article shall not apply to this contract as far as it may be within the operation or exception of section 116 of the act of Congress approved March 4, 1909 (55 Stats., 1109).

ART. 19. No person or persons shall be employed in the performance of this contract who are undergoing sentences of imprisonment at hard labor which have been imposed by the courts of the several States, Territories, or municipalities having criminal jurisdiction.

ART. 20. Except as this contract shall otherwise provide, any doubts or disputes which may arise as to the meaning of anything in this contract shall be referred to the Chief of Ordnance for determination. If, however, the corporation shall feel aggrieved at any decision of the Chief of Ordnance upon such reference, he shall have the right to submit the same to the Secretary of War.

ART. 21. Notice under this contract shall be deemed to have been sufficiently given to and received by the corporation when mailed in a sealed, postpaid wrapper addressed to Air Nitrates Corporation, at 511 Fifth Avenue, New York, N. Y.

ART. 22. The corporation shall furnish to the United States at cost to the United States, within 10 days after execution and delivery of this agreement, a performance bond in the sum of \$250,000, conditioned upon the full and faithful performance of that portion of this contract providing for the construction of the plant by the contractor. Such bond shall be in the form and with sureties satisfactory to the contracting officer.

ART. 23. If necessitated by lack of existing appropriations of public funds applicable to that part of this agreement with respect to the operation of the plant, the United States shall have the right to make and execute, and the corporation shall thereupon execute, a new contract under the same terms and conditions as these presents.

ART. 24. This contract may be executed in any number of counterparts, all of which together shall constitute one original contract. Whenever the term "contracting officer" is used in this contract the same shall be construed to mean the contracting officer executing this agreement, his successor or successors, his

duly authorized agent or agents, or anyone designated by the Chief of Ordnance from time to time to act as contracting officer hereunder.

In witness whereof the party of the first part has caused this contract to be executed by its proper officers thereunto duly authorized, and the United States of America has caused this contract to be executed by the undersigned contracting officer thereunto duly authorized.

AIR NITRATES CORPORATION.

By FRANK S. WASHBURN,

President.

C. M. GRANT,

Secretary.

J. W. JOYES,

Colonel, Ordnance Department, United States Army, Contracting Officer.

Witness:

CLARKE M. ROSECRANTZ.

Attest:

ALFRED H. WHITE.

Mr. PARKER. You say you sold fertilizer material to the Virginia-Carolina Chemical Co. and possibly to other companies. What fertilizer materials did you sell?

Mr. HAMMITT. We sell cyanamid to the Virginia-Carolina Chemical Co.

Mr. PARKER. Do you sell phosphates, too?

Mr. HAMMITT. I am not sure whether they have bought phosphate rock.

Mr. PARKER. I do not mean to them, but to other people.

Mr. HAMMITT. Oh, yes; we sell phosphate rock.

Mr. PARKER. Do you sell phosphates?

Mr. HAMMITT. No, sir.

Mr. PARKER. Do they use the cyanamid as a fertilizer material?

Mr. HAMMITT. Yes, sir.

Mr. PARKER. Right in the fertilizer, as it is?

Mr. HAMMITT. Yes; right in the fertilizer.

Mr. PARKER. What quantity of your product do you sell, and at what price?

Mr. HAMMITT. We have sold, in the largest year, to the American fertilizer industries as much as 40,000 tons, and in 40,000 tons of cyanamid there would be—

Mr. PARKER (Interposing). What percentage?

Mr. HAMMITT. You mean the percentage of our total business?

Mr. PARKER. What percentage of cyanamid is nitrogen?

Mr. HAMMITT. There is 25 per cent ammonia; that is the unit we use. That would be 10,000 tons of ammonia. The present price of that form of ammonia is approximately \$2.10 per unit, and a unit is 20 pounds, which would mean about 10 cents a pound.

Mr. PARKER. Do you sell carbide?

Mr. HAMMITT. No, sir; we use all the carbide we make for making cyanamid from it.

Mr. PARKER. Do you sell any other product from your factory except cyanamid?

Mr. HAMMITT. Yes; we sell cyanide, and we sell hydrocyanic acid gas.

Mr. PARKER. You have got the phosphates already. Take the cyanide and the hydrocyanic acid gas, could those be made at this nitrate plant?

Mr. HAMMITT. You can make your cyanide from the crude cyanamid—it would be necessary to put up another plant for that purpose.

Mr. PARKER. Cyanide of what?

Mr. HAMMITT. I think our cyanide would probably be called calcium cyanide; for that is a mixture.

Mr. PARKER. Does the hydrocyanic acid gas need another process?

Mr. HAMMITT. That is manufactured from the cyanide. That requires another separate plant. Our entire plant in California is devoted to making hydrocyanic acid gas from cyanide.

Mr. PARKER. Are they complicated plants?

Mr. HAMMITT. Yes; they are both complicated. We make various other forms of ammoniates.

Mr. PARKER. Your principal sale is in cyanamid, is it, or do you sell more ammonia?

Mr. HAMMITT. In normal times our best business is in cyanamid. At the present time our best business in money value is cyanide, but that is because the fertilizer industry is down.

The CHAIRMAN. We are very much obliged to you.

Mr. HAMMITT. I am very much obliged to the committee for a day and a half of courtesy.

The CHAIRMAN. I want to thank you for your kindness in your answers to the questions asked by members of the committee.

(Thereupon the committee took a recess until 2.30 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

STATEMENT OF MR. CHARLES H. MACDOWELL.

The CHAIRMAN. Mr. MacDowell, will you kindly state your name in full, the positions you occupied for the Government during the war, and your present position.

Mr. MACDOWELL. Charles H. MacDowell; during the war, director of the chemicals division of the War Industries Board, handling all materials of that general character which entered into the chemical and explosive program; president of the National Fertilizer Association; president of the Armour Fertilizer Works, Chicago; president of the Western Society of Engineers; and member of the Federated Engineering Council of Washington.

The CHAIRMAN. Mr. MacDowell, I understand that you are very familiar with the subject of fertilizers, especially. Do you know the Muscle Shoals plant?

Mr. MACDOWELL. I know something of it, as I was reasonably familiar with the starting of it and the need for the product.

The CHAIRMAN. Will you kindly state to the committee in your own way what you know about the early life of the Muscle Shoals work.

Mr. MACDOWELL. My own particular specialty in the War Industries Board, aside from directing the general activities which were carried on through some 20 department heads, was the personal handling of the nitrate of soda problems.

We were entirely dependent on Chile for that particular form of ammonia or of nitrogen, I should say, which had the most to do with the development and carrying out of the war program as far as explosives, propelling powders, and many other war needs were concerned. Chile has normally a capacity to manufacture about 3,000,000 tons of nitrate of soda annually. It has a normal stock on hand in plants and at coast of about 600,000 tons.

Prior to our getting into the war Europe had been calling for large quantities of nitrates for the manufacture of their war needs. When I say Europe I mean the allied countries.

Nitrates, which ordinarily had a value of around 7 to 8 shillings a Spanish 100 pounds, had gone up perhaps to 10 or 11 shillings when we entered the war. As we had the long pocketbook some Chileans thought there was a good opportunity to get more, and the price was rapidly advanced to as high as 16 shillings.

In studying how we should handle the matter and get a price within the general pocketbook the plan was developed that it should be handled through an international nitrates committee, and that practically eliminating the details of the machinery there would be one directing power and one real buyer to handle all of the nitrates which we might need.

The situation was a difficult one. The Germans for a time had a fleet on that side of the Pacific. We were short of tonnage and we had many problems to solve. We did solve them. We were scared a good many times, but we wiggled through. We traded nitrates around from plant to plant and took them from fertilizer people, borrowed them, and took them in other ways, and we kept every war activity fully supplied with nitrates during that critical period.

However, the Government felt that it was necessary to have other supplies beyond those that naturally existed in this country. We were getting a pretty fair tonnage of ammonia from the by-product coke and gas oven people, but it was thought in the best interest that we should prepare and build as rapidly as possible certain plants for the fixation of nitrogen for whatever purpose we might make use of it.

Two plants were started at or near Muscle Shoals. One of them was based on some experimental work which had been done by a company here in attempt-

ing to solve what is known as the Haber method of uniting the two gases which Germany had developed prior to the war and which was serving her purposes wonderfully.

The other method which was adopted was one which was carried on successfully in Europe and in this country known as the cyanamid process for fixing nitrogen. That particular plant was located at Muscle Shoals and was planned to have a capacity of 110,000 tons or thereabouts of ammonium nitrate, one of the high explosives.

There are several ways, I might say, of making ammonium nitrate. One of them is a method of taking the weak nitric acids made in making dynamite and other nitrating things and passing ammonia gas through it, and then crystallizing out the product. That is the ordinary peace-time method of making it for what are known as permissible explosives.

The second plan, and the one which was used most largely in the allied countries, as they had no nitrogen fixation plants, was to take sulphate of ammonia and nitrate of soda and mix them together in solution, and there was a swap there of the ingredients, and out of it came ammonium nitrate.

Our Government built a plant at Perryville, Md., which, if I remember correctly, had a capacity of about 300 tons a day of that material.

During 1918 we imported from Chile 1,800,000 tons, odd, of nitrate of soda. We would have gone beyond 2,000,000 tons had the war continued. Our military plans for 1919 required that we bring in two million and some odd thousand tons of nitrate for the war program alone, plus all of the production of Muscle Shoals and plus the ammonia which was recovered by the by-product plants. So it was a very big and a very difficult problem.

In addition to that, we use in this country in making sulphuric acid, which is also a component of the explosives, something like 90,000 tons of nitrate of soda. We normally use about 160,000 tons in making blasting powders and explosives of that particular type. In addition, normally, the fertilizer industry used about 300,000 tons of nitrate of soda through the regular channels of the industry, and the farmers were buying as much as about 100,000 tons, so that our use of that particular commodity was approximately, in the fertilizer industry and in the farm needs for it as such, about 400,000 tons.

The CHAIRMAN. At about this time you are speaking of, Germany had been swept off the seas and there was no danger in bringing the nitrates from Chile to this country.

Mr. MACDOWELL. Yes; that danger was eliminated. The greatest trouble we had was in getting bottoms to bring it in. During the winter of 1917-18, if you will recall, we had a very severe winter and we had to take boats and transport coal and other things with them, and, further, we were needing our transportation for shipments to Europe.

We were at one time within four weeks of exhausting our nitrate supply, but we sat down very hard on the Shipping Board and a change took place and we got, as I recall, as high as 390,000 tons of nitrates out of Chile in one month. So we got that fixed up and we got along pretty well.

We had to divert nitrates to France on account of losses there which got in the way of our distribution here, and we had a good many dramatic problems to solve, but we did get by and without one day's loss so far as nitrate of soda was concerned. That is about all I know of Muscle Shoals; just the general need for the development of nitrogen fixation capacity here to supplement what we could get from other sources.

The CHAIRMAN. The act of 1916, the national defense act, had a provision, as you know, section 124, for the fixation of nitrogen at a plant to be constructed in the United States.

Mr. MACDOWELL. Yes, sir.

The CHAIRMAN. Do you know whether the object to be attained by that enactment was intended to protect this country in case we lost control of the seas and had to depend on ourselves for this nitrate?

Mr. MACDOWELL. Unquestionably.

The CHAIRMAN. That was the purpose very largely, you think?

Mr. MACDOWELL. Yes; to as near as possible provide ourselves at home with this very essential chemical for both military and agricultural purposes.

The CHAIRMAN. That is the way Germany supplied herself during the war?

Mr. MACDOWELL. Yes.

The CHAIRMAN. Germany having been cut off from the Chilean supply by hostile fleets.

Mr. MACDOWELL. Yes. One of the main foundations, undoubtedly, of Germany's entry into the war at the time was the fact that she was fortified by what she thought at that time was a large production or ability to produce some of her essential explosives.

The CHAIRMAN. In the use of the nitrates made at Muscle Shoals, was the matter of the fertilizer or the use in fertilizing of the commodity to be produced at that point taken into consideration?

Mr. MACDOWELL. In the general public discussion of nitrogen fixation which was started, if you will recall, in 1916, the fact that cannon and plants ate the same food was emphasized, and the thought was put out that if we should develop our ability to produce this necessary chemical in this country we would have both a war-time and a peace-time need for the product.

The CHAIRMAN. But, as I recall now, the use of the product for explosives was considered of vital importance at that time.

Mr. MACDOWELL. That was the national defense feature of it, and was, of course, the largest influence or the greatest influence in reaching that general decision.

The CHAIRMAN. Regarding fertilizer, this product of the nitrate plants is not in itself a fertilizer, is it?

Mr. MACDOWELL. It can be used in itself as a fertilizer to supply the nitrogen feature of agriculture; yes.

The CHAIRMAN. Is it not one of the component parts of the fertilizer?

Mr. MACDOWELL. As we understand the fertilizer business, it is one of the several essential chemicals or plant foods that go to make the finished fertilizer which is most largely used by the farmers of the country.

The CHAIRMAN. You are familiar with the plant at Muscle Shoals?

Mr. MACDOWELL. Reasonably so. I have not seen it but I am reasonably familiar with it; yes.

The CHAIRMAN. Do you believe that the Government could sell outright the nitrate plant No. 2 to a man like Ford, selling it at a comparatively small amount of what it cost and help the farmers of this country by using the products of that nitrate plant for making fertilizer?

Mr. MACDOWELL. In answer to that I will say that until the farmer uses materially greater quantities of nitrogen in the forms which would be made down there, there is no need for that product for agriculture in this country. As the farmer uses more nitrogen, if the normal sources of supply do not increase in proportion to his increased demand, there will come a time when that product will be needed, but at the moment, no; and as far as I can foresee for some years, no. I am speaking now from the production and from the demand standpoint.

The CHAIRMAN. Then do you believe that the conditions are such in this country that a man like Henry Ford would be justified in asking a 100-year lease or the sale of that property on conditions that in the 100 years subsequent to the signing of the agreement, he would require probably 15 or 20 years, before he could begin to sell that nitrate for fertilizer?

Mr. MACDOWELL. I could not say how long it would take, but it is a number of years ahead before there would be a demand for it; that is, the nitrogen part of it.

The CHAIRMAN. So that Mr. Ford, being looked upon as a shrewd business man, probably, would be justified in asking for a long lease or the sale of that nitrate plant, and then a long lease of the leased portion of Muscle Shoals?

Mr. MACDOWELL. He naturally would want to get as long a lease as he could, but from the standpoint of the production of nitrogen at that plant, under the cyanamid process, I am of the opinion that within five years that process will be obsolete and that therefore that particular plant will not at that time be nearly as efficient in the production of nitrogen, if we get beyond the by-product production, as other methods, one of which is already operating in this country.

The CHAIRMAN. Do you think that the cyanamid process will be obsolete in about five years?

Mr. MACDOWELL. I think so, as far as the production of nitrogen is concerned for fertilizer purposes. It has other uses, of course.

The CHAIRMAN. Of course, the manufacture of these various products has been rather limited in point of time.

Mr. MACDOWELL. Oh, yes.

The CHAIRMAN. How long, if you know, has the cyanamid process been used by the world?

Mr. MACDOWELL. I am not accurate in my memory, but I would say about 15 years.

The CHAIRMAN. And we got into the World War, or at least, the World War broke out in 1914, eight years ago?

Mr. MACDOWELL. Yes.

The CHAIRMAN. Germany at that time was producing cyanamid.

Mr. MACDOWELL. Yes; in a limited way.

The CHAIRMAN. So that she was probably ahead of the rest of the world. We had some discussion of it in Congress along in 1912 or 1913.

Mr. MACDOWELL. Yes.

The CHAIRMAN. But we did practically nothing about it. I think there was a plant installed at Niagara Falls.

Mr. MACDOWELL. Yes.

The CHAIRMAN. But the amount of production was not very great.

Mr. MACDOWELL. That was experimental and following certain other methods than the one used by the cyanamid company.

The CHAIRMAN. Now, you believe that progress has been made with regard to the products of the nitrate plants that enables the world, or will enable the world in a comparatively short time, to set aside those products and employ an entirely new method with regard to the making of the material that goes into the fertilizer.

Mr. MACDOWELL. I will say this: I think from all I know and have read that the Haber method and the Claude method, which is a French development, will enable nitrogen compounds to be produced much more efficiently than under the main-strength method, as you might say, which is used for making it by the cyanamid process. I think that is the general feeling of the scientists of the world, that the greatest progress is coming in that direction, and it is for that reason I say that I think inside of possibly five years this method will probably be called obsolete, because it takes at Muscle Shoals 100,000 horsepower continuously to make 110,000 tons of ammonium nitrate, whereas under the Haber process 20,000 horsepower would be used; and, as I understand it, under the Claude process 10,000 horsepower would be used, and it does not seem to me that it is the economical and sound thing to use 90,000 additional horsepower in any locality, when power can be so well used for other purposes, to make a product which can be made by the expenditure of 10,000 horsepower.

The CHAIRMAN. I understand that in the use of the cyanamid process you have got to have a very high horsepower.

Mr. MACDOWELL. Yes. Further, the raw materials are large in tonnage. A great deal of special work has to be done beyond the method used in making the product through the Haber gas plant.

The CHAIRMAN. Do they require so much horsepower for the Haber process?

Mr. MACDOWELL. Only about one-fifth, and with the improved one-tenth of the horsepower which is required for the cyanamid process.

The CHAIRMAN. What do you mean by "the improved"; do you mean the French process?

Mr. MACDOWELL. Yes; the French Claude process, which is not yet out of the woods, but apparently very close to it.

Mr. HULL. Mr. MacDowell, you say you are connected with the National Fertilizer Co.?

Mr. MACDOWELL. The National Fertilizer Association.

Mr. HULL. What is that association?

Mr. MACDOWELL. That is an association comprised of most of the people engaged in the fertilizer industry.

Mr. HULL. What is the purpose of it?

Mr. MACDOWELL. The purpose is for the improvement generally of the fertilizer industry. It maintains a large organization for the dissemination of scientific knowledge to the farmers. It works closely in that connection with the Department of Agriculture here and with the various State experiment stations. It has agronomists and men skilled in the dissemination of information which the various farm experiment station people get out, and it publishes their results. It also maintains a fellowship or several fellowships at the different agricultural colleges to solve certain problems in connection with the fertilizer industry, such as the best way to distribute fertilizers, the best strengths to be used, and where to place the fertilizer in relation to the roots of the crops, so that the makers of agricultural implements may devise distributing machinery to carry that out. It also maintains a chemical section that is studying the problems which have to do with the business methods of analyses and with problems of that sort. It maintains an insurance section to study and look after the interests of such members as may want to have their insurance

handled through a committee that understands insurance, so that economies may be effected in the carrying out of matters of that sort. It also looks after the general transportation factors and features in the distribution of fertilizers, keeps in touch with the railroad authorities—and did here all during the war—to endeavor to get cars at the different sections where materials are accumulated and at plants where finished fertilizers are shipped, so that the distribution may be made effectively and promptly. It has other interests of that sort.

MR. HULL. Does it in any way have anything to do with the price?

MR. MACDOWELL. It has nothing to do with prices.

MR. HULL. It has no agreements as to the prices?

MR. MACDOWELL. Absolutely none; and has no features slanting at all in that particular direction.

MR. HULL. Are they the authors of what might be called this propaganda that is being sent to Members of Congress in regard to the Muscle Shoals proposition?

MR. MACDOWELL. Over its name.

MR. HULL. Who finances it?

MR. MACDOWELL. The fertilizer association.

MR. HULL. And that includes all the members of the association?

MR. MACDOWELL. Yes.

MR. HULL. And that includes practically all the fertilizer manufacturers?

MR. MACDOWELL. Yes.

MR. HULL. Do they make any nitrates themselves?

MR. MACDOWELL. Practically none in this form. A good many of the members take waste materials, such as leather scraps and hair and old felt hats and occasionally an old silk hat, and old shoes and all materials containing nitrogen, and treat those chemically and make that particular form of nitrogen.

MR. HULL. They also make some nitrogen out of blood?

MR. MACDOWELL. Yes; blood and tankage and materials of that sort. They also take waste sugar molasses from the beet-sugar manufacturers and treat that. They take the garbage tankage and other waste materials which come from the farm and which they think it is sound to send back to the farm to make these various nitrogenous materials. They also buy cottonseed meal, especially during years when there is off meal, and they use at times quite large tonnages of cottonseed meal. They also buy nitrate of soda. They are very large users of sulphate of ammonia. They buy some cyanamid, and they get everything they can which will fit into the fabrication of fertilizers.

MR. HULL. They are purchasers, then, of nitrates?

MR. MACDOWELL. They are purchasers of nitrates, broadly speaking; yes. There is a very small production of ammonium sulphate through the burning of bone for the making of boneblack for sugar refining, but that would only amount to a few tons a year.

MR. HULL. They are opposed to the Government making this Ford contract, are they?

MR. MACDOWELL. They are not in favor of the Government making this Ford contract. They are, however, in favor of the development of the water power at Muscle Shoals.

MR. HULL. Why are they opposed to the Government accepting the Ford proposition?

MR. MACDOWELL. For two reasons: One reason is a public-policy reason, where they think it is questionable public policy to provide facilities and over-facilities at a water power for one man to monopolize for 100 years. They do not think it is wise public policy to give one man the power to say to a community what kind of industry shall be located in that particular section of the country. That is their opposition to it from that standpoint.

Naturally, an industry which is as large as the fertilizer industry, which is as important to the successful getting along of so many sections of the country, is interested in its investments and in its stable future. Further—and this is the main reason I am here—there has been so much said about the need for fertilizers and cheaper fertilizers that I thought it was wise to let you gentlemen know something about the fertilizer situation as it is; whether there be need for additional products before there is need for it; whether the situation, broadly speaking, warrants this investment based on the fact or on the statement that we need to put in the water power to make fertilizer; and, further, I thought I might be informative, personally, to the committee, in connection with this general subject, owing to my rather intimate knowledge of it over a good many years.

Mr. HULL. According to your statement, it would cost at Muscle Shoals \$68 a ton to produce this product, which is now being sold at \$48 a ton.

Mr. MACDOWELL. Yes; around there. I think it is now about \$50 a ton.

Mr. HULL. If that is the case, there would not be any danger at all of Henry Ford upsetting the industry?

Mr. MACDOWELL. Not from the supply standpoint, as the fertilizer industry buys this material. There is always, naturally, a disturbance when large excesses of materials are thrown on the market. To-day the United States has a surplus of sulphate of ammonia recovered through the normal channels. There is always an upsetting when anything anywhere near as large as this proposal is started, very naturally. Whether it be a revolution or an evolution, of course, depends on time; but there always is an upsetting condition which arises from anything of this sort, and naturally the fertilizer people who have very large investments consider those things, and they may very naturally be worried about such matters. That is a natural reaction, and there is no use not being frank about it.

Mr. HULL. Then, really, what you are worried about is that he might produce fertilizer or nitrates down there for a good deal less than \$68?

Mr. MACDOWELL. No; I am not worried about that feature, because there are certain factors which would prevent the cheap manufacture of nitrates at that plant. They may get way below \$58, or whatever the price is, but I want to tell you, gentlemen, if you will permit, how sulphate of ammonia is made to-day, so you may get some idea of the cost side of the products which must compete with the Muscle Shoals production. Coal contains nitrogen, ranging broadly from eight-tenths of 1 per cent up to 1½ per cent of nitrogen. That is a constituent of coal. When it goes to a by-product coke plant or when it goes to the city gas plant and is put into the retorts or ovens to be coked a gas is formed. Those temperatures are too high to recover all of the ammonia in that gas, but it goes along with the gas. It must be taken out of the gas, as it is deleterious to the gas, and it is recovered by the simple expedient of passing it through a shower or a bath of sulphuric acid or dissolving it in ordinary everyday water.

If coal costs \$6 a ton at the coking plant and figuring that there is 500 pounds of ammonia in a ton of sulphate of ammonia, which is a fact, the material cost of the 500 pounds of ammonia, with coal at \$6 a ton, would be \$1.50 for the ammonia which goes into that ton of sulphate of ammonia.

At Muscle Shoals with the cyanamid process, in order to reach that point where the gas maker and the coke maker absorbs it, they have got to go to the quarry and quarry lime. They have got to ship it to Muscle Shoals at a transportation cost. They have got to burn that lime at Muscle Shoals. They have got to get coke either by coking or by buying coke, transporting the coke to Muscle Shoals and grinding it. They have got to mix those two together and put them in an electric furnace and treat that material to make carbide of calcium. They have got to make liquid air. They distill off the nitrogen from the liquid air. They take the carbide and put it in small containers, heat it up again, pass the nitrogen through, and when it is absorbed that product is known as crude cyanamid. They then take that product and put it in big steel pressure tanks and use a caustic solution and make steam and boil it or treat it in order to get the ammonia off of the cyanamid to reach the point where the by-product coke oven gets it with practically no cost.

Beyond that point the costs are practically identically the same as between the Muscle Shoals method and the method which is adopted by the coke people.

Now, in 1914, our production of all kinds of ammonia from gas ovens and by-products ovens was around 200,000 tons. We use a lot of this ammonia for making anhydrous ammonia for refrigeration. That is one of the main elements used in refrigeration. We use it in chemical processes for assembling soda ash and for doing other things. We also use it occasionally at home in the old, familiar household ammonia. They make other chemicals with it. The portion which they do not dispose of in that way they fix in sulphuric acid and dispose of it as sulphate of ammonia, which is a fertilizer product.

In 1913 and 1914 we were importing around 90,000 tons of sulphate of ammonia. During the whole war period our production increased. Instead of wasting these valuable products in the old beehive ovens, we are gradually, and rather rapidly, installing these by-products coke plants, and also installing more coal plants for making gas in the cities.

As a result of this entire war development, hastened and encouraged by the Government advances to people to make more metallurgical coke and domestic

coke during the war, our capacity increased during that period to approximately 550,000 tons equivalent of sulphate of ammonia. It is not all used in that way, only a part of it being used in that way.

In 1919, which was a pretty good fertilizer year, although materials were a little scarce, Dr. Whitney states we exported something like 130,000 tons of sulphate of ammonia. In 1920 I am unable to get the accurate figures. In 1921 we exported 102,000 tons, and we did not send any to Cuba, and Cuba, normally, under sugar, uses about 35,000 to 40,000 tons.

In 1920 we had the biggest fertilizer year on record. As near as we can ascertain, the fertilizer people themselves used about 135,000 tons of sulphate of ammonia. In other words, they are only using about one-half of the total which goes out of the country.

Now, in addition to that, there is some direct form of sulphate of ammonia used by farmers and truckers. I can not give you any figures on that, because I do not know them; but I do know that under normal conditions to-day there is an exportable surplus, if we were running our coke plants to 90 per cent of capacity, of somewhere between 150,000 and 200,000 tons of sulphate of ammonia.

Now, the fertilizer people naturally do not think that the farmers use as much nitrogen as they should. On the other hand, many of the agricultural authorities, and rightly too, are saying that we should go still further in the use of clovers, cowpeas, and those various legumes to get organic matter into our soil before we reach the stage when it would be profitable for them to buy nitrogen in the commercial form; and if you gentlemen will talk with your various experiment-station people you will find that in many sections of the country they so advise.

During the war, there developed in Germany a capacity to produce 2,500,000 tons of sulphate of ammonia. England has a normal exportable surplus of 350,000 tons. Chile has a manufacturing capacity of 3,000,000 tons. The production at Muscle Shoals or the production of more sulphate of ammonia in the coke oven plants will not do away with a our large importations of nitrate of soda from Chile. Nitrate of soda in efficiency as a fertilizer stands at 100 per cent as against 90 per cent for sulphate of ammonia. It is a very quick, predigested form and it is extremely valuable in the trucking sections where they want to get into the markets and capture as much of the high prices for potatoes and other products as they can. It is very desirable in certain sandy soils and certain soils where there is not organic matter. It is largely used in the manufacture of blasting powder and in other ways, and I feel sure in saying to you gentlemen that we will not only continue to use nitrate of soda from Chile, but that we will increase our purchases as the years go on; and after all, it is their dollar to buy our products in this country.

Mr. HULL. These coal-tar products or products of the coke ovens are by-products of the steel industry, are they not?

Mr. MacDOWELL. No; no necessarily. It is a by-product of the industries which provide metallurgical coke for the steel and other people and domestic coke for burning in place of anthracite and for other purposes, and that domestic feature is increasing all the time. Further, we are developing in this country what are known as low-temperature methods of coking coal to make an anthracite substitute. We have one large plant in West Virginia now. I think it is around Fairmont, although I do not recall for sure. In that method of coking you get much larger recoveries of ammonia and other products than you do with the higher temperature methods used by the by-products coke people for metallurgical purposes. You get out of a ton of coal for metallurgical purposes somewhere between 16 and 20 pounds of sulphate of ammonia per ton, which means somewhere around 4 to 5 pounds of the real ammonia per ton of coal coked.

Mr. HULL. In any case it is simply a by-product.

Mr. MacDOWELL. It is a by-product, yes. It is a credit to the cost of making coke.

Mr. HULL. And the price at which you sold it would not affect the production very much.

Mr. MacDOWELL. It would not affect the production at all.

Mr. HULL. It would be produced in any case, depending upon how much you produced the principal article.

Mr. MacDOWELL. Yes; and if it sold for less it would shove up the cost of coke or benzol or tar or creosote or the 55,000 different things that come out of that particular thing.

Mr. HULL. The great body of fertilizer people, or a great many of the fertilizer people, are not producers at all of ammonium sulphate, are they?

Mr. MacDOWELL. Practically none.

Mr. HULL. Then would they not be benefited to some extent if the product was cheapened?

Mr. MacDOWELL. Yes, naturally; but as we already have a big surplus and as we have gotten away with that surplus pretty successfully, because England was not coking coal and Germany was not prepared to compete around the world, even though we have had to come down to \$2 per 100 pounds and even less for the product, yet as those countries come into the market, we are going to have increasing difficulty in disposing of the surplus sulphate of ammonia around the world. The point I am making is that it does not matter to the fertilizer people, providing there are reasonably stable conditions, because their materials have to be bought a long time ahead. It does not matter to them, from a nitrogen-production standpoint, because they are buyers, but that does not do away with the question which comes up: Is it good sense to waste coal and transportation and power which could be better used in other directions to make something which is already, and for some time apparently, is overproduced in this country? That is the attitude of the fertilizer people from that standpoint.

Mr. HULL. Perhaps—I do not quite catch the point—but it seems to me as though the fertilizer people were worrying for fear Henry Ford would break up on this proposition; is that the point?

Mr. MacDOWELL. Will break up?

Mr. HULL. Yes; that he will go broke on this proposition.

Mr. MacDOWELL. Oh, no; we are not worrying about Henry, and he is abundantly able to take care of himself, and if he wants to get into the fertilizer game he can do it. He does not have to have Muscle Shoals to get into the fertilizer game. If he thinks it is something he wants to tackle he can get into it without that, and do it very much better, as a matter of fact. We can not dispute his right to do that.

Mr. HULL. Is it because you are afraid of his making a bad bargain?

Mr. MacDOWELL. I am not afraid of his making a bad bargain and did not appear here from that standpoint at all. I thought that the committee might be interested in having me tell them plainly the ammoniates or nitrogen situation, because you gentlemen are asked to do something based on the proposition that there is need for certain fertilizer materials, and we say that for the time there is no such need.

Now, Mr. Swann was here. I am the Mr. MacDowell that Mr. Swann referred to as having gotten him started in this particular research which he has been doing down at Anniston, Ala.

We wanted some phosphorus during the war and he had a large part of the equipment necessary to make it, and we thought, as we were having difficulty in getting it from Niagara Falls and Canada, that the Government might be able to get facilities for making phosphorus there very much cheaper than anywhere else. At that time he had this equipment, which was not being used, and I asked him if he would not like to experiment to see if he could not make some potash, which we needed in agriculture, and also suggested that he might work further on some phosphate volatilization, which I knew something about, because I had done a little something on it myself. He has done splendid work. He has gotten up to about 80 per cent recovery. The fertilizer industry in the acid method recover about 95 per cent. His statements with regard to concentrated fertilizers and the economy of shipping them, however, do not accord with the development of the art as the scientists and as the farmers understand it to-day.

A good deal of the fertilizer which is used is distributed in grain drills and in close proximity to the grain. We know from practical experience and from tests that you can not go beyond a certain concentration or you injure the germinating power of the seed. We know further from work which Dr. Shriver of the Department of Agriculture, has been doing for some time, and from other sources, that plants require balanced rations, that certain plants require excess ammonia or excess phosphoric acid or excess potash. We are finding out a whole lot about that.

Now, we do not think it is good sense simply because you can ship concentrated stuff to give the plants something which may give them the bellyache so far as phosphoric acid is concerned, because they do not need anywhere near that quantity of material.

Now, the fertilizer industry has adopted this plan or policy, and that is that it is the business of the agricultural experiment stations and the United States Government experiment station to tell them what formulas and what strengths are best adapted for the different soils or for the different kinds of crops to be grown in the different localities. In other words, it is their business to do that, and it is our business to make fertilizers to match as nearly as we can those instructions which they put out.

Now, when we speak of 2-8-2 and 3-0-3, they are pretty fair fertilizers. There are large tonnages of fertilizers put out for trucking and for crops that run 10 per cent ammonia and 8 per cent available phosphoric acid and 5 per cent potash, and some of them run as high as 15 per cent potash. We want to concentrate. We are advising the farmer all the time to use as strong a mixture as he can. That is our belief. It is economy, and the fertilizer industry is vitally interested in getting cheaper fertilizers to the farmer. The farmer is the only man that the fertilizer industry sells. His interest is the fertilizer industry's interest. They must do everything they can to cheapen the cost of getting plant food to the farm. It would be a foolish industry if it did not work in that way. It is experimenting, and it wants the power to use processes or the right to use processes perfecting the art or anything which has to do with decreasing the cost of making fertilizer. If Mr. Swann works out his process or if somebody else works out a process which will cheapen the cost of making fertilizer, the industry or some component part of the industry wants the right, if he will give it under a royalty, to use those things.

It would not feel happy, I will admit, if Mr. Ford had secondary power which cost him \$5.20 per horsepower per year, as Mr. Cooper suggested the other day, and not be able to get somewhere near the same line of cost in order to supply a certain part of the territory or certain sections of the country. In other words, the fertilizer industry feels that the Government, if it puts in that power plant, should make it available, as far as cost is concerned, to different people who may want to go down in that locality and perform any function which is beneficial to the country.

I am speaking very frankly, gentlemen, because I want you to know how those I have talked with feel about it in regard to the industry.

Mr. HULL. Of course we want to get all the information we can, and while perhaps some of these questions may seem a little personal, yet it is because we want to get the different angles to this matter.

Mr. MacDOWELL. Yes; that is right.

Mr. HULL. Now, the amount of fertilizer that a farmer uses depends upon the soil he has, largely, does it not?

Mr. MacDOWELL. No; not necessarily. It depends primarily upon the crop he is growing, plus the condition of his soil. For cereals, for instance, you do not begin to use the tonnage of fertilizer you would under cotton, or more particularly under the various truck crops which are grown in sandy soils.

Mr. HULL. There are certain soils that require practically no fertilizer, although I do not say there is any soil but what would be improved by the use of it.

Mr. MacDOWELL. Oh, yes.

Mr. HULL. Out in Iowa, for instance, we have used very little fertilizer.

Mr. MacDOWELL. Yes; but you are doing some good work at your experiment station there.

Mr. HULL. And yet we are the first State in the Union in the production of agricultural crops, but that is due to the soil.

Mr. MacDOWELL. Yes.

Mr. HULL. And I presume that even in Iowa we have found that we have got to go to the use of fertilizer.

Mr. MacDOWELL. Yes; in maturing your corn early and to get away from soft corn.

Mr. HULL. And the question all comes back to this main point; if you make the fertilizer cheap enough, you would increase the production very materially; is not that true?

Mr. MacDOWELL. If you will use fertilizers more extensively, you will increase the acre production very materially and cheapen the cost of growing a bushel of wheat or a bushel of potatoes.

Mr. HULL. The only limitation to that is the consumption of food products.

Mr. MacDOWELL. Yes; if you want to tackle it from that angle. The fertilizer industry does not think it would be good sense for the United States, for instance, to materially increase its production of wheat, but it might be good

sense for it to grow the wheat it does produce on fewer acres to make it cost them less per bushel, so they would have a greater spread between the market and what it cost them.

Mr. HULL. I would not want to get into an argument about that with you, because I do not agree with you at all on that proposition and I have had some experience. I do not think there is any such thing as overproduction.

Mr. MACDOWELL. I will admit from the economic standpoint that is true.

Mr. HULL. Not in the present state of the world.

Mr. MACDOWELL. I will admit that theoretically you are right on that, but what I mean is, broadly speaking, we have 300,000,000 bushels of wheat for export now, and we are having difficulty in selling it, and it would not be wise for us to go ahead and increase that to 500,000,000 bushels simply because we could produce it.

Mr. HULL. Of course, by decreasing production we might increase the price, but to me that is contemptible.

Mr. MACDOWELL. I am not speaking of decreasing production.

Mr. HULL. With the present state of the world, every time you increase the price of wheat, somebody starves in the world.

Mr. MACDOWELL. I am not talking about decreasing the production; I am talking about increasing the production per acre so you can grow it cheaper and so you can sell it cheaper and still make a profit, which is the other side of it.

Mr. HULL. That is like the farmer who started to burn his corn.

Mr. MACDOWELL. That is economically wrong, of course. I guess there is no dispute about our economics. I think we are in accord on that.

Mr. PARKER. Mr. MacDowell, I believe that the coke that comes to this plant at Muscle Shoals comes from Birmingham?

Mr. MACDOWELL. Very likely; yes.

Mr. PARKER. How much coke is made there in a year?

Mr. MACDOWELL. I have not any idea. They make quite a little sulphate of ammonia there. I have not any figures, and, as a matter of fact, it is very difficult to get that.

Mr. PARKER. How much ammonia do they make there?

Mr. MACDOWELL. That I could not tell you, but I know there are a number of thousands of tons made there a year.

Mr. PARKER. Is most of that coke made there by the old beehive oven or by the modern by-products oven.

Mr. MACDOWELL. None of it by the beehive oven, and all of it by the modern oven.

Mr. PARKER. And only some few thousand tons come out of it?

Mr. MACDOWELL. A number of thousands. I do not know how many. I have not any data on that feature of it, but it is a fairly considerable production, because there is a good deal of iron made there.

Mr. PARKER. I was trying to get at the amount of ammonia that was made there.

Mr. MACDOWELL. I could not say.

Mr. PARKER. That is, the amount of sulphate of ammonia.

Mr. MACDOWELL. I could not tell you, but there is a considerable production made there.

Mr. PARKER. With such a large iron business as exists there, would not that produce a very large proportion of the sulphate of ammonia used in this country?

Mr. MACDOWELL. No; if you will figure that you get from 18 to 20 pounds of sulphate of ammonia per ton of coal coked and will multiply that by the coking capacity of these different coking centers, you can tell something about what the production is from that standpoint; but, further, you have got the city gas plants and they are coming in very rapidly.

Mr. PARKER. I believe you stated that there is 60,000 horsepower installed in the plant at Muscle Shoals.

Mr. MACDOWELL. As I recall, there is 60,000 kilowatts, which is 80,000 horsepower.

Mr. PARKER. How much coal would that plant use a year?

Mr. MACDOWELL. I could not tell you.

Mr. PARKER. About how much?

Mr. MACDOWELL. I could not even give you an estimate on that. It is a very large amount.

Mr. PARKER. Three or four tons or more per horsepower, is it not?

Mr. MACDOWELL. I have not any figures on that.

Mr. PARKER. I was trying to find out whether it would be cheaper to make the sulphate of ammonia by this expensive process you have mentioned or to use the coal that went into it.

Mr. MACDOWELL. If you have use for the coke. Of course, you would not go into the coking business to get sulphate of ammonia.

Mr. PARKER. No; but in operating that plant, how much would you get out of it?

Mr. MACDOWELL. From 16 to 20 pounds per ton, coked.

Mr. PARKER. But you do not know how many tons are used in that engine?

Mr. MACDOWELL. No, sir; I do not.

Mr. PARKER. Do you use cyanamid as a fertilizer?

Mr. MACDOWELL. Very little—a few hundred tons. I think our greatest consumption has been 3,000 tons in one year, and that was some years ago.

Mr. PARKER. Is there any difference; or can you compare sulphate of ammonia and cyanamid for that purpose and state which is the best?

Mr. MACDOWELL. Cyanamid is a form of nitrogen which is classified—

Mr. PARKER (interposing). I do not want to go into the details, but which is the best for fertilizer?

Mr. MACDOWELL. Sulphate of ammonia is the best.

Mr. PARKER. Why?

Mr. MACDOWELL. Because it is not alkaline, and you can use it in much larger quantities per ton and make a much more concentrated fertilizer.

Mr. PARKER. And the cyanamid, you think, is alkaline?

Mr. MACDOWELL. Decidedly so.

Mr. PARKER. And can not be used in large quantities?

Mr. MACDOWELL. It is not recommended by the makers at over 60 pounds of cyanamid per ton of finished fertilizer.

Mr. PARKER. I believe it spoils your acid phosphate if it is used in larger quantities?

Mr. MACDOWELL. It reverts the soluble phosphoric acid in the acid phosphate; yes, and it also has a tendency to release the ammonia from other forms off into the air.

Mr. FIELDS. Mr. MacDowell, I was very much impressed by your reference to the condition of the country with regard to nitrates during the war.

Mr. MACDOWELL. Yes.

Mr. FIELDS. Figuratively speaking, we were on very thin ice.

Mr. MACDOWELL. Very thin. I was worried to beat the band, but I did not let anybody know it.

Mr. FIELDS. And you would recommend that the country exercise due precaution to prevent being confronted with that kind of a condition again.

Mr. MACDOWELL. I certainly would; yes.

Mr. FIELDS. Would you recommend the maintenance of the Muscle Shoals proposition for the production of nitrates for war purposes in time of need?

Mr. MACDOWELL. I would.

Mr. FIELDS. Would you recommend the completion of the dams there, with that object in view, if there was nothing else to be considered?

Mr. MACDOWELL. I would.

Mr. FIELDS. And you would recommend the maintenance of nitrate plant No. 2, if for no other purpose, in connection therewith?

Mr. MACDOWELL. I would; yes. I think there is no question but what in the interest of national defense until we get along past the troublesome days of to-day, we ought to keep everything of that sort handy, so that it can be made use of very quickly in case of need.

Mr. FIELDS. I am very glad to have the benefit of your views upon that subject. With regard to the consumption of fertilizer, there has been a general increase in the use of fertilizer from the first use of it, has there not?

Mr. MACDOWELL. Yes; it was increasing, I would say, from an average of about $7\frac{1}{2}$ per cent a year up to 1914. During some periods it would go to 10 per cent, but I would say an average of $7\frac{1}{2}$ per cent yearly increase up to 1914.

Mr. FIELDS. Have you informed yourself as to the number or the percentage of farmers in the United States who now use fertilizer?

Mr. MACDOWELL. I could not give you definite information as to the number. The largest consumption of fertilizer is in the coastal plains, starting with

Aroostook County, Me., and going clear down to Florida, with a little swing around on the Gulf. That is the point of largest consumption, and if you gentlemen would be interested, I have here some copies of maps prepared by the Department of Agriculture showing where the plants for fertilizer production are located and the tonnages made. I think it will give you an idea of the matter. This was gotten out by the Department of Agriculture as a result of their study of the situation.

Mr. FIELDS. The fact that the first use and the greatest use of fertilizer is in the older sections of the country is an indication that the use of fertilizer will continue to increase, will it not?

Mr. MACDOWELL. Oh, yes. Wherever they start them and study them properly there is a general increase. You may slip somewhat. You slipped last year, and you have gone down from 8,000,000 tons to less than 4,500,000 tons.

Mr. FIELDS. You attribute that, however, to the general condition in agriculture, do you not?

Mr. MACDOWELL. Yes, sir.

Mr. FIELDS. There is a very large percentage of the farmers of the country who have not yet begun to use fertilizer at all.

Mr. MACDOWELL. Yes.

Mr. FIELDS. And the fertilizer people take on new customers every year.

Mr. MACDOWELL. Yes; and they are having materials tried out, and they are doing everything they can with the State people to find out what is needed in a given section of the country.

Mr. FIELDS. I notice you referred a while ago to one very important point with regard to the use of highly concentrated fertilizers. You stated that if the fertilizer was too highly concentrated it would injure the seed.

Mr. MACDOWELL. Yes; or the root growth coming from the germination of the seed.

Mr. FIELDS. That must necessarily be overcome and doubtless will be overcome to a great extent by the invention of new machinery with which to apply fertilizer to the soil and by changing the methods of application, will it not?

Mr. MACDOWELL. Yes; depending on the crop on which it is used. I had more particular reference to the grains, where the cost of growing is such that they want to get the maximum fertilizer efficiency from a minimum application. Therefore they drill it right in with the grains and it is right in the hill with the short root growth of the grain. You know the grain roots do not cover a large territory; but if you are fertilizing corn, where the roots extend out and hunt around for their grub wherever they can smell it, then you adopt a different method of distribution.

Mr. FIELDS. In other words, to distribute fertilizer scientifically, you must distribute it according to the root of the plant which is to be fertilized?

Mr. MACDOWELL. Yes; and that is what we are studying, how best that can be done.

Mr. FIELDS. When the farmer first began the use of fertilizer, before he had any machinery for putting it on the ground, he would take a spoon and drop some fertilizer under each hill of corn.

Mr. MACDOWELL. Yes.

Mr. FIELDS. And he thought he got better results by putting all his fertilizer close to the plant.

Mr. MACDOWELL. Yes.

Mr. FIELDS. Whereas he has since learned that he gets better results by sowing it broadcast so the roots of the corn can feed on it and get water.

Mr. MACDOWELL. Yes; that is right.

Mr. FIELDS. And before we get to anything like a high state of development in the use of fertilizer, we must study more carefully the plants to be fertilized and the proper methods of putting the fertilizer in the ground.

Mr. MACDOWELL. Yes; that is right, and the other things which are necessary in the soil to make the fertilizer valuable, such as the bacteria which put a lot of this plant food in shape so the plant can take it. You see nitrate of soda, for instance, is carried all over the farm, and the plant takes it up. It is a nitrate. Sulphate of ammonia has got to be worked on by the bacteria and converted into a nitrate because it goes into the plant's stomach as a nitrate. So you have got to have food for the bacteria, and there is where your clovers and your organic matter come in.

Mr. FIELDS. And the agricultural experiment stations are working on this problem of the scientific development of the use of fertilizer.

Mr. MACDOWELL. Yes, sir.

Mr. FIELDS. And advising the fertilizer people on the one hand how to prepare the fertilizer, and the manufacturers of farming implements how to prepare the farming implements, and the farmer, on the other hand, how to use the combination of the two.

Mr. MACDOWELL. Yes.

Mr. FIELDS. All of which adds to the consumption of fertilizer by the farmer who has been using it for years and all of which also contributes new customers.

Mr. MACDOWELL. Yes; naturally. And I may say right there, gentlemen, that the way to get the cost of fertilizers down is for the farmer to buy more fertilizers. If you have a plant that is pitched to ship, say, 40,000 tons, and your various charges for your salesmen, office expenses, and everything of that sort are \$200,000, that is \$5 a ton. If that plant only ships 20,000 tons you have got a cost of \$10 a ton. If you can squeeze it beyond 40,000 and get 50,000 tons you have then less than \$5 a ton as your expenses. In other words, the fertilizer industry to-day has a capacity to make, I should say, from eleven to twelve million tons under forced draft. The biggest year it has had is 8,000,000 tons. It dropped down last year to \$4,500,000 tons. The industry lost millions and millions of dollars, and in addition to that it has sixty or seventy million dollars still out for 1920 and 1921 with the cotton farmers, and it is paying interest on it and sweating like the devil, wondering where it is going to come out. I just instance that to show you that increased tonnage cheapens the cost of fertilizer and cheapens that cost of fertilizer to the farmers, because the fertilizer man's salvation is tonnage. He is foolish if he tries to pitch his price at a point where he will not move the greatest possible tonnage through his plant, because that is the way he gets his cost down and makes his business more secure.

Mr. FIELDS. As a farmer who uses a good deal of fertilizer, I regret to hear you state that our only hope of cheap fertilizer is to buy more of it, because I know that it is very burdensome to pay our bills now for fertilizer.

Mr. MACDOWELL. Yes. I will say, gentlemen, that in the South to-day a pound of cotton will buy as much, if not more, pounds of standard fertilizer than it would in 1914. Now, that is not a healthy situation for the fertilizer people, because they are losing a large amount of money.

Mr. FIELDS. Of course, we all understand that every class of business is now shot to pieces.

Mr. MACDOWELL. Every effort has been made. Our greatest obstacle to cheap fertilizer is railroad rates. We are 122 per cent over 1914 in the North, and about 116 per cent in the South, and we have many instances where the freights on fertilizer are 200 per cent over what they were in 1914. When you consider that on an 8,000,000-ton outshipment you bring in materials and ship out to the extent of about 14,000,000 tons, you can see how your freight pyramids up on a proposition of that kind.

Mr. FIELDS. Since you have referred to the freight rates, that brings to my mind another question. If plans can be worked out whereby highly concentrated fertilizers may be used, that will relieve the farmers materially on freight rates, will it not?

Mr. MACDOWELL. Yes; and on bags and labor and every other item that goes into the making of fertilizer.

Mr. FIELDS. By reason of the elimination of all that dead weight; the bags must be furnished, and that requires so much labor to handle it, and everything else.

Mr. MACDOWELL. But you can go only so far, and as far as we can foresee, practically, we can only get a certain concentration, because you have to have a certain dilution, or you will get a soil solution strength there which is too strong. In other words, it is a question of distribution, scattering all over the acre of ground, or in the right place for that particular crop, if it is one that goes too far down for seedling purposes.

Mr. FIELDS. That is where we need to be studying more scientific methods all the time?

Mr. MACDOWELL. Yes.

Mr. FIELDS. Judge Parker suggests that I ask you whether fertilizer could not be diluted on the farm?

Mr. MACDOWELL. It can, if you have dry sand, or if you can pulverize clay clods. But until you get your farm consumption very much bigger than it is now it is not, broadly speaking, a practical thing. In Ohio they use only 14 tons of fertilizer on a farm, and they do not use a high enough grade. In

South Carolina they use something like 4 tons, while in New Jersey they use 5. Certain farmers handling the thing in a big way can do it. We are trying all the time to improve the situation; that is a big part of the fertilizer business.

Mr. PARKER. I wanted to know whether you can not help the situation by diluting it at the station.

Mr. MACDOWELL. We do that so much better. We have plants that ship out as much as 50,000 tons a year. The stuff has to be treated and mixed and given a certain treatment so that it will be drillable when it goes out. You can not keep fertilizers in bags for a long time and have a good drillable condition. Nothing makes the farmer madder, after he has gone over a good part of his farm, than to find that his drill has not been working. Furthermore, we ship our phosphate rock from Tennessee and Florida, but the bulk comes from Florida because it is cheaper than in Tennessee. But that is scattered around and shipped by boat from Tampa to New York and Baltimore and other places, but Baltimore is the biggest producing center in the United States. It is way beyond its capacity; they try to do too much there. Then it meets our sulphur, which comes from the Texas and Louisiana fields. As a matter of fact, Mr. Chairman, the raw material situation is largely a southern proposition. It is owned and manned largely by southern people—that is, the sulphur and the phosphate rock. As a matter of fact, the discovery that this calcium carbide could be made into cyanamid was made at Sprague, N. C., by some southern men working in one of their laboratories, where they were working on phosphate rock experiments.

There is one other point, in considering the practicable side of the Muscle Shoals proposition as a large fertilizer-producing section, and that is in connection with the facilities for shipment. Muscle Shoals is on two branch lines of railroads. There is always a car shortage in Atlanta, Birmingham, and Montgomery, and with the present business, not this last year, but under normal conditions, we have the greatest trouble in getting cars to ship out fertilizers, and we could do a bigger business if we could get more cars. But if you will notice the maps you will see that we are shipping from many sections. We have the greatest difficulty now in getting the cars to haul 350,000 tons of phosphate rock every year under normal conditions from the southern phosphate fields to the plants farther north.

Some suggestion has been made that this amount of nitrogen produced at this plant would make 2,000,000 tons of 2-8-2. But 2,000,000 tons means 100,000 cars carrying 20 tons each. During the shipping season that would mean from 800 to 1,000 carloads a day. But it is not practicable to figure on any tonnage as high as that. As a practicable proposition, it is very difficult to get the cars because other people are using them, and other sections of the country must have their fertilizers, and in my judgment it is not practicable to develop such an unusual fertilizer manufacturing and shipping plant at that point. That is purely a physical proposition.

Mr. FIELDS. But that point, like all other points in the country, has its infancy. Of course, there might be such development there as would justify the construction of greater transportation facilities.

Mr. MACDOWELL. Yes; and you have the river, and you may be able to barge some stuff. There are several large plants at Nashville on that river, but it is very seldom that they barge anything because they have not the barge facilities. Then, too, you have to keep fertilizers under cover. That means that you have to have facilities at the different stations along the river to properly take care of that stuff, and we have not got those facilities at the present time. But we hope we can get them, because that is one of the biggest things we can do, to develop a terminal for that stuff so that we will not have to pay so much dead freight. We are not there to-day, and it is a slow development.

Mr. QUIN. Mr. MacDowell, you are at the head of the Armour fertilizer industry?

Mr. MACDOWELL. Yes; I started that by-product business and developed it.

Mr. QUIN. How long ago?

Mr. MACDOWELL. It was started in 1894.

Mr. QUIN. That is their method of disposing of waste?

Mr. MACDOWELL. We found that we had these waste materials, and we wanted to increase the value of the hog, and we got into it for that reason, and to avoid being shut up as a public nuisance.

Mr. QUIN. How many factories have you?

Mr. MACDOWELL. We have, I would say, outside of the packing houses, some twenty odd plants around the United States, two in Cuba, one in Porto Rico, and then we have plants in South America and around the world.

Mr. QUIN. The ones where the packing houses themselves are located use a great many of the elements of waste from the stock which is slaughtered, do they not?

Mr. MACDOWELL. Everything that can not be better used for something else goes into those materials; yes.

Mr. QUIN. And you can produce your fertilizer cheaper at the factory close to your slaughterhouses than you can somewhere else, can you not?

Mr. MACDOWELL. If we were dependent on that material; yes.

Mr. QUIN. What fertilizer elements come from the stock yards?

Mr. MACDOWELL. Nitrogen and phosphoric acid. I may say as a matter of interest that within the last six or eight years much of the blood and a great deal of the tankage has been going out to Mr. Hull's country in Iowa to feed hogs, and we get the fertilizer only indirectly. Many of the packing-house products are getting into the feeds.

Mr. QUIN. Do you get any potash out of the slaughterhouse products?

Mr. MACDOWELL. No, sir. I may say that I developed the first potash mine in the United States, personally, out in Utah; but we do not get any potash out of by-product stuff.

Mr. QUIN. This country is short on that element of fertilizer, is it not?

Mr. MACDOWELL. As far as its own production is concerned; yes.

Mr. QUIN. We have been dependent upon importations from Germany, so far as potash is concerned?

Mr. MACDOWELL. Yes; and from France now.

Mr. QUIN. Do you gentlemen have any idea that any important sources for potash can be discovered here in the United States?

Mr. MACDOWELL. I have been hopeful that it can be made economically near Salt Lake City, to the west of Salt Lake City. I have had engineers go through that field very carefully, and as far as the cost out there is concerned, it can be made economically at Searles Lake in southern California.

Mr. QUIN. That is kelp?

Mr. MACDOWELL. No; that is some of the brines in the old, dry lakes. There is that plant there, and there are lakes out in Nebraska that make pretty fair potash. But the trouble is they are so far away from the coastal plain section, so that it would be difficult to make use of them because of the high cost of transportation. That is the difficulty, and I do not know how we are going to overcome it, although we may be able to get water transportation from Searles Lake later on. When I say that I mean that the industries are paying from \$13 to \$20 a ton freight charges on potash from Salt Lake City or from the brines of Nebraska down to the sections in the South where they use them. And we are getting our potash from France and from Germany to-day at \$2.70 a ton by water. There is your problem. I do believe that we will discover some way of developing some potash in this country, and that is one reason why I had Mr. Swann do some work in that section, because I was hopeful that he might stumble on something which would be beneficial.

Mr. QUIN. What are the ingredients of fertilizer that go into vegetables? You spoke of the trucking industry; just what do you mean?

Mr. MACDOWELL. You grow truck generally on sandy loams, with not over 8 per cent of clay, and if you get that you could in two or three weeks get a good start in maturing your truck. You use fertilizer there because the sandy soils are not very rich. You use quite concentrated fertilizer, especially on some truck crops, running as high as 15 per cent potash.

Mr. QUIN. What percentage of nitrogen do they use on the truck crop?

Mr. MACDOWELL. They run as high as 10 per cent of ammonia and 8½ per cent of nitrogen. That is one of the sections where they use a lot of nitrogen, and Aroostook County, Me., which is one of the most heavily fertilized sections of the world, and also the Hawaiian Islands, beat any other section. They use 2,000 pounds of a fertilizer containing 5 per cent of ammonia and often as much as from 6 to 8 per cent of phosphoric acid and from 7 to 10 per cent of potash.

Mr. QUIN. What do they use on cotton?

Mr. MACDOWELL. On cotton they use, speaking in averages, about 3 per cent of ammonia, 9 per cent of phosphoric acid, and 3 per cent of potash. The average has been going up. But the better planters are using higher grades than that, such as 4-10-4, and along that line. We have been putting out

ourselves an acid phosphate of 16 per cent. We do make it stronger than that, but to get it drillable we make a combination of 2-16-2. That is 16 per cent of acid phosphate, 2 per cent of ammonia, and 2 per cent of potash. On the other hand, to compete with the 1-8-1 stuff, which we do not believe is the economical thing for the farmers to use, we are putting in a combination of 2-16-2, which saves the farmer \$10 a ton.

Mr. QUIN. One method of applying fertilizer in the truck industry is by spraying, is it not?

Mr. MACDOWELL. No; that is used only a very little. It is mostly applied by broadcasting or with some drills. Broadcasting is rather an extravagant way in which to do it, however. They have found that drilling and putting it in little rows, with a certain application, will bring them more money than by using the broadcasting method, and thus using it rather extravagantly.

Mr. QUIN. They have a method of placing the fertilizer on the crop after the crop is up and partly worked out, do they not?

Mr. MACDOWELL. Yes; they do that in certain sections of the country, and that is what they call top dress. Sometimes they make a second, or even a third application.

Mr. QUIN. They have several methods; one is to put it down when they break the ground?

Mr. MACDOWELL. Yes.

Mr. QUIN. In a drill?

Mr. MACDOWELL. Yes.

Mr. QUIN. They have another method, by putting it down while they are planting?

Mr. MACDOWELL. Yes.

Mr. QUIN. And then they have another method by which they apply it by spraying the plants?

Mr. MACDOWELL. Yes; but the spraying method is not very heavily used, because the soil has the power of fixing the salts in the soil, and you do not want your roots to come up to the surface; you want the fertilizer to stay in the ground below the surface. They are just like dogs, they will go where the grub is, and you have to keep it down.

Mr. QUIN. We have the practical men understanding the different soil needs for fertilizer, and what the different types of crops need in the way of different percentages of fertilizers. Do you think the agricultural colleges and the experimental stations in each State, and the farm demonstrators in each county should deal directly between the fertilizer producer and the consumer?

Mr. MACDOWELL. You mean having them engaged in business?

Mr. QUIN. No; I mean telling the farmer what the soil needs.

Mr. MACDOWELL. That is our endeavor, so far as we can get them to do it; we think that is sound. But we do not believe the fertilizer industry should carry on experimental stations or do that work that the Government itself can do more impersonally than we can. We think that is their business to tell the farmer those things.

Mr. QUIN. And the national association of which you are president has that as one of its functions, to give the farmers what is best suited to their soils?

Mr. MACDOWELL. Yes; we are trying to help sell the work which these scientific men do in their stations. They really need it, because there is a wonderful lot of scientific development hidden away in pamphlets that nobody gets at. We do not think they are especially good salesmen of the work which they do. They are content when they make their reports.

Mr. QUIN. In the type of fertilizer for cotton which you are familiar with and sell in my country, how much of that in a ton is sand and waste?

Mr. MACDOWELL. That depends upon what kind of material you use.

Mr. QUIN. I said fertilizer for cotton.

Mr. MACDOWELL. Take 3-8-3.

Mr. QUIN. That is about what you have for cotton?

Mr. MACDOWELL. Yes; or about 3-9-3. There is 1,700 pounds of acid phosphate in it at the beginning. If you use cottonseed meal you have 60 pounds of fertilizer, 7 per cent, and it would take 800 pounds of cottonseed meal to give the 3; and that would be 1,000 pounds there, and 800 pounds of meal; and if you want 8 per cent you have only 300 pounds leeway there. If you use muriate of potash, you use roughly about 100 pounds of muriate of potash. Or if you do not use muriate of potash you would use some other form that did not give so much. And you could correct that without much trouble.

Mr. QUIN. That is the cottonseed meal is helping us in making fertilizer?

Mr. MACDOWELL. It is right now, although some of it is going in because the spinner wants it, he is asking for it, and it has to be given to him.

Mr. QUIN. The elements of fertilizer can be made at the Muscle Shoals plant?

Mr. MACDOWELL. There are two things you can make. One is your nitrogen and the other is the phosphoric acid, either in the regular way or by the electric-furnace method, if that works. As far as potash is concerned, you could bring your shales in there and make your potash. But I would say, in that connection, however, the cheaper thing would be to buy the French and German potash and ship it in here.

Mr. QUIN. If you can get the potash and the nitrogen, what is the other substance?

Mr. MACDOWELL. You have potash, nitrogen, and phosphoric acid.

Mr. QUIN. That makes fertilizer, does it not?

Mr. MACDOWELL. Yes; that is right.

Mr. QUIN. That is the complete fertilizer in the proper proportion to be applied on any crop?

Mr. MACDOWELL. You have to mix it to get your proper proportion.

Mr. QUIN. Those are the three fertilizer ingredients?

Mr. MACDOWELL. Oh, yes.

Mr. QUIN. And all of those fertilizer ingredients can be obtained from the raw materials that are at or in the vicinity of Muscle Shoals?

Mr. MACDOWELL. Or in that neighborhood; yes. For instance, at Birmingham they have sulphate of ammonia. They get phosphoric acid or phosphate rock from that territory and ship it in and treat it. They get their acid from the Tennessee Copper Co. And there is another illustration of the usefulness of fertilizer. The using of that acid permits the plant to run, and the plant employs thousands of people, which is its direct contribution to the welfare of that community through being able to use acid for fertilizer purposes.

Mr. QUIN. Commercial fertilizer is a necessity now?

Mr. MACDOWELL. In that section; yes.

Mr. QUIN. You have to get it through these leguminous plants, if you can not get it commercially?

Mr. MACDOWELL. Yes; that is the first thing to do, anyway.

Mr. QUIN. From the soya bean and other leguminous plants. In the absence of that the farmer is bound to have fertilizer, or you would not do any business.

Mr. MACDOWELL. Or in the presence of it, if he wants to get the best results.

Mr. QUIN. If they can make at Muscle Shoals these three ingredients of fertilizer, which are all they use—

Mr. MACDOWELL (Interposing). Outside of a little magnesium and a few other things.

Mr. QUIN. And put them in a concentrated form and get that concentrated fertilizer to the consumer, he can mix it or spray it, as the case may be. If that were done, would that not cut out the expense of shipping all of that filler?

Mr. MACDOWELL. In part he can do that to-day, and a good many farmers are doing it.

Mr. QUIN. Some gentlemen said they could not do it.

Mr. MACDOWELL. They are buying sulphate of ammonia, which contains 25 per cent of ammonia, and it is being shipped to certain fruit and truck farmers. They are doing it also with nitrate of soda. That is a part of the fertilizer business.

Mr. QUIN. There is no discount on the farmer being able to mix it with the filler, if he has any sand?

Mr. MACDOWELL. Yes; and if he happens to be located in the right location he can dry it and get it into shape to drill.

Mr. QUIN. You speak of a lack of shipping facilities from Muscle Shoals. Is it not a fact that with the concentrated form of fertilizer which would be sent out of there the large number of cars you refer to would not be required?

Mr. MACDOWELL. That is true if he does ship nitrogen which he makes; it would require fewer still.

Mr. QUIN. This project as contemplated proposes to improve navigation there so they can float those products on boats out into the Ohio River and send them out that way?

Mr. MACDOWELL. Yes.

Mr. QUIN. Then there would not be any objection to that, if you can make that stuff and get it to the seaboard at \$2.20 a ton?

Mr. MACDOWELL. We can do that now at Nashville, for instance, which is very close to the phosphate field. The plants are right on the river, but there are no barges and no facilities for handling it.

Mr. QUIN. Your association in the literature which was sent to each Member of Congress stated that obviously no matter how cheap the Muscle Shoals plant could make sulphate of ammonia, it could not greatly reduce the cost of commercial fertilizer.

Mr. MACDOWELL. Yes.

Mr. QUIN. You did not include in that statement the consideration of how cheaply they may produce phosphoric acid, did you? You did not figure that?

Mr. MACDOWELL. No; that was not figured.

Mr. QUIN. Did you figure on them producing the phosphate so close to that plant? It is very close to that plant?

Mr. MACDOWELL. Yes; it is very close to Nashville. The cheapest phosphorous beds are in Florida, at tidewater.

Mr. QUIN. They can produce the other ingredients there, too?

Mr. MACDOWELL. Yes.

Mr. QUIN. Then if these three ingredients of fertilizer could be produced at the Muscle Shoals plant, your statement could not apply, could it?

Mr. MACDOWELL. It would not apply in full force if they can produce these materials, which they have not commercially done. That is, potash has not been commercially produced. I do not think they have gone over 70 per cent utilization, and it is much cheaper to buy that potash from Germany than to try to make it. The phosphoric acid is cheaper to make by the acid process than by the other process.

Mr. QUIN. We will assume they could not make it. That is one of the elements. The other two elements can be produced at Muscle Shoals. In this big, yellow circle on the circular you sent out you say that the ordinary fertilizer has only 4 per cent, on the average of sulphate of ammonia.

Mr. MACDOWELL. On the average; yes.

Mr. QUIN. Then you say that the other necessary ingredients, such as organic ammoniates, nitrogen, potash, phosphoric acid, and the mixing, and bagging, and freight, and other necessary costs amounts to 29 cents. Is that a correct statement?

Mr. MACDOWELL. From the cost standpoint; yes.

Mr. QUIN. Then the ultimate consumer of the fertilizer is paying most of the expense of the fertilizer for the mixing, and the bagging, and the freight, and storage, and other charges on it.

Mr. MACDOWELL. He is paying quite a lot; yes.

Mr. QUIN. About what percentage now would you say that these real fertilizer elements amount to by the time it gets to the ultimate consumer? You are familiar with the business, and I would like to know your opinion of that percentage.

Mr. MACDOWELL. As I recall, freight is 35 per cent of the cost; that is, freight alone. The ingredients, if I recall correctly, as determined by the Department of Agriculture, normally constituted about 65 per cent formerly. Now, they do not constitute so much.

Mr. QUIN. That would include the whole 100 per cent?

Mr. MACDOWELL. I say now they do not cost so much, and we have figured the freight, which did not cost so much, to be about double, so that that makes the difference now.

Mr. QUIN. It is double what it was before the war?

Mr. MACDOWELL. Yes. The big element of cost lately has been lack of business.

Mr. QUIN. Do you mean that fertilizer costs more because you do not sell so much of it?

Mr. MACDOWELL. Yes; the expenses are almost doubled on that end of the proposition.

Mr. QUIN. But what have you to say about the fact that the farmer is not able to buy it?

Mr. MACDOWELL. That is one of the difficulties at the present time. You can not get your costs down by not doing business. You have got to get your costs down by doing business. That is what we want to do if we can.

Mr. QUIN. We want to know why it is that they can not cut out all this expense of this filler, and the freight, and the cost in handling it.

Mr. MACDOWELL. Because up to date it has not been thought advisable by agriculturalists to use too concentrated mixed fertilizers. And further than

that, the farmer himself has his own liking for fertilizers which we think are not strong enough, and we are trying to get him to use stronger fertilizers.

Mr. QUIN. Mr. MacDowell, where they have the farm demonstration agent to give the farmers instruction as to the proper way of mixing that, do you not think it is a matter of knowledge between the commercial fertilizer manufacturer and the farmer, and that knowledge should be carried to the farmer?

Mr. MACDOWELL. Yes; he has the knowledge, and if he wants to do it, he can mix the fertilizers any time he wants to try it; there is nothing to prevent him from doing it. But you must remember that fertilizers are shipped in car-load lots, whereas fertilizer ingredients are shipped in less than carload lots. And if the consumption on the farm is only a ton and a quarter, as it is in Ohio, it is cheaper to take low-grade fertilizer and try to fuss with it himself, but when we get into big trucking operations it is a different proposition. I will say this, that we prefer, as an industry, to ship high-grade goods.

Mr. QUIN. I presume you read the evidence of Mr. Ford's engineers?

Mr. MACDOWELL. No, sir; I did not.

Mr. QUIN. If Mr. Ford can make this fertilizer in any form of finished product, or in a concentrated form, do you not think it would make it cheaper to the farmer if that cost is so much less than it would be elsewhere on account of the cheap water power?

Mr. MACDOWELL. I do not know how much power would come in on that proposition, but the farmer can get concentrated fertilizers to-day. Just what Mr. Ford is proposing to make. As a matter of fact, there is 4 per cent super-phosphate made to-day, and it is unsalable. The American Cyanamid Co. put in a plant to make ammonium phosphate, the very thing which they have been talking about making at Muscle Shoals. But the plant is closed; they can not afford to run it.

Mr. QUIN. They belong to the National Fertilizer Association, do they not?

Mr. MACDOWELL. I think they do; they are an associate member.

Mr. QUIN. There is another company making fertilizer, the Virginia-Carolina Chemical Co. They are members of the National Fertilizer Association?

Mr. MACDOWELL. Yes.

Mr. QUIN. That plant at Muscle Shoals was constructed for the manufacture of nitrates in time of war, and fertilizer in time of peace, was it not?

Mr. MACDOWELL. Well, they hoped to make it in time of peace; yes.

Mr. QUIN. If Mr. Ford says he can make this fertilizer there—and he said that through his representatives at a hearing by this committee—at 50 per cent less than it is being made for to-day, would not that be a great boon for the people of this country?

Mr. MACDOWELL. He can not do it unless he steals his stuff, and I am quite sure he could not do that.

Mr. QUIN. Why then is your association so much opposed to this plant down there being devoted to the manufacture of fertilizer by Mr. Ford?

Mr. MACDOWELL. We have not any objection to Mr. Ford manufacturing fertilizer, if he wants to get into it. But we have this stock, as I explained earlier, that Congress is asked to put in 800,000 or 850,000 horsepower, with electrical equipment, in order to be able to use 100,000 horsepower to produce nitrates. Is that sound from the standpoint of public policy?

Furthermore, the fertilizer industry felt that the Congress should know more about the fertilizer business and the need for additional fertilizer now. One of the great troubles with this country and the world is that there is about 150 per cent of over normal capacity in everything. We have got a big excess of capacity in fertilizer to-day. We have a big excess of capacity in sulphate of ammonia, which will be made at Muscle Shoals. Simply because you have something you can make something out of, we do not believe it should be used to make it unless there is need for it. If Mr. Ford goes into the fertilizer business, we will compete with him, and if we can not we will get out of the business. We have to take a risk. We have made all these developments, and if we can make these things more cheaply by reason of improved development we think we ought to have a chance as well as Mr. Ford, and we do not think he should have a monopoly down there.

Mr. QUIN. Did you not have a chance to bid on this plant?

Mr. MACDOWELL. Fertilizer people would not bid on a proposition of this kind.

Mr. QUIN. The invitations were sent out generally.

Mr. MACDOWELL. I know, but it is not a fertilizer proposition. As to the phosphoric acid, I do not agree with some of the gentlemen in regard to that.

I think there are opportunities there of making concentrated fertilizers cheaper than by the acid method, quite materially cheaper than by the acid method. But I say, as a practical proposition, supplying stuff to the farmers all over the country, you can only go so far, because these concentrated fertilizers have been made for 85 years. They have been making this concentrated stuff in Belgium and Holland for a number of years, but they have to send it away to get rid of it. There have been two companies making this triple-strength stuff, and they have either only been able to sell a limited amount of it or they can not do it at all, although it is shipped all over the country. That is the triple-strength phosphate. It takes time to work those things out.

Mr. QUIN. I see that they are using the concentrated fertilizer in large quantities in my country. I know they are using it.

Mr. MACDOWELL. Yes; and we sell a lot of it. We would like to sell more of it.

Mr. QUIN. Then these gentlemen who say it can not be done are ignorant on that subject?

Mr. MACDOWELL. I will say that from the standpoint of fixing nitrogen, Mr. Ford can not compete at Muscle Shoals with the cost of the present methods of recovery from by-product coke, and we have a surplus from that.

Mr. QUIN. With the scientists at work all the time, and with Mr. Ford's ability to get the best scientists on his staff, do you not presume that in a short time this industry will be revolutionized and that the fertilizer products will be at a much cheaper price than at the present time?

Mr. MACDOWELL. I hope so. I am working to that end as fast as I can.

Mr. QUIN. Did you not state that in five years' time the present method will be obsolete?

Mr. MACDOWELL. I think so; yes.

Mr. QUIN. It is not unreasonable to think that Mr. Ford should begin to make it cheaper very soon?

Mr. MACDOWELL. He could not use his equipment and would not need all that power for that purpose.

Mr. QUIN. He could use such of it as he did need for that purpose.

Mr. MACDOWELL. Well, I think he could use the power to better advantage making something else.

Mr. QUIN. You do not think he is going to let that power go to waste?

Mr. MACDOWELL. No; I think not.

Mr. QUIN. You know that Mr. Ford, as a business man, would utilize it?

Mr. MACDOWELL. Yes; and I think myself that it is a tremendous amount of power to put in the hands of one man to say who shall use it. Furthermore, from the engineering standpoint, I think that you are interested to see that he develops as much of the primary power—

Mr. QUIN (interposing). That is what he is going to do down there: we can not do it. This man proposes to do that very thing, to develop 1,000,000 horsepower.

Mr. MACDOWELL. There is large secondary power. You have, from an engineering standpoint, only got 150,000 primary horsepower down there. I think you ought to go to work and reservoir it back so that there will be from 250,000 to 350,000 primary power down there. You do not want to have an industry established and working down there for four or five months in the year, and have all those men hunting after jobs for the balance of the year. You do not want to have the industries down there in such a condition so that when you first wake up in the morning you have to go out and find out whether there is enough power to work with during the day. Those are our problems. It ought to be balanced and worked upon sound engineering lines, and the fertilizer business is with you on that feature of it. Where we get an industrial section developed it is better for the farmer in finding a sales market for his truck crops.

I only wanted you to know that there is no need at the present time, and probably will not be for some time, for the nitrogenous fertilizer which it is proposed to make at Muscle Shoals. I wanted you to know that Germany and England will be in the market and control the price, because those things come in duty free and they can control the price over here, and that Chile has got to sell stuff to get buying power in this country, and we want to sell her something. As far as I can see there is no danger of nitrogen starvation in this country for a long time.

From the preparedness standpoint you should keep this nitrate plant. In my judgment. If you want to work out the financing of it as best you can, you can sell nitrate plant No. 1, and you can sell a lot of things. As I under-

stand it, it has been estimated that the things down there have a value of approximately \$18,000,000, which is \$11,000,000 more than Mr. Ford offers for it. You can sell the whole proposition and have the nitrogen-fixation plant available, if necessity demands its use, and you can commandeer the power at any time. You can keep up the nitrogen-fixation plant on an economical-investment basis, hold it until there is need for it for fertilizer purposes. Let us hope there will be no need for it for war purposes. That is my thought in connection with it.

The CHAIRMAN. My recollection of the testimony before the committee is that Ford says he can make the fertilizer about one-third cheaper than what it is being sold for now. I do not remember that he said he could make it one-half cheaper.

Mr. QUIN. Mr. Mayo stated, and I asked him about it, whether he could make it 33½ per cent cheaper, and he said he could; and then I asked him if they could make it one-half cheaper, and he said certainly.

The CHAIRMAN. It may be you are right about it, but I remembered very well his statement about making it one-third cheaper.

Mr. FISHER. Mr. MacDowell, were you with the War Industries Board while the building of the nitrate plants was going on?

Mr. MACDOWELL. Yes, sir.

Mr. FISHER. So far as the transportation of the material to that point was concerned they were able to get material transported there to build those two enormous plants?

Mr. MACDOWELL. Yes, sir.

Mr. FISHER. It is on the main line of the Southern Railway, and there are two branch lines of two other roads that run into Muscle Shoals?

Mr. MACDOWELL. Yes, sir.

Mr. FISHER. You were in a very important position on the War Industries Board, and I take it it was part of your duties to keep the United States prepared, in so far as nitrates were concerned, for a supply of ammunition for 4,000,000 men?

Mr. MACDOWELL. Yes, sir.

Mr. FISHER. Throughout that period of time, while you were giving that thought serious study, you did come to the conclusion that the United States should have prepared itself, so far as its supply of nitrates was concerned, before the war?

Mr. MACDOWELL. Yes.

Mr. FISHER. If the Committee on Military Affairs is presented with a program of nitrate preparedness which has the indorsement of the Chief of Ordnance, that plan ought to be very carefully considered by the committee before being rejected, ought it not?

Mr. MACDOWELL. I would think so; yes.

Mr. WRIGHT. Mr. MacDowell, you think this plan of the utilization of concentrated fertilizer will gradually come about?

Mr. MACDOWELL. We are working in that direction, but how far it will go I do not know, because there are certain soil problems in the use of it that stand in the way of going too far.

Mr. WRIGHT. You would be interested in making concentrated fertilizer?

Mr. MACDOWELL. We want to make concentrated fertilizer.

Mr. WRIGHT. You can sell concentrated fertilizer to as good advantage as you can sell fertilizer with the filler.

Mr. MACDOWELL. We do not use much filler. Of course, we do make a lower-grade stuff. For some of our stuff you might pay 60 cents a unit for it in Baltimore. However, you could use the 50-cent stuff, and you would use it because it is cheaper and it can be used with the so-called filler. That is true all the way through. As you get into the more concentrated materials you want to get into the more concentrated finished goods, because the filler is a hard thing to get; you do not like to get it, you prefer not to use it, because you prefer the concentrated stuff.

Mr. WRIGHT. When you put in the filler, it is put in so that the fertilizer is properly distributed?

Mr. MACDOWELL. Yes; and to use all of the proper materials. For instance, you may use waste beet slop and get 1 per cent ammonia in that mixture without any filler, practically. You may want to use 7 or 8 per cent of cottonseed meal to make 1 per cent, and you have to put some filler in because you are using a more concentrated material. We are trying to get where we can make standard things, and we are trying to utilize everything that comes off the farm

and send it back to the farm. We are trying to do all those things by consolidations which we think are important in the interests of the country and of the world. We ourselves as an industry are trying to be helpful and give service to the country. I think I can safely make that statement.

Mr. WRIGHT. You are a practical fertilizer man and have devoted a great deal of time and thought to the industry. I had always thought that the proper way to intelligently use commercial fertilizer was to first have your soil analyzed and ascertain from that analysis what elements of plant food it possessed and then supply the deficiency.

Mr. MACDOWELL. That does not always work.

Mr. WRIGHT. I understood Prof. Whitney to say that that had not proved a success.

Mr. MACDOWELL. Because sometimes the soil particles are coarse, and you find stuff that can not get to the surface.

Mr. WRIGHT. If that is not the correct way, how would you do it?

Mr. MACDOWELL. We try it on the ground by using different formulæ.

The CHAIRMAN. You spoke of Searles Lake?

Mr. MACDOWELL. Yes.

The CHAIRMAN. In what part of California is Searles Lake?

Mr. MACDOWELL. It is in San Bernardino County, about 150 miles northwest of Los Angeles.

The CHAIRMAN. It is down there near what is called Death Valley?

Mr. MACDOWELL. Yes; it is a little bit to the west of Death Valley; and we have a good many millions of tons of potash in there.

The CHAIRMAN. Is not the ownership of that claimed by a Germany company?

Mr. MACDOWELL. No; on the contrary there are two plants there. One of them is owned by the Trawna Co., which was almost entirely British, with some American capital. The other is owned by the Solvay group, now a part of the larger Allied Chemical Co., I think they call it. There is no German element there as far as I know, or anything approaching it.

The CHAIRMAN. There has been a good deal of discussion about the ownership of that lake.

Mr. MACDOWELL. Yes; there was trouble to begin with. At first it was located as a Trawna deposit, and there was some trouble in reference to the ownership. I think the English Goldfield groups had a mortgage there. I knew about that very early, because it has been the custom for persons to ask me about potash when any new possibility comes up.

The CHAIRMAN. I remembered what I read in the papers in San Francisco, and there was some difficulty about the ownership. Is not that one of the reasons why they have not been finding so much potash there?

Mr. MACDOWELL. No; I do not think so. They had trouble in reference to the titles. Part of that territory was withdrawn from entry under the President's proclamation, and then they had to work under the leasing bill, to know how it could be gotten hold of. So I think the Trawna Co., the first company, did not have that trouble on part of that property because they had located and had their titles early. The trouble has been that in the first place there is borax in the brine. They make borax, and some of it hurt the crops in certain sections. But they have overcome that, and they have a very good thing, but their rate is very high, and with the German and the French going back to prewar prices on potash they could not possibly meet the situation.

Mr. MCKENZIE. Mr. MacDowell, you are speaking here as the representative of the members of the American Fertilizer Association?

Mr. MACDOWELL. The national association; yes, sir.

Mr. MCKENZIE. And in your statement before the committee, of course, you are expressing the views of the members of that association?

Mr. MACDOWELL. Yes, sir; and probably some views of my own developed by the questioning, which they do not know anything about.

Mr. MCKENZIE. I was listening to your statement and your testimony, and from it I draw the conclusion that the people whom you represent object to the Ford proposition on two grounds; first, that it is against public policy for the Government to recognize such a proposition; in the second place you object because you believe that under the terms of the proposed contract Mr. Ford would be given advantages which would make him an unfair competitor with the members of your association.

Mr. MACDOWELL. He might be; yes.

Mr. McKENZIE. In other words, you fear that operating under the so-called contract Mr. Ford would have an advantage over the present manufacturers of fertilizer.

Mr. MACDOWELL. He might have; I am not stressing that point strongly; I am trying to present to you gentlemen the broad viewpoint of whether there is need for making this contract from the fertilizer standpoint.

Mr. McKENZIE. Coming down to your objections, those are your two objections?

Mr. MACDOWELL. Yes.

Mr. McKENZIE. And they are the objections of the members of the American Fertilizer Association?

Mr. MACDOWELL. Yes.

Mr. McKENZIE. Otherwise you would have no objections.

Mr. MACDOWELL. We have not any objections to Mr. Ford's going into the fertilizer business if he wants to go into it.

Mr. FIELDS. In that connection, however. Mr. MacDowell, you do not know of anybody in the United States who would assume the burden of maintaining a nitrate plant for the protection of the Government in time of stress without some compensation for it.

Mr. MACDOWELL. No; I do not know of anyone who knows the fertilizer industry who would want to take over that plant and want to operate it now.

Mr. FIELDS. I did not apply my question exclusively to manufacturers of fertilizer. You know of no citizen who would do that.

Mr. MACDOWELL. I do not know of anyone who knows anything about the business who would be willing to do that, from that standpoint alone.

Mr. FIELDS. So if the Government is to maintain this as a preparedness proposition it must do this or it must lease it to somebody, to some individual under such terms as will enable him to do it.

Mr. MACDOWELL. Yes.

Mr. FIELDS. We must accept one or the other of those propositions?

Mr. MACDOWELL. Yes.

Mr. MORIN. What percentage of fertilizer used in this country can Mr. Ford produce, if he manufactures to the full capacity of the plant, and deliver to the farmer?

Mr. MACDOWELL. That is very difficult to say, because it is divided into two parts. He could ship 110,000 tons of nitrate without any trouble, and 200,000 tons of sulphate without any trouble. But going into the manufacture of complete fertilizer, it is a question of how much he could do. I think the biggest fertilizer plant we have in the United States has a capacity around 300,000 tons, and every one of them is much too big. The way they make fertilizer and distribute it now is to go out into the territory where the goods are used, and then they ship in their rock without any filler, and then they ship in their sulphur without any filler, 99½ per cent pure, and they make this sulphuric acid, and make those formulas right there. In normal times you would have this large number of plants which would give this service in a particular section. If you will look at the maps you will see the large number of small plants which have been developed on that theory. So far as the cost is concerned you can make fertilizer cheaper at ports than in the interior, because you can get the phosphate rock out from Florida for \$2.15 per long ton by water, and you can not get it on a railroad for that amount. You can not bring up your sulphur for \$2 a ton, and there is no land freight on the potash. So you can make it much cheaper at the ports than you can in the interior. Nevertheless, there has been quite a development of plants in the interior because there is service to be gotten. It is quite a job to distribute four or five million tons in four or five lots when the cars are scarce and the labor is scarce. It is all fixed stuff, worked under chemical processes.

Mr. MORIN. I thought I understood you to say that you understood Mr. Ford could make the fertilizer, but it would be impossible for him to ship it because of the shipping conditions.

Mr. MACDOWELL. Yes, sir; that is the point.

Mr. MORIN. He could not get the cars in there?

Mr. MACDOWELL. They expect you to ship out your maximum in three months in the South, and it would be practically impossible to start that in the last of January and finish it about the last of April. It has to be done in that time.

Mr. MORIN. He could only supply a very small percentage of the fertilizer used?

Mr. MACDOWELL. He would have to go a long way to do it, because there is very little fertilizer used around Muscle Shoals.

Mr. MORIN. You do not think, as a fertilizer producer, it would be of very great benefit to the country at large to have him go into that business?

Mr. MACDOWELL. He would be of service wherever he could reach, but as to the possibilities of supplying any large territory, I do not think he could do it, for physical reasons, as well as for lack of facilities.

The CHAIRMAN. The committee is very much obliged to you. You have given us a lot of valuable and interesting information.

(Thereupon the committee adjourned at 4.30 o'clock p. m. to meet to-morrow, Wednesday, February 22, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Wednesday, February 22, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

STATEMENT OF MR. GRAY SILVER, WASHINGTON REPRESENTATIVE AMERICAN FARM BUREAU FEDERATION, MUNSEY BUILDING, WASHINGTON, D. C.

The CHAIRMAN. Mr. Silver, I take it you are fairly familiar with the matters the committee has been considering for the last two weeks. Will you kindly state your name in full and the position you occupy?

Mr. SILVER. My name is Gray Silver, and I am the Washington representative of the American Farm Bureau Federation.

The American Farm Bureau Federation is greatly interested in the subject you have under consideration, Mr. Chairman, from several viewpoints.

The question of developing the water powers, in a broad way, is of great interest to the farmers, but in this particular proposed development the farmers are interested greatly in the fertilizer end as well as in the other proposals, and I will read you resolutions passed by our groups at different times recently to show you that it is not without mature study and thought on this case that they speak.

At the annual meeting of our national association in Chicago on March 4, 1920, they adopted a resolution as follows:

"We support the measure pending in Congress looking toward the operation of the nitrate plant No. 2 at Muscle Shoals for the production of nitrogen fertilizer compounds."

The CHAIRMAN. What is the date of that resolution?

Mr. SILVER. That was in 1920. That goes back some time.

The CHAIRMAN. That goes back to a period before Mr. Ford made any offer at all.

Mr. SILVER. Yes; I am presenting that to show that they are not recent converts to it.

The CHAIRMAN. Who was figuring on Muscle Shoals at that time?

Mr. SILVER. This was when the proposal was before Congress that they complete the dam and the Government operate it.

The CHAIRMAN. I understand.

Mr. SILVER. They were interested at that time and have been interested since.

Last fall at their annual meeting at Atlanta, Ga., in November, 1921, the following resolution was adopted, and in our national meetings practically every State is represented, because all but two of the States of the Union have State federations, and we have a large membership, and in this meeting of some 5,000 farmers this resolution was adopted:

"We recognize in the Muscle Shoals nitrate water-power project in Alabama such an essential measure to secure the preservation of our soil resources as well as to develop the industrial and transportation facilities of our Nation. that we urge the Congress of the United States to authorize the Secretary of War to enter into such contract or contracts with Henry Ford for the own

pletion and continuous operation of the project as will protect the public welfare. If such authority is not promptly given, we reserve the right to institute such action as will guarantee the completion and operation of this enterprise under Federal supervision."

At a meeting of the southern group, as we call it, of the American Farm Bureau Federation, composed of some 15 States, with visitors from 12 or 14 other States, the following resolutions was adopted on January 20, 1922:

"Several hundred farmers, representing the many thousands in organized agriculture from 15 Southern States, as well as delegates from the West and far West, after careful investigation of the dams and power plants at Muscle Shoals, Ala., believe it to be an economic crime to continue to allow this development to lie idle and uncompleted.

"As a means to proper development we unreservedly indorse Henry Ford's offer to lease and operate the power and nitrate plants.

"We reiterate the stand taken at the last meeting of the Farm Bureau Federation in indorsement of the Ford offer.

"We recommend that Congress authorize the issuance of bonds necessary to to complete the dams at Muscle Shoals. This will avoid the necessity of taking funds direct from the Treasury. Henry Ford's offer would pay interest on such bonds, and the first earnings from the sale of electrical energy would amortize the bonds."

This resolution was adopted after the convention had visited the property itself at Muscle Shoals.

The CHAIRMAN. Where was that convention held?

Mr. SILVER. At Florence, Ala.

The CHAIRMAN. That is right at Muscle Shoals?

Mr. SILVER. That is right by the Muscle Shoals property; yes.

Secretary Wallace called a conference of those engaged in agriculture and related lines, as we use the expression, which met in the city of Washington on January 23 to 27, 1922, and the following resolution was adopted at that meeting, with farmers and others participating:

"Resolved, That to accomplish results without any further delay whatsoever we urge the Secretary of War to recommend and the Congress to accept Henry Ford's proposal to take over the hydroelectric power and air nitrate plants at Muscle Shoals under a guaranty to operate same for 100 years at its present capacity of approximately 100,000 tons of ammonium nitrate per annum, opening the Tennessee River to navigation, cheapening the production of fertilizer, metals, and other commodities, and assuring the United States nitrogen independence in peace or war."

That resolution gives you the thought and the proof that this subject has been in the farmer's mind, and in order to go into it very fully and not, perchance, to make any mistake, the American Farm Bureau Federation appointed a committee and had that committee visit Muscle Shoals and make a report to the American Farm Bureau Federation, which report I shall not read unless it is wished but will offer it for the record. If you do not care, I am not particular about its being printed in the record, but I am offering it simply to show that we have studied the matter carefully and to show that the conclusions arrived at, as evidenced by the resolution, are not without a proper and full study and a full understanding of what we think is involved, both in the Ford proposition at Muscle Shoals as a waterway and as a fertilizer development.

The CHAIRMAN. If there is no objection, we will put that report in the record.

Mr. FIELDS. I think, Mr. Chairman, a report made after a careful study by an organization like this ought to go into the hearings.

Mr. PARKER. How long 's it?

Mr. SILVER. Thirty-six pages.

The CHAIRMAN. It represents practically the opinion of the farmers who are members of your organization?

Mr. SILVER. Yes.

The CHAIRMAN. I think, as making up a part of the record, it might be well to let it go into the record.

Mr. SILVER. Thank you, Mr. Chairman.

(The report referred to follows:)

REPORT OF THE MUSCLE SHOALS COMMITTEE OF THE AMERICAN FARM BUREAU FEDERATION.

To the Executive Committee of the American Farm Bureau Federation.

GENTLEMEN: Your committee which was appointed to investigate the Muscle Shoals project has performed that duty in the double capacity of personally inspecting plants and by collecting the available information from all sources for your consideration. We beg leave to report as follows:

I. INTRODUCTION.

Since the signing of the armistice on November 11, 1918, many of the operations in which the Federal Government found itself engaged prior to that date have been discontinued on account of a peace-time basis not requiring certain war expenditures and activities to be continued. It is with a great degree of gratification that all citizens see our Government gradually discarding all expenditures and all projects that were purely incidents of the great war. There are a few undertakings, however, the necessity for which had been seen before our entrance into the war, that deserve the fullest consideration both by urban rural citizens to ascertain whether or not it is best to continue them indefinitely for the good of the general public.

There is no problem of conservation more vital than that of preserving the fertility of the soil of our country. Those who dwell in cities are essentially as much interested in this task as are those who actually till the fields. The food of our Nation must come largely from a well-preserved soil, and that soil necessarily must carry, either naturally or in the form of fertilizers, the proper nitrogen content. It has been said repeatedly that agriculture in its broadest sense has been neglected by the Federal Government in various ways. It is hoped that a genuine national policy of soil conservation and food production will be furthered at this time by taking such action relative to securing an adequate and economical supply of nitrogen as is recommended elsewhere in this report.

The outstanding war-time project which can be continued as a peace-time undertaking while at the same time retaining all its war-time functions for public safety is the Muscle Shoals project in Alabama. On account of the magnitude of this project not only in size but in importance to the whole Nation, your committee has thought it well to report in a comprehensive way and at some length. For clarity of presentation the subject matter has been divided into 11 parts with frequent comment by the committee and with two very definite recommendations at the conclusion of the report.

II. WHAT WAS SEEN AT MUSCLE SHOALS.

(a) The Tennessee River at Muscle Shoals, from which power is to be taken to operate the nitrate plants and for other purposes, is as large, taken at the mean or average flow, as is the Ohio River at Cincinnati, Ohio, the Mississippi River at Dubuque, Iowa, or the Missouri River at Omaha, Nebraska.

(b) The banks of the Tennessee River at Muscle Shoals are of such height that a hundred foot head of water may be held without building any retaining walls or dikes whatever except the dam proper.

(c) The pool formed by the dam will extend for a distance of 15 miles up stream, and the total amount of land flooded or damaged by the water is 9,000 acres. This area has been bought and paid for by the Government with a very few exceptions where condemnation proceedings are now nearing completion. This land was secured at an average price of less than \$45 per acre.

(d) The Wilson Dam is about one-third completed and more than one-third paid for, as will be seen when the immense expenses attached to the preparatory work are considered, which expenses do not again have to be met in finishing the project.

(e) Two sections of the Wilson Dam—one at the north bank and one in the center of the river on an island—are partially completed. There yet remains for construction on these sections the discharge gates at the top and the roadway above the gates.

(f) The foundation is laid for a large portion of the rest of the dam and the protecting cofferdams have been removed.

(g) The excavations for the power plant and south section of the dam have been made under protection of an immense cofferdam which will permit work to be carried on in that section if the work is not too long delayed.

(h) A construction bridge carrying several railroad tracks, and supporting seven derricks, each capable of lifting 10 tons, has been built.

(i) Twenty-five miles of railroad track have been laid to haul supplies, rock, sand, cement, concrete, etc.

(j) Several locomotives, some of which weigh 65 tons each, have been used constantly in hauling material to the concrete mixers and thence to the dam.

(k) Three mixing plants with capacity to keep all the other equipment moving at full speed have been installed, one on the island near the center of the stream, one on the north shore, and one on the south shore.

(l) A large construction camp has been erected with individual homes for married men, bunk houses and mess buildings for single men, and administration offices and residences for the official corps.

(m) The Wilson Dam is 4,100 feet long; its base, which is sunk 12 to 15 feet into the solid rock of the river bed, is 160 feet wide; its height from the original river bed to the bottom of the overflow gates is 80 feet and to the roadway on the top 120 feet. This structure when completed will be the largest single piece of monolithic concrete construction in the world.

(n) Two locks for navigation purposes are being constructed at the north end of the dam, each one having a lift of 45 feet, and with other dimensions adequate to accommodate the largest river craft.

(o) Nitrate plant No. 2 at Muscle Shoals stands to-day fully equipped and capable of producing 110,000 tons per annum of ammonium nitrate.

(p) The site on which this plant is built comprises approximately 2,000 acres.

(q) At the height of operations on this plant 20,000 workmen were employed. It was built in one year, and the first ammonium nitrate was produced one day less than a year from the time of starting construction work. At that time 90 per cent of the mammoth plant was finished, and to-day it is 100 per cent complete for the production of fixed nitrogen.

(r) The steam power plant was built so that nitrate plant No. 2 could begin production without waiting for the completion of the Wilson Dam, which was expected to take approximately three years. This steam plant produces nearly as much electrical energy as any other steam plant ever built and contains one steam turbine unit with electrical generators which generates 60,000 kilowatts or 80,000 horsepower—being one of the largest turbines ever constructed and operated. In addition, there is place for a smaller unit which would be capable of producing 30,000 kilowatts, or 40,000 horsepower, making a total horsepower for the entire steam power electric plant when completed of 120,000 horsepower, which is ample to operate the electric furnaces in another part of the plant.

(s) The boiler room of this immense plant comprises a battery of 15 units, each rated at 15,000 horsepower. These boilers when running full capacity consume approximately 1,500 tons of coal each day, which fuel is dumped from the cars on overhead tracks into vast bins, and thence fed into the furnaces by automatic stokers without being touched by human hands since leaving the mine. The three stacks to provide draught for these furnaces vary in height from 275 feet to 300 feet, and in diameter at the base from 23 feet to 26 feet.

(t) The kiln room where the lime rock is burned to lime contains seven cylindrical kilns which turn slowly and which are heated by a blast from finely ground coal. These kilns are of steel, lined with fire brick, and are so mounted that the lime rock when placed in the higher end will gradually travel the entire length of the kiln, which is 125 feet and emerge from the lower end as burned lime. Approximately 1,500 tons of lime rock can be burned in a day, which shrinks in the form of burned lime to about one-half that weight.

(u) The electric furnace building where the burned lime and coke are fused electrically into carbide, as the first step toward fixing nitrogen, is about 1,000 feet long and contains 12 electric furnaces, each of which requires 10,000 horsepower for its operation. Only 10 of these furnaces are expected to operate at any one time, leaving 2 for repairs at all times. The giant electrodes through which the electrical current passes and which furnish the heat for fusing the burned lime and the coke, are subjected to such terrific heat that they have to be renewed every three days. This shows the necessity for extra furnaces.

Each furnace produces 50 tons of carbide per day, or a total for the 10 furnaces of 500 tons. Practically all work of handling the materials used in nitrate plant No. 2 is done by machinery. However, these electrical furnaces must be fed by hand in order to fill the blowholes that appear in the molten mass, which, unless filled by shovelfuls of coke and lime, cause rapid radiation of heat.

(v) The plant where nitrogen is taken from the air by the liquid-air process is many times larger than any similar plant ever constructed. In this plant nitrogen testing 99.9 per cent pure is secured in volumes aggregating 500,000 cubic feet every hour. The oxygen and a small part of the nitrogen are returned to the atmosphere.

(w) The oven building contains 1,536 ovens in which the nitrogen is fixed or caught in the carbide. Each oven is about 3 feet in diameter and 5 feet deep, holding approximately 1,600 pounds of carbide. This charge is heated, electrically, to white heat, and the nitrogen from another building is forced through it and is caught. The product from these kilns is cyanamid or lime nitrogen and contains 21 per cent of fixed nitrogen.

(x) The autoclave building contains 56 cylindrical steel autoclaves, which are steam-tight, vertical boilers with agitators to stir the powdered cyanamid in order to drive off the ammonia gas. Each autoclave holds four tons of the powdered cyanamid, and it takes about an hour and one-half to get the fixed nitrogen out of the cyanamid and into the form of ammonia gas in order later to convert it into ammonium nitrate for military or agricultural purposes.

(y) Many smaller buildings, each of which is indispensable in the complete process through which lime, coke, and air must go in order to get nitrates for either explosives or fertilizers, are component parts of the gigantic whole of nitrate plant No. 2. In all there are about 30 buildings as units in this plant.

(z) Nitrate plant No. 1 is a much smaller plant than No. 2 and is designed to secure nitrogen from the air and fix it for military or agricultural uses by an entirely different process than the one used in No. 2. It has never operated on a commercial or practical scale but is completely equipped for operation.

COMMENT BY THE COMMITTEE.

The information given above contains some remarkable facts which your committee feels free to comment upon, not in the way of specific recommendations but rather that you may be informed what relation these facts bear to our welfare as citizens and as farmers.

(a) That the Wilson Dam contains the possibility of developing a hydro electric plant far in excess of any yet contemplated in America—with the exception of Niagara Falls—is evidenced by the fact that it will maintain a head of water almost 100 feet high and has the volume of flow referred to in H. R. 11,000, whereas the great Keokuk Dam across the Mississippi River holds only a 40-foot head of water.

(b) There seems to have been no graft in the Government's acquisition of the land which will be inundated. The average price paid for this land seems to your committee to be entirely within reason; furthermore, there appears no likelihood of litigation subsequent to such inundation.

(c) Millions of dollars, undoubtedly, have been spent in the preparatory work which necessarily had to precede actual construction. Now that all this preparatory work has been done and paid for, it is the thought of your committee that legislation and appropriation should be provided for in Congress to avoid the loss of all this preliminary construction.

(d) The engineers in charge of construction work on the Wilson Dam state that although only about one-third of the permanent work has been completed more than one-third of the total expense has been met on account of the cost of the preparatory work.

(e) Your committee is impressed with the necessity for a resumption of building operations on the dam, which were discontinued in April on account of a lack of appropriations.

(f) It is needless to state that the great steam plant which is capable of running all of nitrate plant No. 2 was built only to operate the plant until the Wilson Dam could be completed and furnish a cheaper power. The steam plant should now be considered as an auxiliary power plant to the hydroelectric development, as nitrates can be made much cheaper with hydraulic rather than with steam power.

(g) Your committee desires you to remember that in the fixation of atmospheric nitrogen in the lime-nitrogen process some substance must be made that will soak up nitrogen somewhat as a sponge does water. Carbide, which is made by fusing lime and coke in an electric furnace, is the material used in nitrate plant No. 2. However, it is a chemical reaction that takes place, and not a physical one.

III. AVAILABILITY OF NITRATE PLANT NO. 2 FOR MANUFACTURING FERTILIZERS.

It is a generally recognized fact that up to a certain point the manufacturing of nitrates for military or for agricultural uses follows a common course. This is true whether the nitrates are atmospherically fixed or obtained otherwheres. In this report, of course, we are primarily concerned with the form of nitrates which is secured from the air, as the other forms have been longer used and more fully understood. There are three great sources of commercially used nitrates. First in tonnage is Chilean nitrate; then the ammonia secured as a by-product from coke ovens; and finally atmospheric nitrogen, which until recent years has been a dream of scientists, but is now very practical and is rapidly forging ahead in the tonnage produced. To these three may be added a fourth source, which is the use of legumes in fixing atmospheric nitrogen, and which farmers are coming more and more to value. This is nature's way of taking fertilizer out of the air and placing it in the soil in tubercles on the roots of legumes. Man has recently learned how to do the same thing mechanically and chemically.

In the fixation of atmospheric nitrogen, either for military or agricultural purposes, several steps are necessary before we have a commercial product. In order that there may be a clear understanding of the process used in nitrate plant No. 2 at Muscle Shoals, an effort will be made herewith to detail in non-technical and comprehensible terms the various stages in the process.

1. Lime rock is burned into lime and mixed with dried coke which has been finely powdered.

2. This mixture is melted together in electric furnaces which generate a heat exceeding 1,500° C. The product of these furnaces is known as carbide, which is the same product that is used in all acetylene lighting plants.

3. The carbide, after cooling, is ground through various machines until most of it will pass through a screen having 200 meshes to the square inch.

4. Air being formed of a mixture of nitrogen and oxygen, and only the nitrogen being needed for this process, the two gases are separated, first, by compressing and cooling the air until it becomes liquid, then distilling this liquid to separate the two gases, much in the same way that alcohol is separated from water in making spirituous liquors.

5. This nitrogen is then blown gently through ovens, in which the powdered carbide has been heated electrically to a white heat; and the result is that the carbide catches or fixes the nitrogen, in a manner very similar to the "soaking up" of water sprayed into a box of sand.

6. Now we have lime nitrogen (cyanamid), which is the first form of air-fixed nitrogen either for military or agricultural uses. It carries about 21 per cent fixed nitrogen and is directly available as a fertilizer but has some limitations in its use.

7. The lime nitrogen after being ground to a fine powder is treated to a bath of steam and a weak alkali under pressure of about 150 pounds to the square inch. This causes a gas to be formed, known as ammonia.

8. About half of this ammonia gas is mixed with air, and by being passed through an electrically heated platinum gauze the gas-air is heated to 600° C. When this superheated mixture is suddenly subjected to a low temperature it begins to change to nitric acid, much as the moisture in a cloud condenses into rain drops when struck by a cooling wind. The cooling process is continued until all the ammonia is changed into a 50 per cent nitric acid.

9. The other half of the ammonia gas is then forced into tanks which hold the nitric acid and is absorbed by the acid. This gives us ammonium nitrate in liquid form. This process is comparable to the method of making carbonated water in which a gas is forced into the water and held there.

10. This liquid ammonium nitrate is subjected to heat, and evaporation removes all the liquid, leaving a pure ammonium nitrate, which, when cooled in revolving pans in which there are stirring paddles, gives us a grained powder not unlike sand in appearance and which carries 35 per cent of nitrogen. We all know that sorghum, when subjected to the proper heat for too long a time,

crystallizes into sugar. A very similar crystallization process happens in the case of this liquid ammonium nitrate.

11. If sulphuric acid is substituted for nitric acid in the process described under paragraph 10, we will have ammonium sulphate instead of ammonium nitrate. Sulphuric acid to use in the production of ammonium sulphate can be purchased or made in the plant. When the Government plant at Nashville, Tenn., for the production of explosives was disposed of at the close of the war part of its equipment for the production of sulphuric acid was retained and shipped to Muscle Shoals and is now available for installation at nitrate plant No. 2 if it is found necessary to do so.

12. Either one of the above-named products is readily adaptable to fertilizer uses.

COMMENT BY THE COMMITTEE.

1. Your committee desires to suggest that in dealing with the whole proposition of manufacturing nitrates for military or agricultural uses the location of the plants is of prime importance. Nitrate plant No. 2 at Muscle Shoals, in connection with the Wilson Dam, has the following remarkable list of advantages in location:

(a) Practically inexhaustible quarries of the purest lime rock are easily accessible. The present quarries are only 28 miles removed.

(b) Coke, which combined with burned lime in the early stages of the process used at nitrate plant No. 2, is produced in large quantities in the coal fields of Tennessee and can be transported quickly to Muscle Shoals. The greatest coke-coal beds in the Nation lie between the Tennessee and the Ohio Rivers.

(c) The greatest deposits of raw phosphate rock in America are in Tennessee, which adds the possibility of using phosphate rock in electric furnaces and producing phosphoric acid and available phosphates as well as nitrates.

(d) Coal beds of immense proportions almost surround Muscle Shoals, all within easy hauling distance. Great quantities of coal are needed to burn the lime rock as well as to operate the great steam power plant as an auxiliary to the water power. There seems to be no need of nitrate plant No. 2 producing its own coke, as this product can be purchased economically from coke ovens already operating. The same statement may be true relative to sulphuric acid in making ammonium sulphate.

(e) The Tennessee River is a navigable stream and so offers cheap transportation, both for supplies needed at the plant and for products shipped therefrom, to the whole Mississippi, Missouri, and Ohio River systems.

(f) Muscle Shoals is located in the heart of the great fertilizer-using section of our Nation, but is also situated agriculturally somewhat near the center of the whole country.

(g) Muscle Shoals is far enough inland to be considered in the safety zone for war time. That is, if an invading army should land on the Gulf shore the distance to Muscle Shoals is so great that this plant would be comparatively safe and could continue making nitrates to repulse the enemy.

(h) With the immense water-power development incident to the completion of the Wilson Dam there is the certainty that much of the electrical power can be sold for industrial uses other than operating nitrate plant No. 2. Within easy transmission distances of Muscle Shoals lie the metropolitan centers of Birmingham, Ala.; Memphis and Chattanooga, Tenn., not to mention others of considerable importance. The great coal operations of this territory may be expected to become users of electric current, too.

2. It will be permitted the committee to remark that the cheapness of any fertilizer depends to a very large extent upon the ease and simplicity with which it is manufactured, and that the more frequently it is handled or treated in the process of manufacturing the more expensive it becomes. Consequently the cheapest fertilizer which is capable of being produced at Muscle Shoals is the lime-nitrogen (cyanamid). This product is a good nitrogenous fertilizer when used by itself, but carries much more nitrogen than the usual mixed fertilizer and must be used carefully. When only a nitrogenous fertilizer is needed lime-nitrogen gives as good results as are secured by any other form of nitrogen, but is somewhat slower in its availability. However, in mixed fertilizers the lime-nitrogen, if used in too great quantities, causes the phosphates to become less soluble, and hence less available as plant food on account of the lime reacting unfavorably on the phosphates. It is fair to state, though, that the chemists seem nearly to have a treatment for the lime-nitrogen which

will remove this undesirable characteristic. It is entirely to be expected that with further experiment these difficulties will be entirely overcome.

When lime-nitrogen is advanced through its subsequent stages and is changed into ammonia gas, then to nitric acid, and finally into ammonium nitrate or ammonium sulphate, it can be readily used, either alone or in mixed fertilizers. All these later stages, as above stated, increase the cost of the nitrogen content of whatever product is manufactured.

3. In this report but little mention will be made of nitrate plant No. 1. The process designed to be used in that plant is entirely different from the one in No. 2, and, although it is comparatively a simple chemical process, the mechanical difficulties have been such as to offer great difficulties to a practical operation of the plant. Your committee desires the permission to suggest, however, that its faith in the ability of our chemists is so great as to justify us in holding nitrate plant No. 1 intact ready to operate when the difficulties shall have been overcome. Accordingly you will note in one of the two definite recommendations at the end of this report that your committee has incorporated both nitrate plants in the same recommendation.

IV. NECESSITY FOR AN INCREASED NITROGEN SUPPLY.

The world's supply of nitrogen comes from two great classifications—the organic and the inorganic. The organic nitrogen is supplied by such commodities as tannage, dried blood, and cottonseed meal. These products are rapidly being transferred from the fertilizer field to the stock-feeding industry. It has developed that the feeder of live stock can compete in the purchase of these products much to the disadvantage of the feeder of soils who desires to use them as fertilizers. Their use as fertilizers is rapidly ceasing, but a constant increase is noted for these products as stock food. So we may as well not consider these organic nitrogenous products in summing up our available fertilizer supply. Their use is comparatively negligible as plant food.

Our inorganic nitrogen comes almost wholly from three sources. First in importance, as measured by the tonnage used, is the Chilean nitrates. Next in tonnage produced comes the coke ovens, from which a form of nitrogen is secured as a by-product. In recent years a third source has been developed in the fixation of atmospheric nitrogen. The development of methods, especially the lime nitrogen or cyanamid process for fixing, or capturing, the nitrogen that is in the air, has assumed such importance in recent years, not alone in our country, but in several other nations, as to justify the statement that the world's increasing demand for nitrates in industry for military purposes and in agriculture will be met largely by the fixation of atmospheric nitrogen.

A review of the present situation as regards the Chilean nitrates and the by-product from the coke ovens will serve to confirm the statement made. In the period between 1913 and 1920 the production of Chilean nitrates increased only about 28 per cent, although the whole world was seeking nitrogen. This may be accounted for partly by the falling off of the nitrate content in the Chilean product, which requires the handling of a much larger tonnage of the raw material to satisfy the world needs. The available nitrogen in the Chilean product has dropped from nearly 30 per cent, where it was in former years, to less than 20 per cent now. This signifies, no doubt, that the best beds of the nitrate deposits have been used. Also, it may seem that inaccessibility of the remaining beds makes production much slower than was formerly the case. Whereas, a laborer years ago was able to produce more than 70 tons per year, now the same laborer is producing approximately 55 tons.

The production of nitrogen as a by-product from coke ovens is altogether dependent upon the growth of the steel industry. Coke is produced primarily as an adjunct to the production of steel, and can not profitably be produced in quantities in excess of the requirements of the steel furnaces. In other words, it can not be produced simply for its by-products, which are nitrogen, tar, gas, and oil. Somewhat more than half the coke of our country is produced in ovens which can save the by-products, but the old-fashioned beehive coke ovens are not being superseded, although they produce nothing but the coke and do not save the by-products. This may point to the conclusion that as more ovens are built, or old ones remodeled, the determining factor in their operation is the production of coke and not the by-products. So we should not expect the coke industry to lead out in nitrogenous production when its development is dependent upon the growth of another industry—steel. The increase

in the production of nitrogen from these coke ovens in the period between 1913 and 1920 was slightly more than 19 per cent.

But the statistics, as usually given, representing ammonium-sulphate production from the by-product coke ovens do not state the exact conditions from the fertilizer standpoint. To look at the statistics one might think that in 1918, for instance, there were produced 408,237 tons of ammonium sulphate available for use in agriculture. This is by no means the case, for this figure represents the amount of sulphate of ammonia that would have been produced in 1918 if all the ammonia in all forms that was obtained from the by-product ovens had been made into ammonium sulphate. The facts are that nearly half of this amount given as ammonium sulphate is never available for agriculture. In 1918 the actual production of ammonium sulphate was 218,194 tons, according to the United States Geological Survey report. As a general average, 45 per cent of the so-called ammonium sulphate represents simply the production of ammonia in gaseous form, which is absorbed in water and is sold as aqua ammonia for refrigeration and other industrial and domestic purposes, and is never made into ammonium sulphate at all. The demand for ammonia in this form is met, first, by the by-product coke ovens, and what is left after these industries have been provided for, is converted into ammonium sulphate and sold as a fertilizer ingredient. In other words, the ammonia product of the coke ovens seeks the refrigeration rather than the fertilizer market.

In opposition to the slow growth of nitrogen production in the Chilean nitrates, and in coke ovens, it is significant to note that for the years 1913 to 1920 the production of atmospherically fixed nitrogen enjoyed a growth of approximately 783 per cent. It is also worthy of note that the world took all this nitrogen and asked for more. We may confidently expect the use of nitrogen in fertilizers, in ammunition, and in industry to constantly expand. This expansion will be measured largely by the price of the nitrogen sold. If it can be manufactured and placed on the markets cheaply, and cease to be—as it now is—the determining factor in the price of all mixed fertilizers, we may look forward to a multiplied use of nitrogen. Farmers know that their operations are rapidly depleting our soil of nitrogen, and they willingly would replace this ingredient in the soil if it could be had reasonably. A reasonable estimate of the annual nitrogenous loss from our soils will be between three and four million tons, to balance which we had in 1920 a total world's production of nitrogen of only one and one-half million tons, not all of which was available for us, of course. To feed the world and to make at least a temporary profit in farming, we must continue to mine our soils until we can mine the air and take from it cheap nitrogen.

In view of the probable insufficient supplies of nitrogen from Chile and from the by-product coke ovens, it is somewhat alarming to know that our consumption of nitrogen is doubling every decade. Whether this increase can be maintained—and it can be accelerated under the most favorable conditions for producing and marketing cheap nitrogen—depends almost wholly upon the development of the air-fixation industry.

COMMENT BY THE COMMITTEE.

By way of suggesting conclusions your committee calls attention to these pertinent facts:

- (a) That the world is running behind in the production of nitrogen.
- (b) That the price of Chilean nitrate is increasing as its supply becomes more inadequate.
- (c) That the United States alone paid in 1919, \$85,000,000 for Chilean nitrate.
- (d) That the United States has paid, including 1919, altogether for Chilean nitrate, plus freight, insurance, etc., approximately \$800,000,000.
- (e) That this vast expenditure justifies us in seeking other sources of nitrogen.
- (f) That nitrogen either by itself or in mixed fertilizers should be placed on the market at a valuation which is not so nearly prohibitory of its use.
- (g) That to secure a lessened valuation in nitrogen it must be taken from the air, where it is inexhaustible.
- (h) That since only about 55 per cent of our estimated total consumption would be produced by our own nitrogen plants of all descriptions, including nitrate plant No. 2, there is only a remote possibility of overproduction for the present decade.

(i) That the by-product coke ovens are not to be considered as primarily producers of fertilizer ingredients, because, first, their production depends upon the steel industry; and, secondly, their products are sold as much as possible in the form of aqua-ammonia, and the remainder only as ammonium sulphate.

V. COSTS AND ESTIMATES.

A. NITRATE PLANT NO. 1.

3 large buildings.....	\$7, 195, 496. 71
13 smaller buildings.....	2, 270, 418. 97
Railways, land, walks, village, etc.....	3, 788, 661. 05
Total	13, 254, 571. 73

B. NITRATE PLANT NO. 2.

Approximate total expenditures.....	<u>\$69, 026, 833. 43</u>
Overhead, Air Nitrates Corporation.....	\$3, 504, 628. 14

Construction expenditure.....	67, 166, 369. 83

C. THE WILSON DAM.

Various estimates have been offered as to the total cost of this dam, but as conditions relative to cost are changing so rapidly it is impossible to secure great accuracy. Two estimates are herewith submitted. The first one is based on conditions as they were in 1919, and is being held on that level in order to be definitely sure that the final cost can not exceed the figures given. The second estimate is based on conditions as they were in 1916, but there has been added in each item a 100 per cent increase, in the hope that such an arbitrary increase will approximately represent the difference in the cost factors in the year 1916 and at the present time.

(A.)

Allotted for construction, as per national defense act of 1916.....	\$13, 160, 000. 00
Transferred from armament and fortification fund June, 1910	<u>4, 000, 000. 00</u>
Total allotments to date.....	17, 160, 000. 00
Total approximate expenditures and commitments to date.....	16, 650, 000. 00
Amount to be asked from Congress.....	10, 000, 000. 00
Approximate total cost (based on 1919 conditions).....	<u>\$50, 000, 000. 00</u>
Amount properly allotted to navigation purposes.....	<u>4, 500, 000. 00</u>
Net cost for power purposes.....	45, 500, 000. 00
Production cost, one horsepower per year (based on average horsepower 300,000 and a 10 per cent interest and operating expense)	15. 00

(B.)

General engineering and offices expenses.....	\$2,275,000.00
Camps, general plant, railroad constructions.....	2,212,000.00
The dam proper.....	4,127,000.00
Locks.....	1,064,000.00

Total.....			67.47			8,444,000	38.00

¹ When the Wilson Dam is complete, the cheaper water power will be available. If we assume this to cost \$0.00075 per kilowatt hour, the cost of cyanamid fertilizer will be reduced to \$30.85 per ton. It should be noted that the power cost of \$0.00075 per kilowatt hour, used in this and the following tables is not as large as will be placed upon the power which is sold, but represents approximately what may fairly be charged against nitrate plants for power.

One ton of lime nitrogen when oiled and hydrated produces 1.10 tons of commercial cyanamid.

Cost of 1 ton commercial cyanamid (\$38) divided by 1.10-----	\$34.55
Cost of oil and oiling-----	.75
Bagging-----	1.75
Research and main office-----	2.10
Total, commercial cyanamid-----	39.15

E. MANUFACTURING COST OF AMMONIUM NITRATE AT UNITED STATES NITRATE PLANT NO. 2.

[Based on a two-weeks' run with steam power.]

Item.	Two weeks' test at approximately 20 per cent capacity, production 950 tons; cost per ton of nitrate.			Estimated cost of manufacture with lime-nitrogen plant running 100 per cent capacity; 20 per cent of the product being converted into 22,000 tons of nitrate.			
	Quantity per ton of ammonium nitrate.	Unit cost.	Cost per ton of ammonium nitrate.	Quantity per year.	Unit cost.	Total yearly cost.	Cost per ton of nitrate.
Limestone..... tons..	4.04	\$2.25	\$9.08	77,790	\$1.25	\$97,200	\$4.42
Coke..... do.....	1.09	9.75	10.62	24,000	6.00	144,000	6.54
Coal..... do.....	.33	4.25	2.22	9,340	4.00	37,360	1.70

Overhead.....			40.38			100,000	4.56
Total.....			157.60			1,770,640	80.48
Royalties per present contract.....			6.27			254,000	11.55
Operating fee.....			5.00				
Total.....			168.87			2,024,640	92.03
Bagging.....							2.00
Research and main office.....							5.63
Total.....							99.66

NOTE.—When the Wilson Dam is complete, the cheaper water power will be available. If we assume this to cost \$0.00075 per kilowatt hour, the cost of nitrate will be reduced to \$90.03 per ton.

1. MANUFACTURING COST OF AMMONIUM SULPHATE AT UNITED STATES NITRATE PLANT NO. 2.

Estimated cost of manufacture with lime nitrogen plant running 100 per cent capacity; 40 per cent of the product being converted into 86,000 tons of sulphate.

[Based on a two-weeks' run with steam power.]

Item.	Quantity per year.	Unit cost.	Total yearly cost.	Cost per ton of sulphate.
Limestone	155,560 tons.	\$1.25	\$194,450	\$2.27
Coke	48,000 do.	2.00	288,000	3.35
Coal	18,580 do.	4.00	74,720	.87
Electrodes	3,360,000 pounds.	0.05	168,000	1.96
Power	255,482,400 kilowatt-hour.	0.004	1,022,000	11.99
Sulphuric acid	82,600	10.00	826,000	9.60
Miscellaneous materials and supplies			447,500	5.21
Labor			1,033,000	12.01
Total			4,053,670	47.15
Overhead			198,000	2.30
Total			4,251,670	49.45
Royalties per present contract			582,000	6.77
Total for 86,000 tons of ammonium sulphate			4,833,670	56.22
Assuming 65 per cent would be shipped in bulk, the cost of bagging the remainder prorated is estimated at50
Research and main office				3.41
Total				60.13

NOTE.—When the Wilson Dam is complete, the cheaper water power will be available. If we assume this to cost \$0.00075 per kilowatt-hour, the cost of sulphate will be reduced to \$50.58 per ton.

G. ESTIMATED COST (EXCLUSIVE OF INTEREST CHARGES) OF PRODUCING PHOSPHORIC ACID BY THE ELECTRIC-FURNACE METHOD, ASSUMING POWER AT \$25 PER HORSE-POWER YEAR.

Item.	Quantity (tons) "mine run."	Cost of material per ton, Tennessee.	Cost per ton of acid (P_2O_5) raw rock.	Quantity (tons) "washed."	Cost of material per ton, Tennessee.	Cost per ton of acid (P_2O_5) raw rock.
Phosphate rock				3.32	\$7.00	\$22.24
Phosphate matrix	3.73	\$1.60	\$5.40			
Sand	1.50	.50	.75	1.50	.50	.75
Coke75	4.50	3.37	.75	4.50	3.37
Operating expenses: Electrodes, \$2.13; labor, \$4.45; power, \$44.01			50.59			50.59
Total cost per ton			60.11			76.85
Total cost per pound03+			.04—

NOTE.—When we assume power to cost \$0.00075 per kilowatt hour (\$0.0005625 per horsepower hour) and use this cheaper hydroelectric power, the power item will stand at \$4.92 per horsepower year instead of at \$25 as is used in the above table, which is approximately the commercial rate for power. This will reduce the operating expense for power as estimated above from \$44.01 to \$8.66 and give a total cost per ton for "mine run" of \$35.35 and for "washed" of \$41.60; or, per pound of 0.01767 and 0.0208, respectively.

The estimates in the table given above are all based on a ton production of P_2O_5 . To transfer these estimates into terms of 16 per cent acid phosphate it is necessary to remember that there are only 320 pounds of P_2O_5 in a ton of acid phosphate. By taking the pound costs in the table and multiplying them by 320 we ascertain the cost of 16 per cent acid phosphate, which will give us for the "mine run" \$9.60 and for the "washed" \$12.80. With power from the hydroelectric installation, these prices further reduce to \$5.65 and \$8.65 respectively per ton of acid phosphate.

The figures in the above table and notes constitute what will doubtless be a very spectacular development relative to fertilizer prices.

H. ESTIMATED SUPPLY AND CONSUMPTION OF NITROGEN FOR 1924 AND 1930, IN TONS OF PURE NITROGEN.

	1924	1930
Estimated peace-time consumption in—		
Agriculture.....	172,000	285,000
Industries.....	120,000	150,000
Military explosives.....	2,500	3,000
Total consumption.....	294,500	438,000

The sum of 4 and 5 when compared to 3 gives the amount of nitrogen fixed in the soil or taken from the soil in growing the plant.

In 6 the s:gn (*) means the pounds of nitrogen fixed in the soil and (†) means what has been taken from the soil.

It seems that not all clover and cowpea fields enrich the soil by chemical action.

No figures are available in this connection relative to alfalfa.

The average yield per acre of alfalfa hay in the United States for 1920 was 2.74 tons. This hay analyzes 2.3 per cent of nitrogen, which gives us 0.063 tons of nitrogen, or 126 pounds in each ton of alfalfa hay. How much of this is drawn from the air and how much from the soil has not yet been definitely determined.

The average yield per acre of red clover hay in the United States for 1920 was 1.46 tons. This hay analyzes 2 per cent of nitrogen, which gives us 0.029 tons of nitrogen, or 58 pounds, in each ton of red clover hay. It would seem, from the above table that many red clover fields are drawing upon the nitrogen reserves of the soil instead of adding thereto.

J. WATER POWER AT MUSCLE SHOALS.

[Based on flowage records of 19 years.]

Horsepower in stream.	Months available.	Horsepower used and wasted with—					
		4 power units.		10 power units.		18 power units.

VI. THE REPORT OF THE NITROGEN PRODUCTS COMMITTEE OF THE MINISTRY OF MUNITIONS OF WAR OF THE BRITISH GOVERNMENT.

The greatest contribution to the literature relating to the fixation of atmospheric nitrogen that is now available is the report of the committee of eminent Englishmen, 24 in number, who were appointed in June, 1916, to investigate fully all the scientific and industrial problems incident to the creation of a nitrogen-fixing industry in the Empire. This report contains 36 large pages, and is the result of months of painstaking work on the part of the committee. The final report of this committee was made in May, 1919.

It will be of decided value in our study of the Muscle Shoals project to know what conclusions were reached by the nitrogen products committee. Consequently, space in this report is being taken for several quotations from the English document.

"(A) A large addition to the home output of ammonium sulphate, coupled with the increasing competition of synthetic nitrogen products, would undoubtedly cause a reduction in its market price, and this would be of advantage to agriculture and to the export trade.

"(B) It appears probable that undertakings of this character would have to receive the support of the Government or be carried out entirely as national projects.

"(C) The main characteristics of the cyanamid process are:

"(a) The relatively small power requirements per unit fixed as contrasted to the arc process.

"(b) The direct production of a solid nitrogenous fertilizer (lime nitrogen), thus avoiding the costs incurred in all the other established synthetic processes for converting liquid products into a solid, marketable form.

"(c) The production of a cheaper marketable form of combined nitrogen than is obtainable by any other fixation process.

"(d) Its great adaptability as regards the products obtainable.

"(D) There seems no reason why manufacture both of carbide and also of calcium cyanamid (lime nitrogen), if laid out on a large scale, should not be successful in this country. There are blocks of undeveloped water power in Scotland of sufficient size for the operation of a large factory.

"(E) The market price of a metric ton of combined nitrogen in the United Kingdom prior to the war varied from 66 pounds to 67 pounds (in the form of ammonium sulphate and Chile nitrate, respectively).

"(F) The synthetic processes can produce a metric ton of combined nitrogen at a cost at the factory of from 20 pounds to 30 pounds.

"(G) The synthetic processes can produce a metric ton of concentrated (93 to 96 per cent) nitric acid for about half the cost of the Chile nitrate retort process.

"(H) The synthetic processes can produce a metric ton of combined nitrogen ready for the fertilizer market, as cyanamid ammonium sulphate, at a cost at the factory of about or even less than one-half the prewar market price of combined nitrogen in the United Kingdom.

"(I) A large proportion of the synthetic plant would find an application under peace conditions for the manufacture of nitrogenous fertilizers, either for home consumption or for exportation.

"(J) As compared with the retort process (used in connection with the Chile nitrate) the saving in the running costs over a period of two years would probably cover the initial capital outlay.

"(K) Dealing broadly with the postwar demand, the requirements of agriculture are certain to be much larger than formerly, the imperative need for maintaining and extending the world's production of food, and the vital importance of combined nitrogen for this purpose, having emerged as the salient lessons of the later stages of the war.

"(L) The consumption of combined nitrogen practically doubled in the 10 years before the war. When account is taken of the relative areas under cultivation in the food-producing countries of the world, of the prewar consumption of nitrogenous fertilizers in the most progressive of the agricultural countries, and of the corresponding consumption in the remaining countries, it is abundantly clear that the quantities of nitrogenous manures employed were in many cases below the most advantageous or profitable level. The difficulties experienced during the war period in obtaining supplies have already provided a salutary lesson as to the importance of fertilization, and the resulting wider recognition of the value of fertilizers will lead to an increase in the demand

for nitrogenous manures in countries where the consumption has hitherto been very small in proportion to the area under cultivation. In the opinion of the committee the provision of a really cheap supply of fixed nitrogen would lead to a greatly extended consumption of nitrogenous fertilizer.

"(M) There will be also an increased industrial demand for fixed nitrogen. Nevertheless, the total requirements for industry are unlikely to amount to more than a relatively small proportion of the demand for agriculture.

"(N) It is evident that the supremacy of the Chile nitrate industry is already being challenged, and the near future holds out the prospect that ammonium sulphate of synthetic nitrogen products may become the dominant factor in the nitrogen market and govern the price of nitrate instead of following it as hitherto.

"(O) The proved utility of Chile nitrate as a fertilizer, however, is such as to insure its position in agriculture for a long time to come, but the extent of the demand under postwar conditions will be largely determined by the price at which the product can be marketed.

"(P) Other things being equal, however, the preponderating factor in determining the future consumption of combined nitrogen in agriculture will be the price at which it is procurable. The possibilities in this direction due to the development of the synthetic nitrogen industry have already been indicated, and in the event of adequate supplies of fixed nitrogen being forthcoming at a price showing even a moderate reduction upon the prewar figure, the committee is strongly of the opinion that there will be a very substantial increase in the consumption. If, however, the price of nitrogen remains at the level of the present controlled price of ammonium sulphate, the demand is likely to be largely determined by factors such as the prices obtainable for agriculture produce.

"(Q) The committee is satisfied that synthetic processes can at the present time be operated in the United Kingdom upon a sound economic basis and that the undoubted advantages enjoyed by such methods will become more pronounced in the course of time as the result of constant efforts towards improvement.

"(R) The committee is emphatically of the opinion that the national interests demand the establishment forthwith of nitrogen fixation and allied processes upon a considerable manufacturing scale.

"(S) It appears that the question of overproduction, which was raised in evidence given before the committee, is hardly likely to constitute a serious factor in the postwar situation.

"(T) A minimum of perhaps 70 per cent of the world's total supplies of nitrate and ammonia nitrogen was utilized in agriculture prior to the war.

"(U) Combined nitrogen (as cyanamid or ammonium sulphate) can be obtained by synthetic processes at a cost, at the factory, which is less than half the market price of combined nitrogen from other sources, prewar conditions being taken as the basis in each case.

"(V) The world's demand for combined nitrogen appears to double every 10 years. The increased production during the war has not been more than the normal rate of increase during peace.

"(W) As far as the United Kingdom is concerned, nitrogen fixation and allied processes will constitute a new 'key' industry. The committee is of the opinion that the initiation and development of the industry will require the active support of the Government."

COMMENT BY THE COMMITTEE.

1. As an aid in the study of the foregoing quotations, it may be well at this point to explain that there are three processes which are used commercially in the fixation of atmospheric nitrogen. Whether or not one or another of these processes enjoys any particular advantages over the others depends altogether upon several factors that enter into the manufacturing of fixed nitrogen. From a practical and agricultural point of view the cost of the operation, and the consequent market price of the commodity, is always the determining factor, so far as the availability for farming uses is concerned. Then again, the power required necessarily enters into the consideration. That process which requires least power, other things being equal, will naturally be the most favored method of fixing nitrogen. Also the proximity of the plant to its sources of raw material, and their availability, will assuredly reflect themselves in the ultimate price.

The three processes referred to frequently by the nitrogen products committee are the arc, the Häber (pronounced Haber), and the cyanamid or lime-nitrogen.

The arc process enjoys the distinction of being simple in that it uses the electric arc to force a combination of nitrogen and oxygen, which combination is caught in water, and after treatment in an alkali produces, as a primary product, nitric acid. Air and water constitute the main raw materials in this process. The handicap of the arc process is that it requires such an expenditure of electrical power. Not more than 4 per cent of the electrical energy used is represented in the nitrogen secured. This makes the arc process almost indefensible except where water power to generate the electrical energy is superabundant. Norway is the only country to use this process commercially, which may be accounted for by a study of her immense water-power resources.

The Häber process is used mainly in Germany and was her principal reliance for nitrogen during the war. This process is based on securing a highly precise mixture of hydrogen and nitrogen, under great pressure and while subjected to terrific heat. If the mixture of these gases is properly maintained the heat and the pressure are easily controlled and the resulting product of fixed nitrogen is secured. But, however, if too much of one gas is admitted or too little of the other, the chemical reaction is highly dangerous in that an explosion occurs. A war incident may be cited in which the American war planes were bombing a German plant of the Häber variety, and although none of the bombs hit the mark the plant was destroyed on account of the workmen fleeing for safety from the bombs and so leaving the gases uncontrolled for half an hour. The principal advantage of this process over any other known process is the small amount of electrical energy required. Approximately only one-fourth the energy is used in this process that is consumed in the lime-nitrogen method, and only about one-sixteenth as much as the arc process demands. Nitrate plant No. 1 was built to use the Häber process, but has never produced fixed nitrogen commercially. The committee desires to suggest, though, that if the Germans can do it, so can we; and to suggest further that the difficulties encountered in the successful application of the well-known chemical laws concerned in this process, are mostly of a mechanical nature now, and we may confidently expect such difficulties to be overcome by the ingenuity of our chemists and mechanics working together.

The cyanamid or lime-nitrogen process has been explained at some length in a preceding division of this report. Suffice it to say that this process, all things considered, is meeting with the most favor all over the world, and is the one used in nitrate plant No. 2.

2. The report of the nitrogen products committee of the British Government accentuates the following conclusions which have been arrived at in this country relative to a development of the nitrogen-fixing industry:

"(a) That such an industry would have the effect of reducing prices on the nitrogen content of fertilizers.

"(b) That such an industry would have the controlling influence in the determination of market quotations on fertilizers.

"(c) That such an industry should receive the support of the Government.

"(d) That such an industry, at least with our present knowledge of other processes, should be based on the cyanamid, or lime-nitrogen process.

"(e) That the synthetic processes (arc, Häber, cyanamid) may reasonably be expected to produce combined nitrogen at approximately one-half the pre-war price.

"(f) That the establishment of such an industry, although expensive, might be expected to amortize the original capital cost in a few years by the saving effected in market prices on nitrogen.

"(g) That agriculture will use nitrogenous fertilizers in proportions which increase or decrease as the price of nitrogen fluctuates.

"(h) That agriculture is the biggest user of nitrogen and therefore is primarily concerned in its production at a price which will permit of its use.

"(i) That the Chilean nitrate industry will continue as a factor in the fertilizer market indefinitely, but that we should place ourselves in position to be independent of foreign supplies, both in times of peace and war.

"(j) That a plant to manufacture fixed nitrogen can be operated on an economically sound basis.

"(k) That the nitrogen industry is not of concern only to one group—as the military, the industrial, the agricultural—nor is it of interest to merely one section of our country. But it is a national problem which challenges the interest of all citizens who have regard for public safety in time of war or who desire that soil conservation and food production be safeguarded in order that agriculture and industry may prosper.

"(l) That there is slight danger of an overproduction of nitrogen so long as the price factor is held constant and equitable."

VII. POWER.

Enough information has been offered in other portions of this report to show that any plant designed for the fixation of atmospheric nitrogen, which is to be placed on the competitive markets, must have readily and steadily available the cheapest form of power. In war times, when low cost of operation was not of prime importance, provided a higher cost expedited our activities, it was possible to contemplate the operation of such plants as nitrate plant No. 2 with power which did not qualify as being the least costly. Accordingly a giant steam plant was installed to run the plant during the interim between the completion of No. 2 and of the Wilson Dam, it being known that the power from the dam could not be available for perhaps three years after the plant began production. Nitrogen production by steam power is, of course, more costly than by water power, which is true of any other industry that can be hydroelectricified.

In peace times the successful and economical operation of nitrate plant No. 2 for the production of fertilizers depends almost wholly upon the completion of the hydroelectric plant in connection with the Wilson Dam. The whole proposition at Muscle Shoals revolves around the item of cheap power. Without this cheap power it is hardly possible to hope that the production of nitrogen will be secured at a figure low enough to materially affect the market price of fertilizers. All estimates, data, and reports from every country point significantly to hydroelectric power as being the determining factor in the manufacturing of atmospheric nitrogen. All other competitive factors, such as the supply of raw materials, their location with regard to the plant, the available market for the product, the chemical and mechanical difficulties, all take places of secondary importance when compared with the one indispensable factor, cheap power.

That there will be an abundance of water power at Muscle Shoals upon the completion of the Wilson Dam is evident when the salient facts connected therewith are considered. The dam, being 100 feet high, will maintain a normal head of 95 feet. The dam and power house are being constructed for the ultimate installation of 18 generating units, each consisting of a water turbine and generator capable of producing 30,000 or 36,000 horsepower. Seventeen of these units are expected to be ready for operation at all times, leaving one out for repairs. These 17 operating units will, therefore, have a total normal output of about 600,000 horsepower. The installation plans call for the immediate placing of only four of these units, which will be ample to operate nitrate plant No. 2, as they will produce 120,000 horsepower. It is worthy of note that the installation of only four units will allow much water to flow over the top of the dam unused during most of the year, whereas if 10 units were installed they could operate to full capacity on an average of half the time, which would justify their installation.

These statements are based on the known flow of the Tennessee River at Muscle Shoals during the period from 1895 to 1914 inclusive, with only one year not considered on account of incompleteness in the records. In all that time, 19 years, the lowest the river ever dropped would have produced 5,000 horsepower; but only 6 years of the 19 recorded show a flow at any time so small as to drop below the 108,000 horsepower required to operate nitrate plant No. 2. In these six years the time in which the flow was less than sufficient to produce this required horsepower amounted to 1.3 per cent of the total time. In these times of low flow the steam plant stands ready as auxiliary power, but to keep the power constant for the four units required to operate No. 2 the steam plant would have to be fired up only 1 day out of 60, on an average.

The records of flowage at Muscle Shoals show that for 9 months in the year there will be approximately 240,000 horsepower, for 7 months in the year 320,000 horsepower, for 5½ months in the year, 480,000 horsepower, and for 4 months in the year 600,000 horsepower, making an average of 300,000 horsepower for the whole year.

If we decide to install only the first four power units and be satisfied to make no use of the remaining power we must be content to see much water spill over the dam. If, however, we desire to harness the full force of the stream we will advocate the placing of the entire battery of 18 horsepower units even if it can not be used throughout all the year. These considerations have given rise to descriptive terms to define the amounts of power available at Muscle Shoals. All that power (approximately 100,000 H. P.) which can be depended upon from day to day, year in and out, as the average lowest power available, is known as primary horsepower. If for one day, or even for one week, as an extraordinary occurrence, the river should drop below this average lowest power line no recognition is given such occurrence in this definition. All other waterpower at Muscle Shoals, from the minimum of 100,000 horsepower to a maximum of 600,000 horsepower, is called secondary power.

As a maximum waterpower development at Muscle Shoals with 18 power units installed we have: One hundred thousand primary horsepower plus 500,000 secondary horsepower. It needs to be remembered that the primary power does not vary—it is constant—but the secondary power is quite variable.

There is a third power available at Muscle Shoals from the steam plant. This classifies neither as primary nor secondary power but should be considered altogether as auxiliary power. Its use should be to supplement the secondary power as occasion requires.

The immense reserves of secondary power available at Muscle Shoals, not to mention the primary power which is just about ample to operate No. 2 constantly, brings to our attention the necessity of finding a suitable market for such excess power. It may not reasonably be expected that such a market will develop instantly. The history of great hydroelectric plants has been that at first there has been an excess of power for the available market; but that soon the demand for power exceeded the capacity of the plants. So it will undoubtedly be at Muscle Shoals. It would be foolhardy in the extreme, no doubt, to expect at once handsome dividends on our governmental investment at Muscle Shoals other than that which comes to all citizens from a satisfactory supply of nitrogenous products.

It would be unfair though, to estimate the cost per horsepower of the Wilson Dam on any other basis other than one that contemplates the eventual use of all power classified above. Undoubtedly, either by direct location of factories or by transmission, all the power that the dam is capable of producing will be utilized. Therefore, taking the total estimated cost of the dam with its power equipment but without the navigation features (which will be found in detail in another division of this report) and dividing by the maximum power developed we have the following: Forty-five million five hundred thousand dollars divided by 600,000 equals \$75, cost of installing each horsepower if all power were used constantly.

Inasmuch, however, as the primary and secondary power do not stand at that high figure all the time, but maintain a mean average of about 300,000 horsepower, the following equation more nearly represents a fair estimate of installation costs per horsepower. Forty-five million five hundred thousand dollars divided by 300,000 equals \$150, cost of installing each horsepower, based on average power developed. It will be seen that the initial capital cost of 1 horsepower at Muscle Shoals compares favorably with the same power when bought in the form of a high-grade gasoline engine for use about the barn or in the shop. It is only fair to state, however, that other estimates as to the cost of the dam, exclusive of navigation features, and which are from dependable sources, reduce the figures above used by fully \$15,000,000. The estimate here used was made in 1919 at peak prices and is being adhered to as the highest possible cost of the dam.

Moreover, the cost of operation, per horsepower, after the installation is paid for is far less than that of any other kind of plant, not excepting the most economical steam plant. In this connection the great saving in coal that would be brought about should not be overlooked.

COMMENT BY THE COMMITTEE.

Recognizing that the power development at Muscle Shoals as represented by the Wilson Dam equals in importance, though not in expense, the building of nitrate plant No. 2; and fully realizing that No. 2 will be greatly handicapped until the dam is completed; and considering that the dam will meet its first

MUSCLE SHOALS PROPOSITIONS.

for the expense of building it in the operation of No. 2; your committee therefore, desires most candidly to state its thoughts on the connection between the two undertakings:

First of all, it is desirable that the Muscle Shoals project pay for itself on a reasonable capitalization.

Second in importance, no doubt, is the necessity for operating No. 2 in connection with the Wilson Dam.

Third, provision should be made for installing, at least the major part, of the power units that excess power would be available.

Fourth, the immediate installation of power units is placed then it may be suggested that the excess power be disposed of commercially but that the necessities of the nitrate plants for power be met fully by the power as sold.

Fifth, there will be enough excess power, however, to return a handsome profit to the Government.

Sixth, it must not be forgotten that the combined expenditures at Muscle Shoals and the Wilson Dam and nitrate plant No. 2 represent a citizens' investment in the Government. This investment will be of value to the citizens and consequently, all citizens should desire that the entire project be run on a business basis. The effort should be to make this government project of our Government 'pay out.' It can only be done by a business management of its affairs as will be explained in a later division of this report.

VIII. POSSIBILITIES.

In the consideration of nitrate plant No. 2 thus far in this report attention has been focused almost exclusively upon its capacity to produce nitrogenous compounds as lime-nitrogen, ammonium nitrate, and ammonium sulphate. It is possible the plant was built as a nitrogen-fixation establishment so that nitric acid and nitrates could be available for the manufacture of military explosives and for use in fertilizers. That in the erection of this great plant Congress had in mind its dual purpose—military and agricultural—is shown by the following quotation from section 124 of H. R. 12766 of the Sixty-fourth Congress:

The President of the United States is hereby authorized and empowered to make, or cause to be made, such investigation as in his judgment is necessary to determine the best, cheapest, and most available means for the production of nitrates and other products for munitions of war and useful in the manufacture of fertilizers and other useful products by water power or any other power as in his judgment the best and cheapest to use; and is also hereby authorized and empowered to designate for the exclusive use of the United States, in his judgment such means is best and cheapest, such site or sites, upon any navigable or nonnavigable river or rivers or upon the public lands, as in his opinion will be necessary for carrying out the purposes of this act; and is further authorized to construct, maintain, and operate, at or on any site or sites so designated, dams, locks, improvements to navigation, power houses, and other plants and equipment or other means than water power as in his judgment is the best and cheapest, necessary or convenient for the generation of electrical or other power and for the production of nitrates or other products needed for munitions of war and useful in the manufacture of fertilizers and other useful products."

(A) AMMONIUM PHOSPHATE.

A great development that can be hoped for at nitrate plant No. 2, is the obtaining of available phosphoric compounds from phosphate rock by treating it in the electrical furnace. It will be remembered that limestone and coke are fused into carbide by means of intense heat in the electric furnaces, and this fusion constitutes the first step in the fixation of atmospheric nitrogen. Later steps produce lime-nitrogen, and from it is produced ammonia gas. A gas is of no value as a fertilizer as it can not be placed in the soil; it must be absorbed in some liquid to make it available, and later reduced to a solid form of a crystalline nature. In No. 2 this ammonia gas is absorbed either in nitric acid to produce ammonium nitrate, or in sulphuric acid to produce ammonium sulphate. In fact there are several acids that will absorb this ammonia gas. To cite only one more, it may be stated that hydroelectric acid can be used to form ammonium chloride, which is good for fertilizer use. In nitrate

plant No. 2, if we desire to go beyond the lime-nitrogen or cyanamid product--which is of itself a good fertilizer but with limitations--and produce the usual fertilizer commodities which are generally used, we have to reduce our lime nitrogen to a gas, ammonia, and use that as the base of our further developments. This ammonia gas contains practically all the nitrogen that the lime nitrogen carried, but it, in its turn, has to have its nitrogen fixed or caught as above stated, in liquid form first, through the use of an acid, and then solidified by boiling.

It is, as above set forth, largely immaterial to this ammonia gas which acid is used to absorb or catch it. Heretofore in this report slight consideration has been given any fertilizer question except the purely nitrogenous one. If, however, other acids can be produced in No. 2 which will absorb this ammonia gas, and if these other acids of themselves have fertilizing values, then it will be well to make such slight changes and additions in the equipment as will enable us to produce more than one fertilizer constituent.

By using the same electric furnaces that have been previously described, and by filling them with phosphate rock, coke, and sand, instead of lime rock and coke, it is possible to produce a very pure form of phosphoric acid which carries 45 per cent of available phosphates. Here again we see the desirability of the location of No. 2 as some of our largest phosphate beds lie in Tennessee not far from Muscle Shoals. This plan has never been tried out in No. 2, and in fact some alterations would need to be made in the equipment; but there has been a six months' test made of this process by the United States Department of Agriculture on a commercial scale. The result of this test, financially, was that on account of high-priced electric power the product of the test cost more than producing acid phosphate by the old and wasteful method of treating the raw phosphate rock to a bath of sulphuric acid. The conclusion, however, seems to be that with hydroelectric power as cheaply as it can be had at Muscle Shoals the process of making phosphoric acid is entirely feasible and practicable.

In the usual way which is now followed in the production of acid phosphate great use is made of sulphuric acid which has no fertilizing value whatever but really has an acidulous effect of the soil. This is also true of the use of sulphuric acid in No. 2 as an absorbent for the ammonia gas to make ammonium sulphate. In both instances we are carrying something along, sulphuric acid, which has no fertilizing value.

A substitution of phosphoric acid, which carries a very necessary fertilizer ingredient, for the other acids above mentioned, as the absorbent for the ammonia gas, would result in giving us ammonium phosphate, a fertilizer carrying two very valuable soil foods--nitrogen and phosphate. This ammonium phosphate differs from the ammonium nitrate and ammonium sulphate previously described as products of No. 2, in that it carries two fertilizers in one compound instead of one fertilizer in two compounds.

(B) POTASSIUM PHOSPHATE.

It will be seen from the foregoing paragraphs that at Muscle Shoals we have assuredly a plant to produce nitrogen, and also we have the same plant available as a possible producer of phosphate. This gives us two of the three ingredients that usually go to make up the mixed fertilizers which are sold to-day.

In close proximity to the plant at Muscle Shoals there lie great beds of potash shales, many of which contain 4 per cent of potash. It has been experimentally ascertained that the substitution of these potash shales for the sand which is used in the production of phosphoric acid in the electric furnaces does not materially interfere with the chemical reaction that produces phosphoric acid, but does produce at the same time a fusion or union of the potash in the shale with the phosphoric acid. This gives us potassium phosphate with phosphoric acid carrying the potash.

The production of phosphoric acid in making potassium phosphate is in excess of the amount needed to absorb the potash and can be united with ammonia, giving ammonium phosphate.

It will be seen, therefore, that in the one plant there is a great possibility for the development of a complete fertilizer output by absorbing the ammonia gas of the lime-nitrogen process and the potash from the shales in phosphoric acid which is of itself a carrier of fertilizer values and then crystallizing the compounds by the application of heat, much like sugar is secured from the juice of the beet.

(C) OXYGEN.

In one of the buildings at nitrate plant No. 2 the air is separated into two component gases, nitrogen and oxygen. The nitrogen is used in making lime-nitrogen, but the oxygen is released and returns to the atmosphere. Inasmuch as this gas is used extensively in factories and shops for welding and similar uses, eventually we may expect that it will be retained and disposed of commercially.

COMMENT BY THE COMMITTEE.

Although the making of phosphate and potash fertilizers at nitrate plant No. 2 are herein classified as possibilities, it must be conceded by all that not much remains to be done in an experimental way as most, if not all, the chemical problems have been solved. Their classification as possibilities rather than actualities is accounted for by the fact that No. 2 was built to make lime-nitrogen and other forms of nitrogenous products, and certain additions to the equipment and perhaps some new construction would be necessary if other fertilizers were made. Whether or not such expenditures will be approved remains in doubt.

Farmers should realize, though, that the plant is abundantly justified if it produces nothing more than nitrogenous products.

That there may be a clearer understanding of the importance of the entire Muscle Shoals project, and especially that the significance of its phosphate development may be fully realized, your committee submits herewith some quotations from an article written in July, 1919, by Dr. Caro, who is recognized in Germany as the leading authority on nitrogen fixation. Dr. Caro was minister of war munitions for Germany at one time.

"Far more dangerous (to the German nitrogen industry) than the competition of Chilean nitrate appears to be the possibility of competition with artificially fixed nitrogenous fertilizers produced in foreign countries.

"The largest of these foreign lime-nitrogen plants is located in the United States in Alabama. Its situation is most excellent. It is connected with the ocean by means of the Tennessee River, which has been made navigable. It is situated at a source of almost constant water power amounting to 400,000 horsepower, and is right in the midst of a locality where all the raw materials of the lime-nitrogen (cyanamid) industry are present in the highest purity and at the very lowest prices.

"Nearby are the inexhaustible deposits of high per cent phosphate rock. The possibility, therefore, exists of producing cheaply ammonium phosphate containing roughly 45 per cent of water soluble phosphoric acid and 20 per cent nitrogen.

"To be sure the United States is in a position to use right there the nitrogen thus produced, amounting to about 130,000 tons per year—nevertheless it will be possible to ship it long distances to places where its phosphoric acid content will be of importance, and hence it will be sure to offer very strong competition to the German fixed nitrogen industry."

IX. CONSERVATION.

Nitrate plant No. 1, nitrate plant No. 2, and the Wilson Dam together constitute what is probably the greatest single conservation activity of our Government. This entire project should be viewed in the same light as is an irrigation project, a forest reclamation activity, or a levee and drainage problem. Its great purpose, in peace times, is to assist in maintaining our soil fertility, and, consequently, in the adequate production of food for our increasing millions.

As all other conservation projects are of general interest to all the citizens so is this undertaking at Muscle Shoals. Farmers and military men need not assume to themselves all the benefits accruing from an operation of this project. In times of war it will be predominately military in type; in times of peace it will be almost wholly agricultural in character; but at all times it will be a service to all our people, to protect and to feed.

When the rapid depletion of our soil resources, especially the nitrogen content, is considered we can not view with complacency the ultimate condition toward which we are advancing agriculturally. An average crop of corn takes from the soil about 3,000,000 pounds of nitrogen. A cotton crop of 15,000,000 b. b. depletes the soil to the extent of one-half billion pounds of nitrogen. Other crops take lesser amounts but the grand total will not fall below 6,000,000,000 pounds. Of course, the alchemy of nature is working all the time in a slow

replacing this lost nitrogen but the process is wholly inadequate to keep pace with the requirements of our growing crops.

Man is doing a great deal to replace what his crops take from the soil in the form of nitrogen by growing legumes, by spreading manures, and by using fertilizers. But his efforts do not more than half restore the nitrogen that the soil loses yearly. More nitrogenous fertilizers at a cheaper price would assist wonderfully in checking this soil depletion.

COMMENT BY THE COMMITTEE.

In 1920 the average yield of red clover hay was, for the whole nation, 1.46 tons per acre. This hay carried enough nitrogen to yield 0.029 tons per acre or 58 pounds. If enough of this clover had been turned under by the plow so that all the nitrogen would have been given to the soil, it would have taken approximately 4,000,000 acres to equal the annual output of nitrate plant No. 2. Since, however, the sacrifice of all this clover hay, at the price secured on an average for such a product, would represent a soil fertility investment of approximately \$60,000,000, it can be seen how significant our soil conservation problems are becoming.

X. RECOMMENDATIONS.

In consideration of all the foregoing information; after personally inspecting nitrate plant No. 1, nitrate plant No. 2, the Wilson Dam, the flood area above the dam, and the construction equipment; after advising with engineers and chemists on the sites of the project; and after submitting the items of cost and estimates herein contained to other engineers and chemists of national reputation; your committee unanimously makes two specific recommendations, as follows:

(a) That the Wilson Dam be completed by the Government without undue delay.

(b) That since the Government now has the rights, under contract, to produce nitrates by nit-fixation processes, the nitrate plants, No. 1 and No. 2, shall be placed under the direction of a governmentally owned corporation, which may, at its discretion, operate the plants or maintain them ready for operation, but with strict regulations relative to prices to be secured for commodities in which products of these plants are used.

COMMENT BY THE COMMITTEE.

In connection with the recommendations above set out your committee offer this additional information:

Relative to recommendation (a):

(a) That the work on the Wilson Dam is now only sufficient for maintenance.

(b) That such maintenance, or stand-by expense, is too great to be long continued.

(c) That work can not be resumed on the Wilson Dam until Congress makes the necessary appropriation, which will be approximately \$10,000,000.

(d) That the completion of the Wilson Dam is indispensable to a successful and economical operation of the nitrate plants.

(e) That since the Federal Government has invested millions of dollars at Muscle Shoals, it is nothing but good business to complete the investment by finishing the Wilson Dam so that the entire undertaking may begin to return service to the people and interest to the Treasury.

(f) That if work is too long suspended on the Wilson Dam, much of the temporary preparations for construction will not then be available but will have to be again performed.

Relative to recommendation (b):

(a) That nitrate plants No. 1 and No. 2 can be operated by the Federal Government as the lessee of patent rights covering the processes used. There is herewith submitted a quotation from the contract which has been signed by the firm owning the patents and the Federal Government:

"The licensor (the firm owning the patent rights) hereby gives and grants to the licensee (the Federal Government) in addition for use and application exclusively by the licensee in the operation of the aforesaid plants, the rights, license, and privilege to use any and all of the patents, processes, methods,

and designs embraced in the license hereinbefore granted to the licensee by article 1 hereof, from and after the 1st day of June, 1921, or the date upon which the United States shall cease to be in the present war (whichever date shall last occur) and until the expiration of the United States patents covering the same, upon the following terms, to-wit:

(b) That the Federal Government must pay a royalty to the firms owning the patent rights on the processes for every pound of nitrogen content that is manufactured in the plants until the patents expire, which will be in most instances in 1931. Continuing the above quotation:

"The licensee shall pay monthly to the licensor for such additional license under this article a royalty, unless and until changed by the arbitration herein-after provided, of 1½ cents per pound of nitrogen content in any and all products manufactured by the licensee at each and every of said plants under and by the use of any of the patents, processes, methods, or designs embraced in the said additional license."

(Then follows provision for arbitration of royalty fees if either party to the contract is dissatisfied.)

(c) That the nitrate plants can not be leased by the Federal Government to any private firm, unless indeed it be the ones that own the patents on the processes used.

"The licensor, for use and application exclusively by the United States Government or the aforesaid agent (the representative of the Ordnance Department who signed the contract for the Government) at such plants, has given, granted, assigned, and does hereby give, grant, and assign to the licensee the right, license, and privilege to use any and all the processes, methods and designs covered by letters patent of the United States and involved in the manufacture of lime nitrogen (calcium cyanamid), its conversion to ammonia gas and the oxidation of the ammonia to weak nitric acid, etc."

(d) That, therefore, your committee could see only three alternatives relative to the disposition of the plants, as follows:

(1) To lease them for operation; which leasing, under the contract, would necessarily be to the firms owning the patent rights, and would give us, as a primary conclusion, that no appreciable lowering of fertilizer prices would ensue.

(2) To keep the plants intact on a yearly stand-by or maintenance expense, which would be great, ready to produce nitrogen in the event of another war, but suffering all the time an unavoidable deterioration of the present equipment and of its adaptability to the development of new processes, which might reasonably be expected to render us helpless, so far as nitrogen fixation is concerned, in comparatively a few years.

(3) To operate the plants under some sort of governmental machinery with would guarantee a business-like administration of their affairs.

(e) That your committee chose the third method outlined above and wishes at this point to outline briefly its ideas as to the administration of the plants.

Your committee thinks it is a universal conclusion that such establishments should not be dependent upon annual appropriations from Congress but that they should be thoroughly equipped, supplied with the necessary operating capital in the shape of a loan or otherwise, and then directed by a board which should be left free to operate the plants on a business basis.

This board should be the legal head of a corporation, the stock of which is all held by the Treasury of the United States. The members of the board should represent various occupations of our people, but each member should be a person of proven business ability. It is preferred by your committee that the members of the board be appointed by the President of the United States similar to the appointment of other Federal boards and commissions. After their appointment the members of this board should be left free, except with such limitations as are legally necessary, to direct the affairs of the entire Muscle Shoals project as a corporate entity.

The powers of this corporation for which this board acts should be, in the opinion of your committee, generally as follows:

(1) To own and operate the entire Muscle Shoals project;

(2) To sell to the United States, to producers, and to others the products manufactured;

(3) To regulate the prices obtained for any mixtures in which products of these plants are used;

(4) To purchase, lease, or acquire patents, both domestic and foreign, of improved processes;

(5) To operate the entire proposition as a business corporation charging prices sufficient to pay a reasonable dividend on a reasonably estimated capital cost.

(7) That your committee does not consider the Muscle Shoals undertaking as it now stands as predominately either an engineering or a chemical problem, as those tasks have largely been performed. It is now, rather, a business problem which is of concern to the people in all parts of the Nation.

(9) That your committee does not at all favor selling the entire Muscle Shoals project, as has been done with other great war-munition plants, some of which cost approximately as much as Muscle Shoals and were sacrificed, on time sales, at prices representing about 5 per cent of their construction costs.

(h) That after the Government has operated these plants for some time and has acquired, by purchase or otherwise, patent rights on the processes used therein, and has demonstrated fully that the research and practical features justify a continuance of their operation, the matter of leasing or selling them to farmers or others for continued operation would then be of pressing importance, as such leasing or selling could be conducted on a competitive basis which is now impossible since the Government is only the licensee of patent rights that are owned by others.

XI. CONCLUSION.

It is hoped that the presentation of the information herein contained will serve to confirm you in the thought that the action of the American Farm Bureau Federation in months past relative to the Muscle Shoals project has been a correct action, and should be continued with the guidance of the two recommendations above made.

There is an imperative demand at this time for the initiation of legislation in Congress which will make it possible to complete the Wilson Dam and to operate the nitrate plants. It is urgently requested that you signify your approval of the recommendations of the committee in order that the president of the American Farm Bureau Federation, the legislative director, and the legislative committee may feel authorized to proceed.

Respectfully submitted.

W. G. JAMISON,

President Colorado Farm Bureau Federation.

JOHN G. BROWN,

President Indiana Federation of Farmers' Associations.

CHESTER H. GRAY,

President Missouri Farm Bureau Federation.

WASHINGTON, D. C., May 31, 1921.

Mr. SILVER. The farmer finds himself at this time in a most unhappy situation from being compelled to buy in markets that have been boosted in one way or another, with one trade practice or another. It may be by an excessive protective tariff, it may be by an unfair freight rate, or it may be by private selling agreements, secret processes, formulas, or otherwise, but these different practices have been built up and enter into what we call in our production high cost factors.

I can illustrate one of those factors with the Pittsburgh plus case. Pittsburgh plus provides—it is purely an agreement with no law for it, but an agreement among interested parties—that they sell all steel on the Pittsburgh base price plus freight. If steel is produced at Muscle Shoals, and all the materials are there to-day, just as they are at Birmingham, a little further down the river it would vacate this Pittsburgh plus case. This Pittsburgh plus case is being contested before the Federal Trade Commission as well as before the Interstate Commerce Commission, and \$7.60 is paid in phantom freights on every ton of steel that is resold on the Pittsburgh base used at Chicago, there being the result of a handicap between Pittsburgh and Chicago.

The CHAIRMAN. What do you mean by "phantom freights"?

Mr. SILVER. I mean that is freights that are paid under this Pittsburgh plus agreement on goods never shipped.

The CHAIRMAN. To whom is that paid?

Mr. SILVER. That is paid to the manufacturers, either the producer or the manufacturer of steel. Steel is sold through a trade agreement on what is known as the Pittsburgh plus base. That means that if I buy steel at Gary, Ind., and I use this figuratively, because any other place would apply as well,

although I have paid no freight except from Gary, which is just a suburb of Chicago, into Chicago, if I buy that steel, I pay the Pittsburgh price plus the freight from Pittsburgh to Chicago. That is a phantom freight added to the cost of the steel when produced, and after it has been produced and sold to a manufacturer he adds on his 20 per cent to this phantom freight as a manufacturing cost which makes it \$8.40, and that is all phantom but is very real to the person who pays it.

The CHAIRMAN. In other words, he makes a profit of 20 per cent on the freight that he is compelled to pay?

Mr. SILVER. That he does not pay but is included in the agreement.

The CHAIRMAN. Do they not charge the commodity with that freight at all?

Mr. SILVER. If the steel were produced in Pittsburgh and shipped to Chicago, it is a legitimate charge, because they pay the freight. If it is produced in Chicago, I might say, because Gary is a suburb of Chicago, if it is produced in Chicago they pay that freight under this selling game just the same. It is added to the cost. So that \$7.60 a ton is added to the selling price of the steel and then 20 per cent is added on that by the manufacturers when we go to buy a blinder or any other part of our equipment made from steel. That is one of the ways of building what we call high cost factors.

If steel is produced at Muscle Shoals it vacates that as one of the high-cost factors and is one of the things that makes a strong appeal in the development of a natural resource that Henry Ford be given the opportunity to develop that plant, because we believe he would not enter into any such trade agreements. We feel we would have another base, and that would vacate the Pittsburgh plus base generally.

The CHAIRMAN. On this phantom freight proposition, the consumer or the buyer of the steel is compelled to pay for something that nobody has got.

Mr. SILVER. That nobody has rendered any service for.

The CHAIRMAN. And ultimately—

Mr. SILVER (interposing). And it is a great sum, approximating some \$70,000,000 a year. Why, in the Federal Reserve Bank building in Chicago alone there was \$60,000 of phantom freight and plus costs.

Mr. CRAGO. It is an attempt to make up to the manufacturer who is not advantageously located like the man in the Pittsburgh district the difference in cost. That is what it is done for, is it not?

Mr. SILVER. It started out in that way, but it has got to be just one system of building up what we call high-cost factors.

Mr. PARKER. I have not seen that agreement. Have you got it here?

Mr. SILVER. I beg your pardon.

Mr. PARKER. Have you got that Pittsburg base agreement here? The point of it, as I understand it, is all steel is paid for as if it were produced in Chicago?

Mr. SILVER. No; in Pittsburgh.

Mr. PARKER. I mean in Pittsburgh.

Mr. SILVER. That is right.

Mr. CRAGO. And, of course, the great quantity is produced at Pittsburgh and pays this legitimate freight, and this just helps the others to get the same advantages, does it not?

Mr. SILVER. If the cost prices were the same at all the places and it was sold where it was produced, but Gary enjoys the advantage of making cheaper steel than Pittsburgh does and so does Birmingham, and therefore in addition to the fact they produce cheaper steel they not only sell on Pittsburgh base but sell plus the freight.

Mr. KEARNS. What makes you think that Mr. Ford would not adopt the same tactics that other manufacturers do? What is in his record to make you think that?

Mr. SILVER. His life business; I am thinking now of the automobile business.

Mr. KEARNS. Does he not sell the most expensive machine to operate that was ever made?

Mr. SILVER. I shall not discuss with you that point, but with his viewpoint in industry he has produced a car that has enabled the average farmer to own a car when but for Mr. Ford's viewpoint in industry many farmers would never have been able to have ridden in an automobile, and they would still be using the horse and wagon.

Mr. KEARNS. Yes; he produces a cheap car, but what makes you believe that if he should get this contract or this lease at Muscle Shoals he would produce steel or any other manufactured commodity and would not take advantage of prices the same as any other business man?

Mr. SILVER. His viewpoint in producing at a low cost and selling in volume. He would fight just as he fought in the Selden patent case. The Selden patent was a method of building high-cost factors. He contested it successfully and sold his cars cheaper.

The CHAIRMAN. The chairman will not ask any more questions, and we will all pass around the table as usual. I wanted to get a little enlightenment about this matter when you spoke of it, because I knew nothing of the situation, but I will not interrupt further. Just make your own statement in your own way.

Mr. McKENZIE. Mr. Chairman, as one member of the committee, I think it is entirely within the province of the chairman of the committee as the witness goes along to interject such questions as he sees fit and proper, and I think all of the members of the committee will join me in extending to our chairman that courtesy.

Mr. QUIN. I think that myself. The chairman can frequently help the witness to develop the case.

Mr. FIELDS. I have never understood the rule that was adopted for the guidance of the committee in conducting these hearings to apply to the chairman in straightening out some statement that is made, and I think that the chairman can be of a great deal of assistance to the committee in that way.

The CHAIRMAN. That is what I thought, too.

Mr. FIELDS. I am perfectly willing as a member of the committee to observe the rule as long as it is observed by other members, and I think the rule should not apply to the chairman.

The CHAIRMAN. Of course, what I was trying to get from the witness was an explanation of this term, which was new to us and which we have not heard of before to-day.

Mr. FIELDS. It was very proper, and the chairman rendered a service to the committee, as he has upon a number of other occasions; and I will add, in this connection, Mr. Chairman, that my complaint the other morning, when I stated I had not been the first to violate the rule, was not directed at the chairman but at other members of the committee.

The CHAIRMAN. As long as we have agreed among ourselves to ask questions in rotation, we had better observe the rule and we will get along all right.

Mr. SILVER. However, I would consider it a favor, Mr. Chairman, if at any time I am not making myself understood that the chairman would interrogate me so that I may be clearly understood.

Mr. WRIGHT. I think, Mr. Chairman, it is the unanimous desire of the committee that the chairman ask questions as he chooses; and, to set that matter at rest, I make a motion to that effect.

(The motion, being duly seconded, prevailed unanimously.)

Mr. KEARNS. I am in hearty sympathy with that motion, and I hope my questions have not provoked all this discussion.

The CHAIRMAN. Oh, no. Will you kindly proceed, Mr. Silver?

Mr. SILVER. Along with that illustration I could give others; but I shall not do so, because I think you understand my thought.

The development of water power, to the farmer mind, is one of the ways—and a very material way—of lessening these cost factors if it is developed on the right and proper plan. Our belief in that is evidenced by one of the resolutions I read to you, and also by a letter which I wrote to Secretary Weeks some weeks since, which reads as follows:

JANUARY 9, 1922.

HON. JOHN W. WEEKS,
Secretary of War, Washington, D. C.

MY DEAR MR. SECRETARY: In turning over in my mind our conference on Mr. Ford's proposal to take over the Muscle Shoals development, and considering the various phases of the situation, I realize that the most serious difficulty appears to be the question of securing an appropriation at this time of heavy expenditure.

In searching for a solution it has occurred to me that an authorization for a Muscle Shoals bond issue of \$40,000,000 would remove the necessity for an appropriation. I am confident that under present conditions such a bond issue could be floated at 4 per cent. The interest payments of Mr. Ford amounting to \$1,680,000 annually, would pay 4 per cent interest on \$42,000,000 of bonds. He provides an amortization fund through which the bonds would be retired at the end of the 100-year period. It would be my thought to issue the bonds for 50 years, at which time the sinking fund would have accumulated to the point where a reissue might be floated at a lower rate of interest. By this means the Government would secure the development of this power with no

additional appropriation and have amortized nearly one-half of the present war-time expenditure of \$17,000,000 on the dam, since the amortization fund will, in addition to retiring the bond issue of \$40,000,000, retire \$8,000,000 additional.

Should this suggestion meet with your approval we shall be glad to cooperate with you in securing the adoption of this plan of financing the development.

Very truly, yours,

AMERICAN FARM BUREAU FEDERATION,
GRAY SILVER, *Washington Representative.*

If the waterways of this country are developed on a basis that permits you to amortize out the cost of the investment, you have electric current on a very much less base than any now produced. In other words, if you, and I am thinking of your committee and Congress, authorize, in accepting Mr. Ford's tender, a bond issue for the needed amount, as much as \$40,000,000, and these payments of Mr. Ford are allowed to go as proposed to amortize out the cost of the dam, that current would, on one of these days, be on a basis of maintenance and depreciation, and in that way you would have less manufacturing cost.

I gave you an illustration of steel, and the same principle will apply to manufacturing cotton, to manufacturing farm equipment and machinery, and in all the economic phases of our life. I am thinking of our farm life, but it applies just the same to other phases of our national life; and in addition to that, it would make a cheap current that could be used on the farm. The farmers of this country, where they carry their water from the foot of the hill, as I have done so many times, where they have to bend over the washtub and wash their clothing, where they have to drive their cattle down the lane to water, opening gates, etc., can all be done by electric power, and many more things other than I have enumerated, when it is produced on a basis that is cheap enough so that the production of foodstuffs and raw materials for clothing will pay the bill.

Any time that the economics of the situation are right, the farm homes will be much more comfortable homes. In addition to the things I have mentioned, they will have labor-saving devices and comfort-making equipment, and that will stop, in a measure, this movement from the farm to the town, for the country people will have the opportunity to have in their homes the same kind of labor-saving devices and comfort-making equipment that are found in the city homes, and they should be allowed to have them.

Here is a natural resource, and here is a method of developing it that will give it on a basis they can use it, and we most earnestly appeal to Congress that they do the thing that will enable us to avail ourselves of the results of this natural resource with a proper method of development.

I am now speaking particularly of Muscle Shoals, and my mind drifts to people who may make other tenders or who are objecting to it. Why pick on Mr. Ford at Muscle Shoals? There are many, many other water-power sites, and if the Alabama Power Co., or somebody else, wants to develop water power, why not just move over here on some other river, or at some other point in that river, and develop it? Why protest against the development of Muscle Shoals, if you are unwilling to develop water power? It is just arguing against the law of economics, and you are not going to stop water-power development, and if you want to develop water power, why bother with this situation? Here is a man who is willing to develop this water power, and is willing to go on and do the needed thing, so that we insist and urge that you give him the opportunity, and if somebody else wants another opportunity, why, give him that opportunity also.

Now, in reference to the less-cost factors, I will speak on another phase, namely, railroad freight, the thing that has to do very much with the farmer's life. There is enough of undeveloped water power and more to operate the railways of the Nation. We are suffering under a burden of excessively high freights, and if those railways could be electrified, we would have many economies that would make the cheapest freights we have ever had, if the power is developed on the plan I mentioned, amortize out the cost and put the current down on the basic cost of maintenance and depreciation.

This would not change the cars we have to-day. It would necessitate the changing of the steam locomotives for an electric motor and the wiring and machinery, etc., to run it, or a third rail or whatever they saw fit to use, but it is not such a staggering thought from the viewpoint of the investment, for

we would have saved a great amount of money in equipment that would otherwise be necessary to be expended. For instance, the average movement of freight cars is something like 7 miles a day, where they are moved by steam. Where they are moved by electric power, it is something like 14 miles a day. The same equipment speeding up twice as fast, barring the time it stops for loading and unloading, would move twice the freight. This means you do not have to go on building freight cars in the same proportion as you otherwise would, for you get a greater utility out of the cars that are now necessary. The money that would go into new freight equipment would very properly go into the development of water powers.

Then another thought, as illustrated out here in West Virginia, going from Bluefield up to Roanoke, where they have an unusually steep hill to pull, with the steam engines—trains were always broken down on this hill. The cars would pull apart and the engines would puff and blow and would pull the trains apart and the railroad had to lay sidings around this hill so that when these freight trains were broken down the passenger trains could operate. Seven years ago that line was electrified, and in the seven years it is reported that not a single drawbar head has been pulled. In other words, the trains hauled with the new method of power have gone up with a steady pull and have pulled the same equipment exactly that used to break down and have pulled it up over this hill and gone on their way without delay, and that has become so uniform and general that they have taken out these slide switches that they formerly had to have to let the passenger trains around when they were pulled by steam engine.

This means also that the equipment wears longer and you do not have the repairs on it. It also, in a great measure, makes a happy situation as to the terminals. You do run with an electric motor down to every station or every division and have a lot of hostlers to take your steam horse out and put him in a stable and blanket him and rub him down. These electric motors run on and stand a more continuous pull and run.

I am reading now from a report on the advantages of this superpower system, and I will read this, as it is just a short clause:

"The reserves of line and machinery required for joint operation will be much less than the aggregate of the separate reserves required for individual operation. The great waste involved in the maintenance of separate reserves of motive power as prepared by the operating statistics of the roads, quoted elsewhere, show that the average freight locomotive in this territory is in productive service only 3,250 hours out of 8,760 hours in a year."

That is a mighty small part of the year.

"And the average passenger locomotive only 2,630. With joint electrical operation and, consequently, unification of type of motive power, there would be a striking improvement. The steam locomotive runs 8 hours a day; the electric locomotive, 20 hours a day."

That illustrates the additional work you would get out of your electric horse to pull your train instead of your steam horse to pull your train. You can use the electric horse when you have abundance of cheap power and get cheap freight rates, and as the farmer pays four-sevenths of the freight rates in this country he is very vitally interested in any development that will help to bring that about.

Now, all of this is illustrative of the fact that agriculture to live and be prosperous must have less cost factors, and these illustrations are all made to show that this is a practical method of securing for agriculture and for the Nation less cost factors for their business, and when it is developed for their business it is not for any class or a special favor, because if we have cheap freights, every other group and class have cheap freights, and if we have cheaper steel, every other class has it, and if we have cheaper fertilizer, it produces corn and wheat and cotton and the things that are essential not only to our welfare but to our very existence, on a basis that we can afford to meet and compete in the world's markets.

As it is to-day, to give another illustration, from Norway and Sweden they are taking nitrates from the air and bringing them around to the coast of California, your home State, Mr. Chairman, and selling that product in competition with the Chilean nitrate, a natural product produced just below there, because they have built up their cost factors on that fertilizer until you can manufacture it from the air and transport it that great distance and sell it for the orchards of your home State at less cost than you can buy it from Chile.

We are urging this nitrate development or this fertilizer development, and as we look at this proposition we usually use the term commercial plant food.

If you stop a minute and think, when I touch that point, of the great quantities of foodstuffs and raw materials for clothing that are taken from our soil each year, our corn, our wheat, and cotton, and all the other things that enter into it—by far the largest part of it goes to the cities for consumption and export, and that is taking just that much of the available plant food from our soil, thereby impoverishing it that much, because when it goes to the city and goes down the sewer it does not come back to the farm any more. The soil is robbed of that much, and we will become a desert in time if we continue taking plant food from the soil and not replenishing it. The great place to get the nitrates is from the air. There are other fertilizer materials available at this particular point, and while this plant is never going to produce all the fertilizer we want it will be a marker in the development of supplies to replace this great amount of plant food taken from the soil in the crops we grow and which must be replaced if we are to have a prosperous nation.

We can not go on checking on the soil any more than you can go on checking on the bank. Your bank account will come to an end if you do not put something in there to keep it in good shape, and if we go on checking on the soil we come to the end just the same.

Now, just as a reminder, I will speak of what was said here the other day, and I am using cost figures from Dr. Whitney, page 89, hearings of the Senate committee on S. 3390:

"The estimate of the cost of producing phosphoric acid in the electric furnace shows a cost of \$29.85 per ton. Power is figured at \$3 per horsepower and amounts to \$5.28 per ton. If you figure the power at \$15 per horsepower, it would cost \$26.40 per ton for power alone."

I just give that as one of the illustrations of how we must have cheap power to produce cheap commercial plant food if we are to be enabled to buy commercial plant food at the sale price of the product which it produces.

From cost figures, page 95 of the same hearing:

"Using steam power at 4 mills per kilowatt hour, the cost of cyanamide is \$31.10. With water-power cost at three-fourths of a mill the cost is \$21.97."

That means a saving right there of about 35 per cent with the cheaper power.

As another illustration of the fact that we are not short of water power, it has been estimated that the undeveloped water powers amount to something like 52,589,500 horsepower. If all the existing railways of the country were electrified, they would only consume about 14,000,000 horsepower. So we would not absorb all our undeveloped water power if we electrified all the railroads. Of course I realize that that can not be done immediately, but there must be a starting place, and we think this is a good time to start; not that we are going to run all the railways from Muscle Shoals, but the same kind of development that develops Muscle Shoals economically and on a less-cost factor basis would develop these other water powers.

Now, when a farmer goes out to buy fertilizer, although there are several companies and many agencies, he gets the same price in the same territory no matter what agent or what company he approaches. He may not be able to prove a working agreement and a trust, as we call it, that makes high prices, but if you were a farmer and went from agent to agent and from place to place, you would be thoroughly convinced that there was a working agreement that the farmer can not get through when he buys commercial plant food.

We believe in this case just the same as we believe in the Pittsburgh plus case, that if Mr. Ford were in the fertilizer business under the provisions of this contract the farmers would get much cheaper fertilizer. There would be a less cost in the distribution as proposed by Mr. Ford, after the fertilizer was produced, and different ones have testified here that at Muscle Shoals it can be produced for one-half what it has heretofore been produced for, and by a co-operative method of distribution there would be economies to that end which we do not have the opportunity of getting the benefit of now.

Then, again, there is another thought I would like to bring to your attention. I am told, although I was not present, that on yesterday one of the witnesses, Mr. McDowell, of the National Fertilizer Association, speaking for the members of the organization (names of the members of this organization are given in appendix), testified that by-product of ammonia gas from the coke ovens was produced at about \$6 a ton, each ton being equivalent to about 4 tons of sulphate of ammonia, plus the acid that they mixed it with at a cost of some \$12 or thereabout per ton; or, in other words, if you add the \$12 for the sulphuric acid that you mix it with and add this \$1.50 for the ammonia gas and make some

allowance for mixing it, which would run into the teens in some places—say \$18—when I am this year trying to buy that same product for my orchard I am asked for it from \$57 to \$60. Now, it seems that there is room for economy, and there is room for getting on a less cost factor basis in that business; and with our experience in trying to buy and finding the same prices anywhere we go in a given territory, then when they come here voluntarily and testify that it does not cost more than that, we are awfully anxious that somebody be allowed to find out what happens in the dark, between the cost of this production and what it costs us.

If the fertilizer folks believe some phases of thei'r own testimony here when they say it can not be done and that neither Mr. Ford nor anyone else can do it, why are they worried about it?

I have no figures, but it just drives through my mind that they would not worry a minute about it and would not be here testifying if they believed their own testimony.

Just along this line, I think I need not call your attention to the fact that in addition to testifying here there is a propaganda going on. I think no doubt the Members of Congress have gotten circulars and all kinds of printed matter to show that it can not be done and that this ought not to be done, etc. Down on my farm in West Virginia I am getting that literature. Of course, I am simply on a list of voters, or something of that sort, and I am getting propaganda to show that it can not be done and to show it ought not to be done, and all sorts of things like that.

There is a well-defined propaganda going on in this country to prevent Mr. Ford from having an opportunity to see what he can do at Muscle Shoals.

The question of power I have already touched on. Power is a great raw material, and every time that you get raw material that is so widely used as power on a less-cost basis, you affect helpfully all the purposes to which that raw material is put.

In the production of electric current about 75 or 80 per cent of the cost is in the interest charged on the investment. It is not the number of people employed at a dam or at a plant or in the electric business that makes the high-priced current. It is the money cost, and if by a proper method of development you can cut the interest rate in half, this amortization method we have spoken of be applied, you can take 80 per cent of that cost out; and if that is true, is it not due the American people that that be done?

If we go on building high cost, as we have, whether it be with a tariff or trade practice or formula or patents, and get so far above the other countries of the world, do we not simply isolate ourselves and bring down trouble on ourselves? A great many nations have air fixation processes; in fact, the United States is the only large Nation that does not have them. Now, while they have air fixation plants in other nations, they are going to produce cheaply. They are going to produce not only cheap fertilizer, but cheap manufactured goods, and if we are going to keep the export trade we have in manufactured goods, as well as in farm products, we must have this cheap raw material, this cheap current, and in that financing is the biggest single item that can make it cost much less money.

As one illustration of the economy effected by the use of electricity, which I did not mention awhile ago, based on the experience of the Chicago, Milwaukee & St. Paul Railroad, if all the railroads were electrified we would save annually 122,500,000 tons of coal, or about one-third of the country's production of bituminous coal, and the coal cars to carry it and the expense of hauling it. Now, that coal if saved will be saved for future uses, but the water is running away. We can not use that water after it has gone over the dam. The streams go on and on forever, but we have lost the economies at this time.

Now, this has been referred to as a subsidy, if Mr. Ford is allowed to have an opportunity to develop these plants at Muscle Shoals. We do not believe that the proposed development is a subsidy. Mr. Ford, if we understand it right, and we believe we do, is not asking for a subsidy and the farmers are not asking for a subsidy. We are asking for a fair opportunity to develop on a proper business basis.

It has been said that 4 per cent bonds will not sell; that you can not finance this enterprise in that way. If you take a 4 per cent Government bond which is nontaxable and add to it the taxes in the local communities, for instance, in New York State where they had 2.7 mills in 1920 or 1.5 in 1921, or the city taxes in the different cities which run from 1 to 3 per cent, that is not such a bad investment; and, in addition, I believe that if it was necessary

is not so; there is not a word of truth in that. We are the successors of this organization," and then both sets of farmers who appear before Congress put up seven men to represent their organizations. How is the President going to know from whom to select or who to nominate as the ones he is to send to Congress for confirmation?

Mr. SILVER. Well, that is one of the things we have wished on the President, whoever he may be at that time. If more than the three mentioned here should recommend their seven, I am entirely willing to leave that to the determination at that time of the President, whoever he may be, in his recommendation.

The CHAIRMAN. You see the peculiar thing involved here, Mr. Silver, is that this is a contract.

Mr. SILVER. Yes; it is.

The CHAIRMAN. You cannot imagine things.

Mr. SILVER. No; but the contract provides—

The CHAIRMAN (interposing). And you have got to go by the terms of the contract.

Mr. SILVER. But the contract provides for their successors. There may be some question as to who they may be, but the contract provides that at the time the matter comes up there shall be some action taken as to who they are.

The CHAIRMAN. The courts and Congress, even, will abide by the language in the contract.

Mr. SILVER. Yes.

The CHAIRMAN. I can see that possibly great differences can grow up, and we can have bitter fights about this end. Now, is it not better to try to reach some agreement which will make it clear and specific as to just who is meant.

Mr. SILVER. What is your thought, Mr. Chairman?

The CHAIRMAN. I have not given it any great amount of thought, because I have been busy with a lot of other things; but I really think it will not take a long time for the men who are in the organizations to think out a procedure whereby it will be absolutely definite as to who the men will be that the President shall name for this board.

Mr. GARRETT. Mr. Chairman, would you mind asking him the question there as to whether it would be objectionable to this organization to provide that in the event of their disappearing from activity, that in that event the Secretary of Agriculture shall make the suggestion to the President referred to in this paragraph.

The CHAIRMAN. You have heard the suggestion of the gentleman from Texas. He suggests that if your organization goes out of business and you have no successor, that the Secretary of Agriculture might be empowered to name seven men from whom the President shall make his selection.

Mr. SILVER. Yes.

The CHAIRMAN. Would that be satisfactory?

Mr. SILVER. I would be very glad to have any suggestions from the committee, but I would not want to acquiesce in any change without submitting it to our executive committee. We have discussed some clarifying expressions with the maker of the tender, and I still have a reservation here as to that matter for future use, and I will be glad to submit that suggestion, among others, to our executive committee, so that we may have a meeting of minds as to the best thing that can be done. We want the best possible thing we can get out of the situation.

The CHAIRMAN. The only thing that has impelled me to mention this matter at this time is that we have had discussions on that very thing with several witnesses, and as you represent a farm organization, I wanted to bring it to your attention and see what recommendations you might make. I think your organization and the other organizations and the members of the committee can finally work out a thing that will be thoroughly satisfactory to everybody concerned.

Mr. SILVER. Yes; I thank you for the suggestion, and feel sure that we all want to cooperate; and that the language which makes it right the committee and the Farm Bureau would want to accept in good faith.

Mr. MCKENZIE. Mr. Silver, you are speaking to our committee as the representative of all the organized farmers of the United States, as I understand you.

Mr. SILVER. I speak as the representative of the American Farm Bureau Federation. The other farm organizations are in accord with the thought, but I am not officially speaking for them. This contract or clause was written after consultation and agreement with the farm organizations, but I am not the official spokesman of the other groups.

Mr. McKENZIE. I assume, however, that the views expressed by you have the approval of the other farm organizations?

Mr. SILVER. Yes. There is no difference of opinion, so far as I know, between us.

Mr. McKENZIE. About how many men are included in those organizations, Mr. Silver, just as a rough estimate?

Mr. SILVER. I can speak more definitely for the Farm Bureau Federation. At the last annual meeting, our reports showed around 1,000,000 paid-up members at that time. That is not the full roll that is carried on our books, which will pay in some time later. Owing to financial difficulties among the farmers, some of them are in arrears, but we feel there are around a million and a half perfectly good members in our organization, but the actually paid-up membership in the latter part of November was just about 1,000,000.

Mr. McKENZIE. That is, in the one organization?

Mr. SILVER. Yes; in the one organization. The grange—and I am going by the testimony given by the Washington representative of the grange before a committee in Congress some time since—showed a membership of about 700,000; and, I am not quite sure, but somewhere between a quarter and a half million members was the testimony of the Farmers' Union.

Mr. McKENZIE. If I understood you correctly, you have organizations in practically all of the States of the Union except two?

Mr. SILVER. Yes.

Mr. McKENZIE. In your organization you include in your membership the retired farmers?

Mr. SILVER. Yes.

Mr. McKENZIE. And anyone who has an interest in agriculture?

Mr. SILVER. Yes; the determination in selecting our officers is that their principal source of income shall be from and their principal activity shall be devoted to agriculture.

Mr. McKENZIE. If I understand your testimony, and I think I do, the contention of the men whom you represent is that they are compelled to carry on their lifework and to pay a higher rate of cost for the production of their products than they can well do?

Mr. SILVER. Right.

Mr. McKENZIE. And sell their production at the prices fixed in the markets?

Mr. SILVER. In the markets of the world, which is the market we sell in. That is right, Mr. McKenzie.

Mr. McKENZIE. And your contention is that one of two things must happen: Either the cost of production must be reduced or the price of the farmers' commodities jacked up or elevated.

Mr. SILVER. Right.

Mr. McKENZIE. That being true has given rise, I take it, to the agitation now going on among, perhaps, I might correctly say, the more radical element in your organization and other farm organizations for congressional action looking to the fixing and stabilizing of the prices of the farmers' commodities.

Mr. SILVER. That is exactly right.

Mr. McKENZIE. Now, I want to ask you whether in your testimony before this committee you have had in mind the one great proposition, that in carrying out the proposal of Mr. Ford, or any such proposal, tending to reduce the cost of the farmers' products, that that is in line with the view of the majority of your people, and would be more in keeping with our traditions and more in keeping with the Constitution of our country than taking the other radical view of attempting congressional action to boost the prices of the farmers' products.

Mr. SILVER. You understand it fully and have stated the question, and my answer is just as your question indicates, because that is the endeavor of our organization. We are not believers in arbitrary price fixing of our products, but we must have a living return out of the products; and in order to get that, if the cost factors can be brought within the proper production costs when we sell our crops, we have the margin which the other groups attempt to get by arbitrarily fixing the prices on some level that they believe will return a profit to them.

Mr. McKENZIE. You contend, as I take it, and rightfully, that the American farmer is entitled to a fair return of profit on his investment.

Mr. SILVER. Yes.

Mr. McKENZIE. And a fair return for his labor.

Mr. SILVER. He must have it.

is not so; there is not a word of truth in that. We are the successors of this organization," and then both sets of farmers who appear before Congress put up seven men to represent their organizations. How is the President going to know from whom to select or who to nominate as the ones he is to send to Congress for confirmation?

Mr. SILVER. Well, that is one of the things we have wished on the President, whoever he may be at that time. If more than the three mentioned here should recommend their seven, I am entirely willing to leave that to the determination at that time of the President, whoever he may be, in his recommendation.

The CHAIRMAN. You see the peculiar thing involved here, Mr. Silver, is that this is a contract.

Mr. SILVER. Yes; it is.

The CHAIRMAN. You cannot imagine things.

Mr. SILVER. No; but the contract provides—

The CHAIRMAN (interposing). And you have got to go by the terms of the contract.

Mr. SILVER. But the contract provides for their successors. There may be some question as to who they may be, but the contract provides that at the time the matter comes up there shall be some action taken as to who they are.

The CHAIRMAN. The courts and Congress, even, will abide by the language in the contract.

Mr. SILVER. Yes.

The CHAIRMAN. I can see that possibly great differences can grow up, and we can have bitter fights about this end. Now, is it not better to try to reach some agreement which will make it clear and specific as to just who is meant.

Mr. SILVER. What is your thought, Mr. Chairman?

The CHAIRMAN. I have not given it any great amount of thought, because I have been busy with a lot of other things; but I really think it will not take a long time for the men who are in the organizations to think out a procedure whereby it will be absolutely definite as to who the men will be that the President shall name for this board.

Mr. GARRETT. Mr. Chairman, would you mind asking him the question there as to whether it would be objectionable to this organization to provide that in the event of their disappearing from activity, that in that event the Secretary of Agriculture shall make the suggestion to the President referred to in this paragraph.

The CHAIRMAN. You have heard the suggestion of the gentleman from Texas. He suggests that if your organization goes out of business and you have no successor, that the Secretary of Agriculture might be empowered to name seven men from whom the President shall make his selection.

Mr. SILVER. Yes.

The CHAIRMAN. Would that be satisfactory?

Mr. SILVER. I would be very glad to have any suggestions from the committee, but I would not want to acquiesce in any change without submitting it to our executive committee. We have discussed some clarifying expressions with the maker of the tender, and I still have a reservation here as to that matter for future use, and I will be glad to submit that suggestion, among others, to our executive committee, so that we may have a meeting of minds as to the best thing that can be done. We want the best possible thing we can get out of the situation.

The CHAIRMAN. The only thing that has impelled me to mention this matter at this time is that we have had discussions on that very thing with several witnesses, and as you represent a farm organization, I wanted to bring it to your attention and see what recommendations you might make. I think your organization and the other organizations and the members of the committee can finally work out a thing that will be thoroughly satisfactory to everybody concerned.

Mr. SILVER. Yes; I thank you for the suggestion, and feel sure that we all want to cooperate; and that the language which makes it right the committee and the Farm Bureau would want to accept in good faith.

Mr. MCKENZIE. Mr. Silver, you are speaking to our committee as the representative of all the organized farmers of the United States, as I understand you.

Mr. SILVER. I speak as the representative of the American Farm Bureau Federation. The other farm organizations are in accord with the thought, but I am not officially speaking for them. This contract or clause was written after consultation and agreement with the farm organizations, but I am not the official spokesman of the other groups.

Mr. McKENZIE. I assume, however, that the views expressed by you have the approval of the other farm organizations?

Mr. SILVER. Yes. There is no difference of opinion, so far as I know, between us.

Mr. McKENZIE. About how many men are included in those organizations, Mr. Silver, just as a rough estimate?

Mr. SILVER. I can speak more definitely for the Farm Bureau Federation. At the last annual meeting, our reports showed around 1,000,000 paid-up members at that time. That is not the full roll that is carried on our books, which will pay in some time later. Owing to financial difficulties among the farmers, some of them are in arrears, but we feel there are around a million and a half perfectly good members in our organization, but the actually paid-up membership in the latter part of November was just about 1,000,000.

Mr. McKENZIE. That is, in the one organization?

Mr. SILVER. Yes; in the one organization. The grange—and I am going by the testimony given by the Washington representative of the grange before a committee in Congress some time since—showed a membership of about 700,000; and, I am not quite sure, but somewhere between a quarter and a half million members was the testimony of the Farmers' Union.

Mr. McKENZIE. If I understood you correctly, you have organizations in practically all of the States of the Union except two?

Mr. SILVER. Yes.

Mr. McKENZIE. In your organization you include in your membership the retired farmers?

Mr. SILVER. Yes.

Mr. McKENZIE. And anyone who has an interest in agriculture?

Mr. SILVER. Yes; the determination in selecting our officers is that their principal source of income shall be from and their principal activity shall be devoted to agriculture.

Mr. McKENZIE. If I understand your testimony, and I think I do, the contention of the men whom you represent is that they are compelled to carry on their lifework and to pay a higher rate of cost for the production of their products than they can well do?

Mr. SILVER. Right.

Mr. McKENZIE. And sell their production at the prices fixed in the markets?

Mr. SILVER. In the markets of the world, which is the market we sell in. That is right, Mr. McKenzie.

Mr. McKENZIE. And your contention is that one of two things must happen: Either the cost of production must be reduced or the price of the farmers' commodities jacked up or elevated.

Mr. SILVER. Right.

Mr. McKENZIE. That being true has given rise, I take it, to the agitation now going on among, perhaps, I might correctly say, the more radical element in your organization and other farm organizations for congressional action looking to the fixing and stabilizing of the prices of the farmers' commodities.

Mr. SILVER. That is exactly right.

Mr. McKENZIE. Now, I want to ask you whether in your testimony before this committee you have had in mind the one great proposition, that in carrying out the proposal of Mr. Ford, or any such proposal, tending to reduce the cost of the farmers' products, that that is in line with the view of the majority of your people, and would be more in keeping with our traditions and more in keeping with the Constitution of our country than taking the other radical view of attempting congressional action to boost the prices of the farmers' products.

Mr. SILVER. You understand it fully and have stated the question, and my answer is just as your question indicates, because that is the endeavor of our organization. We are not believers in arbitrary price fixing of our products, but we must have a living return out of the products; and in order to get that, if the cost factors can be brought within the proper production costs when we sell our crops, we have the margin which the other groups attempt to get by arbitrarily fixing the prices on some level that they believe will return a profit to them.

Mr. McKENZIE. You contend, as I take it, and rightfully, that the American farmer is entitled to a fair return of profit on his investment.

Mr. SILVER. Yes.

Mr. McKENZIE. And a fair return for his labor.

Mr. SILVER. He must have it.

Mr. McKENZIE. The same as any other man.

Mr. SILVER. Yes.

Mr. McKENZIE. Now, then, if the cost of production can be reduced, then proportionately the sale or the price of the sale to the consumer can be reduced and the farmer still earn a reasonable profit.

Mr. SILVER. That is true, whenever we are on a cost basis. Of course, a great deal of our stuff at this time has been below the cost of production, but at any time when the economies are sufficient to offset the difference between the actual price and the sale price then we get on the basis you speak of.

Mr. McKENZIE. I understand you are not contending now that the freight rates should be reduced and the cost of fertilizer reduced and the cost of binders and other agricultural implements which you have to use in farming shall be reduced, and that the farmer shall enjoy all of that reduction for his own particular benefit, and that the selling price shall be kept at the maximum.

Mr. SILVER. No.

Mr. McKENZIE. But you are demanding that this action be taken in order to lower the cost to the farmer, in order that he can sell in a market that is fair to the consumer and still have a reasonable profit.

Mr. SILVER. You have stated the question correctly.

Mr. McKENZIE. That is your battle.

Mr. SILVER. Yes, sir.

Mr. McKENZIE. That is the battle you are fighting now.

Mr. SILVER. Yes; that is the fight.

Mr. McKENZIE. Now, this question of Muscle Shoals, it strikes me—and I do not care whether it is Muscle Shoals or Niagara Falls or Keokuk Dam on the Mississippi River—

Mr. SILVER (interposing). No; and we do not, either. It is just the opportunity we are looking at.

Mr. McKENZIE. To my mind it is a more far-reaching economic and, perhaps, political question than we might think at first blush.

Mr. SILVER. I think you are right.

Mr. McKENZIE. In other words, it has within it the germ of bringing about a revolution in this country so far as the cost of agricultural products is concerned.

Mr. SILVER. That is true.

Mr. McKENZIE. And would be reflected in benefit to the consumer as well as benefit to the farmer.

Mr. SILVER. That is true.

Mr. McKENZIE. And I want to ask you another question, and I am asking this simply to get your views on these matters in the record, because I have my own views about it, but that it not material, perhaps.

Mr. SILVER. Yes.

Mr. McKENZIE. There is one of two ways of operating this plant; one is by Government ownership and operation and the other is by private management.

Mr. SILVER. Yes.

Mr. McKENZIE. You have had a good deal of experience and have been somewhat of an observer, and I take it you are a good American citizen.

Mr. SILVER. I trust so.

Mr. McKENZIE. What is your judgment as to the wisdom of governmental operation of any kind of a public utility?

Mr. SILVER. The members of the Farm Bureau, to which I belong, believe—and this is broadly speaking—that the Government should not act where the individual can.

Mr. McKENZIE. Then it is your belief that this particular project can be operated by individuals?

Mr. SILVER. We now have under the Ford tender that opportunity. We did not have that a year or two ago. It is so big that it has been bigger than the individual could handle. It is an enormously big proposition, and nobody was willing to come forward to handle it. I am talking now about individuals. It was at that time a governmental institution. It still requires the procedure of the Government to make it possible for Mr. Ford to work it, although he is a wonderfully rich man and has a big, strong organization, but we want it operated under the Ford offer, if we can have it so, as a private operation. That is our wish.

Mr. McKENZIE. Of course, this committee is not swayed, I take it, notwithstanding the statement of our good colleague, Mr. Quin, toward Mr. Ford.

Mr. SILVER. No.

Mr. McKENZIE. Or the Alabama Power Co., or any other organization. We have been trying to solve this problem in a fair way, but I am very glad, indeed, to hear you say that if it is possible to side-step governmental operation of this plant and have it operated by Mr. Ford or some one else as an individual proposition that you believe it will serve the best interests of our Government.

Mr. SILVER. We sincerely believe that, not only in this case, but in connection with the railroads. In the 1,500 farm bureaus which we had at the time of the question of the Government turning back or not turning back the railroads, after Government operation during the war, not one single farm bureau in the United States voted for Government ownership. Each and every one voted for private operation of the railroads. Now, that is the kind of people whose wishes I am reflecting here in this matter.

Mr. McKENZIE. Of course, if it was operated by Government ownership, the subsidy spoken of by some of the gentlemen who have appeared before us would go on just the same, except the subsidy would be paid to the farmers by the Government instead of being paid to Mr. Ford. Is that your view of it?

Mr. SILVER. If you can interpret it in that way. To my mind it is not a proper interpretation; but if it were true, it would go on just the same.

Mr. McKENZIE. In other words, in order to sell to the farmer at a reasonable price fertilizer produced by governmental operation, would it be your judgment that we would have to have one hand in the Treasury to make up the difference between what it cost the Government to manufacture it and what the individual could manufacture it for under like circumstances?

Mr. SILVER. I do not know whether I quite catch your question, but if I do catch it, I would say no; but I am not quite sure about your question. I do not think for a moment that Mr. Ford or Mr. Anybody else operating Muscle Shoals as proposed under this tender has one hand in the Treasury.

Mr. McKENZIE. No; I do not mean that; but I mean that if the Government was operating it as a governmental proposition, in order for the Government to be able to sell to the farmer fertilizer at a price lower than that at which it is now produced by individuals in this country, the Government would have to make up the losses by taking money out of the Treasury. In other words, the men appointed by the Secretary of War or by some other governmental administrative head here in Washington, perhaps, bank clerks and druggists and pharmacists, and so on, to go down to Muscle Shoals to manufacture fertilizer for the farmer, probably would not be able to work on as economical a basis as the man employed by individuals, who would only employ such men as would be competent to do the work which they were expected to do.

Mr. SILVER. We believe you would get more economical operation in private industry than you would in a Government-operated industry; but at Muscle Shoals, in this particular case, we believe that the economies in the operation that would be available there by the cheap raw material and power would cut costs below the costs that generally prevail now, not only in the cost of production, but in the cost of distribution.

Mr. McKENZIE. That is true, and I am afraid I have not made myself plain. I am trying to bring out the fact that from experience and observation it is apparent, it seems to me, to everyone, that governmental operation of a utility such as this would be, or of a manufacturing enterprise carried on by the Government, could only be carried on at a loss as compared with the operation of the same plant by private ownership.

Mr. SILVER. We think that Government operation would be higher with the same plant and with all the economies balanced.

Mr. McKENZIE. Then by selling this property or entering into a lease with Mr. Ford or some one else who might make a better offer, having in mind the interests of the Government first, we would be infinitely better off, and the people of the country would be better off, than for the Government to undertake the operation of it as a governmental activity. Is not that true?

Mr. SILVER. Yes.

Mr. McKENZIE. I am glad to have you say that, and I think that is all I want to ask you.

Mr. GREENE. Mr. Silver, you said you did not think this proposition of Mr. Ford involved a subsidy from the Government.

Mr. SILVER. Yes.

Mr. GREENE. Of course, the word "subsidy" is a sort of portmanteau word. You can put almost anything into it and call it by that name.

Mr. SILVER. Yes.

Mr. GREENE. Subsidies take various forms. Suppose the Government had an immense property such as the one at Muscle Shoals and sold it to a private

enterprise at a price not only way below what it had already invested in it itself but at a price far below its commercial valuation, so that the private enterprise, entering upon its use, had only a limited amount of money to charge off to capital stock, and could do business thereafter on a basis entirely different from the basis that private enterprises elsewhere must follow, would not that amount to a subsidy?

Mr. SILVER. There might be such an interpretation in some minds. That is not the generally accepted use of the word "subsidy," however, is it? I do not so understand it. Now, they might have the advantage to be gained by having bought something cheap.

Mr. GREENE. Exactly.

Mr. SILVER. But that is not the usual use of the word "subsidy."

Mr. GREENE. Then, if we do not want to split hairs over the meaning of the word "subsidy" and turn ourselves into a dictionary committee, let us see what a subsidy does. A subsidy gives an advantage in bookkeeping; a subsidy gives an advantage in the economical administration or operation of anything. It helps to pay the expense. That is what it is designed for, is it not?

Mr. SILVER. Yes; that is one way of stating it.

Mr. GREENE. And that is the only purpose of it, so that a man can come out even or better.

Mr. SILVER. It is to be a helpful thing.

Mr. GREENE. And whatever term we call it by and whatever form the proposition takes, it reduces itself to the fact that the man who gets the benefit of it does not have to put so much of his own money into it in order to come out even.

Mr. SILVER. That is one way of stating it.

Mr. GREENE. That is an accurate way, is it not?

Mr. SILVER. I did not question the accuracy of it.

Mr. GREENE. Then, if the Government starts out on a policy by which it takes a very valuable property which has, we will say, loosely, an indefinite commercial value, and nobody knows probably the accurate value or how much you would charge this thing off to be worth, but worth very much more than the \$5,000,000 Mr. Ford offers for it—

Mr. SILVER. Yes.

Mr. GREENE (continuing). And also agrees to put its own money into it in order to complete the fixtures before it is turned over to Mr. Ford.

Mr. SILVER. Yes.

Mr. GREENE. A private enterprise starting out with such a plant as that would have a tremendous advantage over any other private enterprise that had to raise its own money and had to get a water power wherever it could and under the best terms it could.

Mr. SILVER. Let us think about that a moment. Mr. Ford agrees to pay, using the illustration you gave, the \$5,000,000 for a certain plant. He does not buy that plant as you or I would buy a plant and turn it over to whatever purposes we might see fit, as was done in my own State of West Virginia at Nitro and at some other places, but he buys it and agrees to carry it for a certain specific purpose and to carry it for the Government's use as a going concern, equipped and manned whenever it may be needed, and there is a cost factor there that ought to be thought about.

Mr. GREENE. I am not trying to neglect the terms of the contract. I am trying to get at the policy of it. I am simply asking you these questions in good faith, and not necessarily as an antagonistic proposition, but we want to get at the various angles of the matter. This thing is bigger than fertilizer. It means entering upon a public policy and by the very terms of the contract we bind ourselves and our children and our children's children and generations thereafter following, and the question is whether you believe it is good public policy for the Government itself to contribute property and funds, whatever may be the amount that subsequent bookkeeping may disclose. We are talking about the principle of contributing property and funds to enable one private enterprise to compete against any other and against all the others in the production of any particular material.

Mr. SILVER. Now, we will just turn that into dollars, because property in one sense is dollars, and think about it a little bit in different terms than the specific property involved there. We are doing a great deal of reclamation work. The Government is putting money in dams and in other things necessary to irrigate arid lands and produce more foodstuffs and raw materials for clothing, and in order to do that the soil needs water. Now, in this particular case they take the water and put it over a wheel and catch from the atmosphere a ferti-

lizing element and put it back on the leached soil from which we have been taking foodstuffs and raw materials for clothing, etc., and sending them away. When you go back to the question involved there it is simply a question of this sort: Is it a desirable policy for the Government to encourage agriculture as a basic thing or not?

Mr. GREENE. The instance you cite of irrigation of arid lands arises out of an entirely different set of conditions.

Mr. SILVER. But it is mostly the same kind of production, of foodstuffs and raw materials for clothing.

Mr. GREENE. I am trying to get at your idea of the principle involved. It is naturally the first duty of a Government to see that the people who respond to it and who are obligated to it at least have a spot of ground to live on. That is necessary. That is something upon which there is no possibility of anybody obtaining some soil out of private resources. They must be provided for somewhere, because that is ultimately a physical condition; they have to live.

Mr. SILVER. And they must have foodstuffs and raw material for clothing.

Mr. GREENE. I am getting at the basic, because if you have to consider foodstuffs, then have to follow that line of sequences, you will finally have a principle under the operation of which there would be equal reason for the furnishing of moving pictures and things of that sort.

Mr. SILVER. We do not need a plot of ground in order to produce food and clothing.

Mr. GREENE. Not all plots of ground produce food.

Mr. SILVER. But we have got to have the plots of ground to produce foodstuffs, as well as having other things.

Mr. GREENE. I do not want to carry this discussion to a point where it will weary the committee or take up too much of its time. These lands which are irrigated were once Government land, and the Government by adopting a policy is restoring the arid lands to use. If you start with the theory that you can put anybody up in business to compete against private industry with the aid of Government funds, where are we going to stop?

Mr. SILVER. When you irrigate arid lands you set somebody up in business to compete with the other farmers, and you produce more foodstuffs and raw materials for clothing.

Mr. GREENE. You started out with the idea that you were furnishing homes for people, and you do not contend that the arid lands are a serious competitor with the rich agricultural lands of the country. They are places where people can live.

Mr. SILVER. To my mind, you have to carry along just what I stated a few minutes ago, that where those lands were barren without water, the Government put up the money to put the water on those lands. In this case it is putting up the money to put the product of the water back on the soil. I think that is a complete answer. I may not be answering the question adequately to your mind, but to my mind that is the reaction.

Mr. GREENE. Then, if the Government can subsidize directly or indirectly by any amount of advantage in economics one enterprise that it selects by contract so it may compete against other private industries—in this particular case it is the manufacturer of fertilizer—where are we to draw the line? What other industry that has now the investment of capital in the enterprise furnished by private citizens will be the next one to meet competition by subsidy?

Mr. SILVER. I do not for a moment think of it as a subsidy. On the other hand—and I am not going to enter into a discussion of that—the Government levies a tariff, which is a class privilege, that may or may not be justified, and it takes from one group of people and gives to another by Government authority.

Mr. GREENE. On that theory would you argue that two wrongs made one right?

Mr. SILVER. No, sir; but I do contend that there are sometimes conditions that justify certain things being done, and Congress in its wisdom tries to do that, taking into consideration the fact which they realize that they sometimes tread on people's toes. But they have used their best judgment to do a helpful thing for the people as a whole.

Mr. GREENE. There are other raw materials or essentials to industry in other lines which are quite as essential to the support and maintenance of society as fertilizer. I realize that agriculture is the mother of the arts, but

our presently organized social system depends on other things as much as on fertilizer.

Mr. SILVER. Not until they have gotten something to eat.

Mr. GREENE. But you are balancing it between the present highly organized social system and a return to the primitive way in which everybody would feed himself, as they used to do, and we do not expect to go back to that. We do not want to. But we can not escape from the original conclusion, that we have to eat to live, and having lived there are other things as essential, or else we do not want to eat to live. We do not live to eat. There are other things considered as essential, perhaps clothing, but we do not set up some machinery by which we can assist private enterprise by having favorable terms to compete with its neighbors in the manufacture of clothing.

Mr. SILVER. Just turn your question around—when you say we do not just live to eat. But we do live to eat, if we do not do the things we are discussing in providing the things we are discussing for clothing and foodstuffs, we do not eat to live and do other things.

Mr. GREENE. You would not undertake to convince the committee that you have arrived at that stage where foodstuffs are in a perilous condition.

Mr. SILVER. I am not thinking of to-day; I am thinking of the future.

Mr. GREENE. So am I, and I am wondering what kind of policy we will commit our children to.

Mr. SILVER. Whether we have an abundance of foodstuffs on the most economic basis, or raw materials for clothing on the most economic basis, is the question involved here.

Mr. GREENE. I dare say your mind and mine would not meet on that.

Mr. SILVER. We might not.

Mr. GREENE. You said, concerning the question of financing this proposition, that the farmers would take bonds at 4 per cent.

Mr. SILVER. Yes.

Mr. GREENE. How do you reconcile that with the constant clamor that they can not pay their mortgages on their farms now?

Mr. SILVER. I will qualify that. In the farmer's meetings now the talk is like this: "I have not been able to pay interest on my mortgage; I have not been able to pay; in many instances the girl who was in school has had to get out, because I did not have money to continue her in school; the boy, who was ready to go to school, could not go, because I did not have the funds wherewith to send him, and so on down the line. The house furnishings, which ran down during the war period, are still down, because then it was not thought very patriotic to buy those things, and now I have not the money to buy with." And so on.

But there are still farmers with money, in spite of the fact that farming, as an industry, is in a very unhappy plight; just so unhappy that it can not meet its payments. But, on the other hand, there are some farmers who still have money, and I believe in the 6,500,000 farmers there would be some who, if necessary, could buy these bonds to see that Muscle Shoals was developed, for they are looking forward to its development that would mean a program along the lines of developing our natural resources that would be a help to our farmers.

Mr. GREENE. You think they would come to the support of bond issues for this purpose much more readily than to the maintenance of bonds issued for Federal farm loans, directly for their purposes?

Mr. SILVER. There have been so few Federal farm-loan bonds issued that that is hardly a question which you can raise. I do not know who bought them; but the other day \$75,000,000 of those Federal farm loan-bonds were sold almost in one day.

Mr. GREENE. When the Federal farm-loan proposition was originally presented we were told when the law passed that the farmers would soon take care of themselves.

Mr. SILVER. They did ask for some working capital, and that you give an authorization for a higher interest rate when money was selling higher.

Mr. GREENE. I mean working capital. We were told originally that if we just started them off, that then they would take care of themselves.

Mr. SILVER. But the courts tied them up tight. They were tied up by the court procedure for quite a while, and then we got into a period of high-priced money, so that they had so many handicaps that were not anticipated.

Mr. GREENE. I am not trying to minimize the handicaps that the farmer has been living under, but I am asking whether you have confidence in the

purposes of the farmers as a whole so that you believe that they will finance this proposition any more than any other we have put before them.

Mr. SILVER. I am thinking about the war issues of securities, and that is the only time the farmer had a chance to buy government issues, except the really small amount of farm loans. The farmers did buy war issues to the limit; they were good buyers. I live in an agricultural county, and of the 5,000 men in my home county, over 4,900 invested in Government bonds, or war savings stamps. They were not able to buy in the volume that some other communities were able to buy in.

Mr. GREENE. Of course, that was not a commercial or a business proposition, and you would not make the analogy that people coming to the support of the Government in time of war for patriotic purposes were of the same mind as they would be in the case of a commercial venture.

Mr. SILVER. I grant that, but I do say that in the case of the only chance they ever had to buy they did buy.

Mr. GREENE. They had a chance to put working capital into the Federal farm loans.

Mr. SILVER. The farmer has been asking for months for Federal farm loan bonds. But they have not been supplied, and they have not been in distribution so the farmer could readily get them. Recently they have been selling at a premium. When the time comes that those bonds can reach the farmer readily he will buy if he has the money with which to buy. But whether he has the money depends upon the things we are discussing here.

Mr. GREENE. I come from a farming community that is very thrifty, and I have the utmost respect for my farmer neighbors. I am a descendant of the soil, as all of us in that part of the country are, but I think if I took you from this table to one side and appealed to your business instinct to get your expression as to whether farmers as a rule temperamentally flock to the support of commercial issues supposed to be to their advantage, I think you would want to be sure that the stenographer had a few cautionary limitations in your answer.

Mr. SILVER. In that question I scarcely think you are quoting me, and you are making a suggestion that I do not think I have read into the record.

Mr. GREENE. No, I do not mean that. I am talking about making an investment that the farmer will back up. You and I can not quite get together on the subsidy side of it. There is only one more question I want to ask you.

Of course, the matter of the electrification of railroads by the potential power in the country is naturally one of the great economic problems that confront us, and I do not suppose that you would contend that the mere development of Muscle Shoals would give us much light on that. The water power of the country is not so dispersed geographically that all of the railroads would get power from them even if the power were developed. That is rather a theory than a probability of actual realization, as yet.

Mr. SILVER. I specifically said, on the contrary, that I was not discussing Muscle Shoals from the point of view of operating service, but if developed rightly it will be helpful.

Mr. GREENE. It would be an experiment along that line.

Mr. SILVER. The experimentation is in a very large degree done. Hundreds of miles of railways are now being operated electrically and economically. I am thinking of the national life of our people when I say if we could develop waterways on the plan proposed here, amortizing the cost as we go along, and getting power down on a low basis instead of on a high basis it would be of tremendous advantage. As it is now our waterways and other things are built up by issuing bonds and stock, and more bonds and more stock as the earnings increase, and the cost of material and power is built up to a high level. But if we reverse the proposition as it can be applied to Mr. Ford's tender, and instead of building and financing at a tremendously high rate of interest if we could get it on a low basis we will be helping every kind of activity that can use raw material with the power.

Mr. GREENE. Would you have the Government do that?

Mr. SILVER. I would not hesitate to have the Government authorize a bond issue just for any water-power development that was of sufficient size to enter into our life's activities as this does.

Mr. GREENE. You mean the Government shall stand back of it or stand sponsor for the bonds, or would you authorize their issue by private capital?

Mr. SILVER. Authorizing their issue by private capital means bonds and stocks and more bonds and stocks, building high-cost factors or high-priced raw material and of power all the time. A proposition in this immediate

tender, which I see no reason for not being extended to others, is the amortization of the cost in the way it is provided for here.

Mr. GREENE. But that is not what I was asking you. Would you have the Government authorize the disposal of power by the amortization process and limit such a process by law, or would you have the Government itself own and control the power and itself amortize it on some terms or lease it to private individuals?

Mr. SILVER. Just as I said, I would apply the same principle in the amortization at Muscle Shoals at other places as it is desirable.

Mr. GREENE. That would mean the Government buying property.

Mr. SILVER. The Government starts with the property.

Mr. GREENE. I am not talking about this property.

Mr. SILVER. It has a river to start with. There is no reason why the Government should not amortize the cost of the dam and have the lowest-cost factor in raw material.

Mr. GREENE. I guess we do not get together on that. I am thinking of private water powers now, owned and controlled, because if you start anywhere you would want them all. That is a question of proper national policy, and I think you are getting pretty close to the edge of a dangerous practice. I will just try to make that clear. I am simply trying to draw the line in between the proposition you made to Mr. McKenzie and this proposition. You did not want the Government to own and operate railroads. You thought it could be done better by private enterprise. And yet I wonder if there is very much difference in the Government undertaking to get possession of all these private water powers and then leasing them out on terms to private individuals—I wonder if there is any difference in principle.

Mr. SILVER. The question involved there is not a serious question, nor is it a question of Government operation at all. If the Government does exactly what I suggested and authorizes a bond issue and it is amortized as I have suggested and that policy is carried as far as the judgment of the Government sees fit, but in doing so keeping in mind the public welfare, which applies in the case of railroads and other things which I have mentioned, then I think there will be a solution. The purpose is to get cheap raw material in the way of power needed for the different activities, the essential activities of national life.

Mr. GREENE. You appreciate that once the Government began to direct by that process of limitation the control and administration of all natural resources involved in power it opens a field of going into mines and quarries and other natural resources just the same.

Mr. SILVER. Let me say right there that the group of people I speak for—and I am referring to farmers, largely—are the group of people that, in the main, you have got to rely upon to protect and maintain private ownership. If the farmers of the country had taken a different attitude on the railway question there might have been a different answer to-day. They believe in private ownership, and if at any time big business, as it is sometimes referred to, breaks with the great farming group and their fixed belief in private property, which is more firmly fixed in that group of people than in any other group of our national life, because next to human rights they believe in property rights—if big business does break with that group, although I do not anticipate that they will, because there is no reason for them breaking, organized labor would take the railroads under the Plumb plan or some other plan, from the owners, and organized labor would take the coal mines from the owners, and the very people you refer to are the people you have to rely on to maintain property rights.

Mr. GREENE. You echo my opinion quite convincingly. I believe with you that the substantial element we must depend upon for the old constitutional idea of Government is largely the people of the countryside. I heartily concur in that opinion. That is one of the reasons why I am suggesting to you that in undertaking contracts of this character are we not in danger of beginning to woo them away from their original faith?

At the end of Mr. Ford's offer there is a provision that there shall be a right at the expiration of the hundred-year lease in this company or its successor to the use of the power for all time, under reasonable rates. Do you believe that is healthy public policy?

Mr. SILVER. I read into the record one of the resolutions under which I am acting, which ought to answer that question.

(Thereupon, at 12.30 o'clock p. m., the committee adjourned to meet tomorrow, Thursday, February 23, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Thursday, February 23, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

STATEMENT OF MR. GRAY SILVER—Resumed.

The CHAIRMAN. At noon yesterday we had only completed your examination in part, and this morning we will continue from where we left off. Mr. Hull will begin to ask you some questions.

Mr. SILVER. Mr. Chairman, If I may, I would like to make one statement. Yesterday I read an extract from the report on the superpower system and I did not give it to the reporter. I would like to ask that this entire sheet be included in the record in connection with the part I read on yesterday.

The CHAIRMAN. If there is no objection, that will be done.

(The statement referred to follows:)

"ADVANTAGES OF RAILROAD ELECTRIFICATION.

"Unified operation by electricity, on the other hand, would give much better conditions than any that could possibly be attained under unified operation by steam. There would be a new motive power, in which all units or parts designed for similar service would be identical and interchangeable. There would be pooling of all power, with great reduction of reserves. Repair shops would be consolidated and maintenance would become a standardized manufacturing job. Track capacity would be greatly increased and certain tracks would be allocated to freight or passenger service exclusively. All freight trains would be run on schedule; the average speed would be more nearly the same and would be increased at least to the 12.5 miles an hour needed to avoid the present punitive overtime payments. Engine houses facilities would be much simplified by consolidation.

"The reserves of men and of machinery required for joint operation will be much less than the aggregate of the separate reserves required for individual operation. The great waste involved in the maintenance of separate reserves of motive power is exhibited by the operating statistics of the roads, quoted elsewhere, which show that the average freight locomotive in this territory is in productive service only 3,250 hours out of the 8,760 hours in a year, and the average passenger locomotive only 2,630 hours. With joint electric operation and consequent unification of types of motive power there would be a striking improvement. The steam locomotive runs 8 hours a day; the electric locomotive 20 hours.

"Some of the advantages of electric operation are the conservation of national resources, both of coal and labor; an increase in the capacity of main and yard tracks; an improvement of the physical condition of terminals and an increase in the value of the property, as shown by the New York Central and Pennsylvania terminals in New York City; benefits both to the traveling public and to residents along the route through the elimination of noise and smoke; the possibility of providing multiple-level terminals and freight warehouses; and economy in operation through the use of fuel and machinery for generating energy by a few skillful operators in economical stations as contrasted with a large number of technically ignorant operators with small, uneconomical machines.

"The electric locomotive is equipped with meters that afford complete knowledge and control of operating conditions and that are also a valuable guide in handling the train, particularly in starting a long, heavy train. With electric traction the economy of the entire sequence of operation is not dependent upon one man, as it is with steam. Operation is therefore no longer a matter of individual human judgment, skill, or fidelity. It is this unfortunate human element that nullifies the theoretical advantages of the 'full-jeweled movement' steam locomotive. The effectiveness of the devices for increasing efficiency and capacity, such as brick arches, superheaters, stokers, siphons, automatic fire doors, and power reverses, necessarily depends on the intelligence and faithfulness of the average engineer, and in consequence the average results are low. The inherent wastefulness of the steam locomotive is proved by its own advocates in their claim that '40 per cent of its coal can be saved by the careful use of these auxiliary devices.' Then why be skeptical of a saving of 60 per cent

by a modern power station, which has all these devices in greater completeness and, in addition, has brains to use them?

"The speed of different classes of trains will be more nearly uniform. Much heavier trains can be handled, and at the same time light freight trains can be moved at the speed of local passenger trains. It has been proved that for the heaviest freight service, such as mountain-grade work, the electric locomotive is superior to the steam locomotive, but its superiority in handling light freight at high speed is not so generally understood.

"As the electric locomotive is simple and as all locomotives of a given class are identical and no more skill is required to operate them than is demanded of an ordinary chauffeur, all locomotives will be pooled, so that the total number required will be materially reduced.

"The flexibility of the electric locomotive is much greater than that of the steam locomotive. Its capacity is determined by heating and therefor by the average work it has to do, and not by the maximum grade, which is taken care of by the overload capacity of the engine. With electric traction the maximum grade for the profiles within the superpower zone is practically eliminated as the determining factor in locomotive equipment.

"The availability of the electric locomotive for service is at least twice as great as that of the steam locomotive. After a trip it can be thoroughly inspected in less than an hour, whereas the thorough inspection of a heavy steam locomotive consumes 4 to 10 hours. It requires no water, fuel stations, ashpits, or turntables. The repair shop capacity required is less than a third of that needed for steam locomotives. The expense of track maintenance is reduced and the ballast is cleaner. The engine-house expense is reduced nearly to a negligible amount. In the electric locomotive energy can be regenerated where the profile permits it, thus saving some energy and much wear of brake shoes, bettering the handling of trains, and consequently saving expense in freight-car maintenance.

"As a result of these and other advantages the electric locomotive should, under favorable conditions, handle twice as many ton-miles as the steam locomotive per locomotive-year; on the Norfolk & Western it actually handles three times as many ton-miles. This gain is not possible under all conditions, but it is possible where the traffic is great and the tracks, yards, and terminals are congested, as they are in the superpower zone.

"Electric traction, then, gives increased capacity of main-track yard track, and locomotives with reduced cost of operation and maintenance per ton mile and per passenger-mile." Extract from report of Chief Engineer W. S. Murray on the Superpower Survey.

MR. HULL. Mr. Silver, I want to clear up one question that you answered that was asked by Mr. McKenzie. I do not suppose that you intended in answering the question the full import that your answer might give. It seems to me very important to know just how the farmers stand in regard to one matter. You said that the farmers of the country were opposed to the Government manufacturing or entering into any business that could be conducted by private parties.

MR. SILVER. Broadly speaking, I said that. I used the expression in a broad way, and was trying to use a short expression.

MR. HULL. As I caught it, it might be construed to say that the farmers of this country were in favor of the Government not manufacturing any munitions of war during peace time. Now, that is a very big question, and is one that is pressing hard not only in this country but all over the world, and if the farmers are in favor of private manufacture of war materials in peace time, I am very badly misinformed. As I understand it, they are absolutely opposed to it. I, myself, am very bitterly opposed to it and shall fight this as long as I have breath of life to fight it, and I want to know whether, in your opinion briefly, the farmers only are in favor of private manufacture of munitions of war during peace time, when we have factories that can manufacture the things which factories the Government owns.

MR. SILVER. I agree with your thought as expressed in that particular, that it would be a proper Government function for the Government to provide itself with munitions.

MR. HULL. I simply wanted the record clear; that is all.

MR. SILVER. Yes.

MR. HULL. And now I want to get back to the proposition that is before the committee with regard to the Ford proposition at Muscle Shoals. I understand we are to have another proposition put before us submitted by the Alabama Power Co. They make a proposition which is quite radically different from

Mr. Ford's. They propose to turn back to the Government 100,000 secondary horsepower, and they do not take over plant No. 2 for the manufacture of fertilizer.

Mr. SILVER. Yes.

Mr. HULL. That presents a very different problem for us to consider, because under their plan, plant No. 2 would not be operated.

Mr. SILVER. No.

Mr. HULL. And the question comes up, or naturally will come up. If we should happen, in our wisdom, to accept the proposition of the Alabama Power Co. or a proposition of that kind, are the farmers prepared to finance a corporation that would use this secondary horsepower which they turn back to us to develop this plant No. 2 in the manufacture of fertilizer, as is proposed at the present time by Henry Ford? I think you catch the idea I have in mind.

Mr. SILVER. Mr. Congressman, to my mind the plant at Muscle Shoals, to which you refer, is only a part of what is involved. In addition to the plant which we think has value, although different people have testified it has no value except a junk value, and we differ from them on that, but Mr. Ford's genius and Mr. Ford's capital and his disposition to be philanthropic in this matter are all things that we consider in thinking about the Ford tender and Muscle Shoals, and the Alabama Power Co., or any other company. If we can interest Mr. Ford's genius in this matter it is a great asset to agriculture, and Congress can not confer that genius upon some farmer. Congress can do a great many things, and is a very powerful body, but it can not confer the genius of Mr. Ford upon some farmer and turn him loose to run that plant, if the other things were all in working shape. In addition to that, the farmers are not asking that the plant be turned over to them to see if they can or can not make a success in the manufacturing world. They are asking that the tender be accepted, which has been made by a genius in manufacturing lines, and one who has the capital and machinery and the organization to run the business and has run one of the most successful businesses that ever has been run.

Mr. HULL. Naturally, the question that comes up right there is whether in the Ford proposition there is proper protection as to the future development of that property along the lines you suggest and whether the genius of the organization of Henry Ford will be utilized for the farmers and the people of this country. In other words, while we hope it will not happen, yet life is frail and with a man of the age of Mr. Ford we have no assurance that he will live for any definite period of time, and suppose that in five years he should pass away, have we properly protected the future use of this property along the lines you suggest?

Mr. SILVER. That is a very proper question, but if we carry what you indicate is your thought to a proper conclusion, no farmer would plant a crop because he might not live to harvest it. Farmers do not look at things just like some other folks do. They have faith in the law and have faith in their governmental institutions, and have faith in the integrity of a great many people, although not in all the people. We will have to make the best contract we can with one who has the genius and the capital that will operate this plant, and certain things may have to be taken on faith. Not that I think we are taking any chance in this matter, but, looking into the future, we know that Mr. Ford will not live 100 years. That is one of the things he will not do, but his genius in setting up and starting this machinery may give it an impetus that will carry it on for a long, long time, and there is no other genius similar to Mr. Ford's, and this will make for the American people a great development that has not yet been started.

If you think of this thing broadly, there just comes to my mind something which I do not know whether this is the proper place to bring it in or not, but I will bring it in here anyway. There are two ways of developing this great natural resource. There may be others, but there are two ways that occur to my mind now. One is the way I discussed with you yesterday, and that is to develop this particular project in a way that will be a marker for the development of other similar natural resources and at the same time maintain to the people the equity in the property after the amortization has been completed; and after it is amortized out the public are entitled to the equity. Or we could do the other thing, and there just drifts through my mind the development of our oil and gas business in this country. That was developed under the old thought, and the Standard Oil and other old groups did take a natural resource and build up great fortunes. I am finding no fault with that, because that was the system we were developing under at that time, but are the people better served

by the one kind of development or the other? Is it better for this country to have built great, swollen fortunes, such as the Standard Oil Co. and the great head of that company, Mr. Rockefeller, built up? He has been busy trying to give away what he has been taking from the people. Or is it better to develop a natural resource so that the people can enjoy the equity in it as they go along? How many children on the farm and other places that have no opportunity of school would that great money, taken from a natural resource by the Standard Oil, have helped through school, have helped to a better living, more comfortable clothing in wintertime and a better home, if it had been developed on some other line? That is just the thought that drifts through my mind and I just throw it out for what it may be worth.

Mr. HULL. Of course, your answer is very comprehensive, but still there is a lingering doubt in my mind as to whether your organization of farmers, and not only yours but the others, has properly taken into consideration the protection of the people in the future. Are you thoroughly satisfied that if we accept the Ford contract we have done everything we can to protect the people in the future?

Mr. SILVER. Yes; keeping in mind what I referred to yesterday, that there is a little clarifying language we are discussing with Mr. Ford. With that in mind I would say, emphatically, yes. There is no doubt about that in my mind, as indicated not only by my testimony but by the resolutions adopted by our group in convention, etc., after having studied this question; so that I want to answer your question, definitely and emphatically, yes.

Mr. HULL. Of course, another question that will naturally follow—that is whether if we accept this contract we are not doing the very thing you speak of in building up another great fortune?

Mr. SILVER. The difference I have tried to make plain is that the type of mind and the development which we are asking here is on just the reverse of the other great fortunes. We are asking that the waterways be developed on a basis that maintains or protects the public in enjoying the equity. If we make a cheap raw material of power, which the amortization features of this investment do, we are helping all phases of our national life and we are hurrying up a development which ought to be made.

Mr. HULL. Has your organization analyzed the figures that Mr. Hugh L. Cooper furnished the committee, which sought to demonstrate the fact that if we accept the Ford offer as opposed to the offer by the Alabama Power Co. that in reality, in 100 years I think the figures were, that it is close to \$2,000,000,000 that we will turn over to Henry Ford?

Mr. SILVER. We do not expect to get any help from the water-power trust on this matter. Now, he often is accused of speaking for that group.

Mr. HULL. But figures are figures.

Mr. SILVER. Yes.

Mr. HULL. And they can be analyzed by somebody. I have not had the time and I do not suppose I am competent to analyze the figures, but if he says if we accept Henry Ford's offer, in 100 years we will be short from one to two billion dollars.

Mr. SILVER. Without going into a real, careful analysis of it, if the Government does just what I suggested yesterday, authorize a bond issue and that bond issue is retired, has it cost the Government anything, and the earnings on the basis of the Ford tender will retire them and pay the interest. I do not care whose figures you take or how they juggle figures; is it possible for any such conclusion to be arrived at by a man who is trying to present what is involved to the public or to any other group? Can it reflect such a conclusion as he arrived at?

Mr. HULL. Of course, I do not know that I care to go into the question of figures, and I suppose before we get through we will have experts analyze the figures and tell us who is trying to deceive us, but somebody is certainly undertaking to deceive the committee on the figures, because, as I understand it, if I have Ford's offer correct, and I suppose he has men who are just as capable of figuring as the Cooper organization, as I understand it, he states that his payments will amortize this entire project, pay back to the Government all that we put in in the future, with 4 per cent; is that your understanding?

Mr. SILVER. That is my understanding; and when the Government has been repaid, it can not lose \$2,000,000,000, and it will have the gaining of the taxable property as developed by the operation of this plant.

Mr. HULL. I understand that, but Mr. Cooper says that, taking the same statement, we will be short from one to two billion dollars, and there is a vast dis-

crepancy there in figures, and somebody ought to be able to tell us who is telling the truth.

Mr. SILVER. Yes.

Mr. JAMES. Mr. Silver, were you one of the gentlemen consulted about the wording of section 15?

Mr. SILVER. Yes.

Mr. JAMES. Who else, representing the farmers, was consulted?

Mr. SILVER. Mr. Atkeson, and at the time of the consideration of section 15, to which you refer, part of our executive committee and our legislation committee and some others were with us and went over that measure—Mr. Howard, our president, and Mr. Bradfute, and Mr. McKenzie, and—I do not know that I can name all of them that were present, but there were several of our executive committee and our legislative committee.

Mr. JAMES. Who represented the Grange?

Mr. SILVER. Mr. Atkeson.

Mr. JAMES. Who represented the Farmers' Educational and Cooperative Union of America?

Mr. SILVER. I am not sure whether Mr. Loomis of the Grange was there at the time or not. He was in and out at different times, but whether he was present at that time or not, I am not sure.

Mr. JAMES. Who wrote this language?

Mr. SILVER. I do not know who suggested the original language.

Mr. JAMES. Does that language carry out your ideas, or is that the idea of Mr. Ford?

Mr. SILVER. The matter came to us, of course, in the form of the Ford proposal, and there was a rewriting of part of it, and we still have some matters to debate as clarifying language and not as changing the purposes of the contract. There has been some debate among our group as to just what language most clearly states what is involved here, but we felt at the time that that language was used that it was happy language. We have some suggestions under consideration, as I have twice told the committee, at this time for clarifying it somewhat.

Mr. JAMES. Did you suggest this idea to Mr. Ford or did Mr. Ford suggest it to you?

Mr. SILVER. Which idea, Mr. Congressman?

Mr. JAMES. Section 15?

Mr. SILVER. The form of the original or the first draft, as you might put it, is the form in which it came to us originally, and it was somewhat changed. I do not know that I know just the individual who suggested the language. I do not know whether I have answered your question or not. I want to answer it.

Mr. JAMES. This section provides that the three leading representative farm organizations shall each designate seven members to the board, etc. Was that Mr. Ford's idea to have seven members or was that your idea?

Mr. SILVER. Mr. Ford's original suggestion was that the farmers have representatives on that board. Mr. Ford made that proposal to us.

Mr. JAMES. Yesterday you talked about cooperative distributing of this fertilizer; is there any language that covers that in section 15, and if so, what is it?

Mr. SILVER. Realizing that this is a new development and that cooperative marketing by legal authority is new, although, of course, 10 per cent of the products of the farms of the country are marketed cooperatively, but until recently we had no legal authorization for so doing, and it may not be hooked as definitely as we hope, since the passage of that bill to hook it, and that is a part of the language we have under discussion at this time. The hope and ambition of the farmer and of Mr. Ford is that when this fertilizer is produced, it will be taken by farmer groups for distribution in a cooperative way. We want to not only save in the cost of the production of fertilizer but we want to have all the possible economies in the distribution of it. It is just as important to economically distribute it as it is to economically produce it.

Mr. JAMES. That is your hope, but there is not anything in this proposition of section 15 that has anything at all to do with cooperative distribution, is there?

Mr. SILVER. The contract would not necessarily carry the cooperative distribution, but the farmers can organize other distributing groups without this contract when Mr. Ford delivers it to them, and when we see it is economically produced and is delivered to us we will attend to the distribution.

Mr. JAMES. Mr. Ford's corporation is limited to 8 per cent profit. Do you not think there should be some provision by which the corporation during the 100 years can not farm out territory to certain individuals and then have them farm it out, which they could do unless there was some amendment made to this language? Have you any proposed amendment in mind?

Mr. SILVER. Yes; the language we are are trying to clarify that with has to do with the point you have in mind.

Mr. JAMES. You would like to have whoever buys this property guarantee to manufacture fertilizer, would you not?

Mr. SILVER. We are very much interested in the fertilizer feature. We do not think it is the only feature, but we are very much interested in it, and it is one of the big things we hope to accomplish.

Mr. JAMES. Under section 14, how many tons of fertilizer do you think is guaranteed to be produced per annum?

Mr. SILVER. Mr. Congressman, the per ton basis is not the basis that arises in our minds when we talk of fertilizer. While we buy fertilizer by the ton, the plant food in the ton is the real basis; and when he says he will produce a certain amount of a certain kind of commercial plant food, it may be interpreted in a 2-8-2 goods or in a 2-8-3 or a 2-8-4, or it may be in the form of sulphate of ammonia, which we buy and use on our orchards just in the form of sulphate of ammonia, 24 per cent.

Mr. JAMES. How many tons do you think are guaranteed under section 14 as a minimum?

Mr. SILVER. The capacity of the plant, which is estimated at 110,000 tons of ammonium nitrate, which is one of the parts of the complete fertilizer, and the other parts that are necessary to go with that will make up the complete fertilizer.

Mr. JAMES. The amount of nitrogen, as I understand it, contained in that amount of sulphate of ammonia is 190,000 tons, and in 2-8-2 commercial fertilizer the amount is 1,925,000 tons?

Mr. SILVER. In that formula; yes.

Mr. JAMES. And in 3-8-3 commercial fertilizer, 1,283,300 tons, and in 4-8-4 commercial fertilizer, 962,500 tons. Do you not think those figures ought to be included in this proposal, so that we will know definitely about that feature of it?

Mr. SILVER. I want to carry you back just a minute to the testimony of the Bureau of Soils. There is a great amount of fertilizer used, and it is used on quite a few crops, but the fertilizer needs change from time to time. You may not want that same formula, and we want different formulas on different crops. If you specified in this contract certain fixed formulas for them to deliver a certain tonnage by, I wonder if we might not put something in that was hurtful rather than helpful. I am in sympathy with your thought, and we want the greatest output; but if we go to writing it in there in fixed formulas, I wonder if we do not do a hurtful rather than a helpful thing.

Mr. JAMES. Read me the exact language where he agrees to manufacture fertilizer.

Mr. SILVER. Where he agrees to manufacture it at all?

Mr. JAMES. Yes.

Mr. SILVER. I am reading from section 14:

"The company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control," etc., which is the usual clause in industry. He says they will manufacture it.

Mr. JAMES. He agrees to manufacture the compound, but can not the compound be used for other things.

Mr. SILVER. Outside of the war-time needs of some of these things, and the explosive and fertilizer elements are largely the same, outside of that, the fertilizer is the great place where all the manufacturers of these chemicals look for the sale of their products. In addition to that, I have the greatest belief and faith that under that language they could not well do any other thing. It refers to fertilizer, and further down it says, "In order that the farmers may be supplied with fertilizers at fair prices and without excessive profits." The whole of sections 14 and 15 refer to the producing and supplying of the farmers with fertilizers at reasonable prices. I scarcely think that any mind can read this section—and I am thinking of the judicial mind that

might have to interpret it—and I do not think any mind would read that altogether and say that there was but one purpose that could rightfully be accomplished, and that is to produce and supply fertilizer for agricultural purposes.

Mr. JAMES. Do I understand that Mr. Ford is going to offer an amendment clearing that up?

Mr. SILVER. I think there will be some clarifying language.

Mr. KEARNS. Would your organization accept any proposition or advise the acceptance of any proposition other than one coming from Mr. Ford?

Mr. SILVER. It is a little hard to answer a moot question. I do not know what might be proposed, Mr. Congressman. As it stands at this time, there is no doubt about their viewpoint, and as it has stood up to this time—the Ford tender has been made for some seven months and has been printed and published to the world at large, and to our mind there is nothing comparable with it; and in addition to that, we still go back to the point of this genius of Mr. Ford, which we hope to help along in this situation.

Mr. KEARNS. You or your organization are banking a great deal, then, on the genius of Mr. Ford.

Mr. SILVER. Sure, we bank a great deal on the genius of Mr. Ford along with other things.

Mr. KEARNS. Why; what has justified you in such a belief as that?

Mr. SILVER. Mr. Ford's business life with the farmers has been such that they have a very great amount of confidence in him and in his ability to construct the great manufacturing industry that he has. It took genius to do it, and Mr. Ford has passed the place where he has any selfish need for money.

Mr. KEARNS. So has Rockefeller, has he not?

Mr. SILVER. Yes; but they have led different kinds of lives.

Mr. KEARNS. How is that?

Mr. SILVER. Well, it may be difficult to answer how it is, but it is a fact that they have done it.

Mr. KEARNS. They have both amassed great fortunes.

Mr. SILVER. Yes; by different methods.

Mr. KEARNS. And they have gotten that fortune out of the pockets of the American people.

Mr. SILVER. Yes, sir.

Mr. KEARNS. Both of them.

Mr. SILVER. Yes.

Mr. KEARNS. Mr. Ford, if newspaper reports are true, stated the other day that he had made \$1,000,000,000 himself, and he got that out of the pockets of the American people.

Mr. SILVER. Yes.

Mr. KEARNS. That does not indicate he is a great philanthropist, as you said awhile ago, does it?

Mr. SILVER. Mr. Ford has done just exactly what you challenge. He has shown that in his production at all times he has maintained it on the lowest possible level consistent with proper wages and proper living conditions for his people, and has supplied the public with the wares on a basis under what other people have done.

Mr. KEARNS. Do you not think he could have furnished this product to the American people on a much cheaper basis than he has done if he has amassed \$1,000,000,000 in the last few years; do you not think he has been charging them a pretty good tariff?

Mr. SILVER. If I read the same article that I presume you refer to, it was a newspaper article—

Mr. KEARNS. Yes.

Mr. SILVER. If I read the same article, I understand he did not plead guilty to having made \$1,000,000,000, although it does not make much difference in the point you make, but I just want to call your attention to the fact that he specified he had around \$100,000,000 of real estate and \$100,000,000 of machinery, and over \$100,000,000 of money that might by some means be capitalized and earn on \$1,000,000,000. Now, that is a different thing. He has not capitalized and earned on \$1,000,000,000.

Mr. KEARNS. I think his exact statement was that his real estate holdings, his deposits in the banks, his personal property of various kinds, and his good will could be capitalized at \$1,000,000,000.

Mr. SILVER. Yes; I think that is right. We agree about that.

Mr. KEARNS. Now, do you not believe that if he had had the interest of the American people or of his customers at heart, he could have conducted busi-

ness and exacted a less profit than one that would net him \$1,000,000,000 in 10 or 15 years?

Mr. SILVER. You get back to the point and you make the statement that he has netted that. As I read the statement, he has not netted that amount, but I will not contend about that point. He has made several hundred million dollars, according to his own statement, and he has made it in such a way that the people who have bought his wares and consequently paid that money are not unfriendly to him. They have gotten more for their money when they dealt with Ford than when they dealt with somebody else.

Mr. KEARNS. They paid a big tariff on it, however, at that.

Mr. SILVER. At that time, if it had not been for Ford's genius, they would have been worse off. They have been able to pay Ford his tariff, if you want to call it that, or his fortune, if you want to put it the other way, and have still been better off than would have been the case with some of these other groups. We do not feel the same way about it.

Mr. KEARNS. Why do you say that the owner of a Ford machine is better off by having one?

Mr. SILVER. Well, it was a choice with the farmer of whether he had a Ford or went on foot. It was just the choice of walking or riding in a Ford. Of course, we can never hope to ride in a Packard or Pierce-Arrow or something of that sort.

Mr. KEARNS. Of course, we all take off our hats to Mr. Ford for having made this money, but what I am trying to get at is why it is that after he has amassed this great fortune and gotten it out of the pockets of his customers you can bring yourselves to believe that he is going to produce fertilizer at a cheaper rate for the farmer than anybody else.

Mr. SILVER. If he just does for us in the fertilizer business what he has done in the "flivver" business, he has provided cheaper goods for us at a good standard and at a cheaper price than anybody else has done.

Mr. KEARNS. There are a great many people, and a great many of them owners of Ford cars, who would not agree with you that he has furnished things cheaper for them in the long run. Of course, the original price is cheaper.

Mr. SILVER. We could get into long argument along that line, but I will go back to my statement that farmers would have either been driving their horse and buggy or walking, who to-day are able to own a Ford automobile. He has made the product on a basis of keeping down cost factors so that we have been able to buy them, and, compared with what we would have paid elsewhere, it has been a bargain when we bought them.

Mr. KEARNS. Well, as the owner of two Fords, I can not agree with you.

Mr. SILVER. You had the alternative of buying somebody else's machine.

Mr. KEARNS. Has your organization read and studied the proposition of the Alabama Power Co.?

Mr. SILVER. Yes; they have studied it to the extent that they see there is no provision for fertilizer in the sense in which we feel it should be in there, and to our mind that is a wall right there.

Mr. KEARNS. Getting back to the proposition of fertilizer, why does not your organization insist on some clause being put in this contract by which this Ford company would be compelled to manufacture some kind of standard fertilizer that is used by the farmers?

Mr. SILVER. If you will tell me what a standard fertilizer is—

Mr. KEARNS. I do not know.

Mr. SILVER. No.

Mr. KEARNS. But I know he has not agreed to make fertilizers in this contract. He has agreed to make a certain component part of the fertilizer.

Mr. SILVER. Yes.

Mr. KEARNS. But has not agreed to make fertilizer.

Mr. SILVER. But the commercial plant food, and as to the carrier, we will agree about that.

Mr. KEARNS. Is there not some clause that could be put in there—I do not understand the formulas for fertilizers—but could not your organization, with all the wisdom that is in the organization, and with the knowledge that the members of that organization must have of the manufacture of fertilizer, could they not devise some clause or construct some clause that would compel the manufacture of fertilizer that would be ready for distribution and use by the farmers?

Mr. SILVER. This clause, keeping in mind the reservations that I have now or twice referred to, is satisfactory to the people that use the fertilizer. Then

I will go back to the statement of the head of the Bureau of Soils, who testified very fully on the fact that different analyses of the soils did not give the same results in the crops. I want to say that the handling of fertilizers and soils is a very difficult thing, and as yet there has been no single formula devised or no plan by which we can know ahead of time just what is the most useful thing, or, if we use it successfully one time, we may need to change it at some other time.

Mr. KEARNS. Getting back to my original statement as to this clause in the contract, I understand that in this contract there is not any language in there that would compel him to manufacture a finished fertilizer, is there? That question can be answered yes or no.

Mr. SILVER. I have not made myself plain to you. I want to do it, Mr. Congressman. If you took any one formula and wrote in there that formula as a finished fertilizer, as I believe you have in mind—

Mr. KEARNS. Yes.

Mr. SILVER (continuing). You would limit the use of the fertilizer and the output of that plant to the particular crop and the particular soil that that one formula applied to.

Mr. KEARNS. I understand that.

Mr. SILVER. And consequently you would deny a great many people access to the product of that plant.

Mr. KEARNS. That is just the question I am asking. Can not your organization devise language here that would compel him to manufacture fertilizers, we will say, the finished product, whatever that may be, if he is desirous of making fertilizers for the farmers, so that he may advance the cause of the farmers, rather than the cause of his own company; then could you not get together and put in your contract an agreement by which he agrees to make fertilizers as the needs of the time should demand. I will put it in that way.

Mr. SILVER. The farmers would not want to enter into a contract for 10 years or 100 years based on a specific demand.

Mr. KEARNS. I do not mean a specific fertilizer, but could you not devise language that will compel him to make fertilizers that will be demanded by the farmers from time to time?

Mr. SILVER. And this does specifically provide for the manufacture of the commercial plant food involved in fertilizers.

Mr. KEARNS. Yes; involved in fertilizers, I will admit that.

Mr. SILVER. This provides for that, and the only way to market that and sell it is to sell it in fertilizer.

Mr. KEARNS. But suppose under his contract he made this nitrate and then refused to go any further. How are you going to compel him under this contract to go any further. That is what I would like to know, how you propose to do that?

Mr. SILVER. I think that is one of the features that we can well take with a certain amount of faith and also on the language we have under consideration and have not yet submitted.

Mr. KEARNS. But you are asking us, Mr. Silver, to vote into the hands of Mr. Ford practically \$150,000,000 that belongs to the taxpayers, and when we do that we do not want to take too much on faith.

Mr. SILVER. Yes.

Mr. KEARNS. We want something in the contract. In other words, we want it denominated in the bond.

Mr. SILVER. We think there is something in the contract. I do not mean to say that this contract is without force and effect. To my mind I can not think of a manufacturer, I do not care who the manufacturer is, manufacturing and agreeing to manufacture and to keep on manufacturing for 100 years and not keep up his outlet, and there is only one outlet that he can hope to occupy at all times and under all conditions for the output of that plant.

Mr. KEARNS. But under this contract he can sell it to other fertilizer firms, if he wants to, or to anybody else.

Mr. SILVER. That is the point about which we are discussing some clarifying language, and that is one of the points I referred to in answer to one of the other gentlemen. I think we will have a suggestion to make before the hearings are closed that will answer that particular question.

Mr. KEARNS. Do you think you are going to have language in there that will be certain and definite, requiring him to manufacture fertilizer.

Mr. SILVER. We think so. We think we will have language that will not only be entirely happy to us but we trust will be happy to this committee.

Mr. KEARNS. I think the committee wants to know, if it is going to vote out that amount of money, that the farmers are going to get what they are expecting.

Mr. SILVER. Do not think that the farmers want to take any chance about it. They want to be right sure about it, and they are trying to be sure about it, and they have special committees studying and following up this matter, and they want to know just what you want to know.

Mr. KEARNS. If you are studying the matter along those lines, I think the committee will anxiously await a further report from you on that study.

Mr. SILVER. Before these hearings close, we will have the results of that study brought to you.

Mr. KEARNS. Has your organization ever studied or given any consideration to what this plant would cost to build now? If you should find it in the shape that the Government did a few years ago, when they undertook to build this plant, what would it cost to build it and complete it as Mr. Ford wants it completed?

Mr. SILVER. We have this plant just as it stands not like an interested party would go out and find an unoccupied site on a river bank some place. We approach this as a waste of the war, we might say. Now, we either use it or we do not use it, and it is either used and made an asset of or else it is in a large measure wasted.

Mr. KEARNS. I understand that, but that does not answer my question.

Mr. SILVER. Well, I beg your pardon.

Mr. KEARNS. The taxpayers of the United States have already spent there or had on the first day of last July, \$106,000,000 plus.

Mr. SILVER. Yes; whatever the amount may be.

Mr. KEARNS. \$106,000,000 plus, so the Secretary of War testified here, or in round numbers \$106,000,000. Of course, we will grant that that was done under the stress of war, and that a great deal of that money was wasted and squandered, but the question I would like to have answered is what it would cost to-day to do what the Government has already done down there and to complete the plant as Mr. Ford wants to complete it. How much would that cost?

Mr. SILVER. I do not know.

Mr. KEARNS. Do you not think your organization ought to know how much they are giving Mr. Ford? Mr. Ford agrees to complete it, and he believes it will cost anywhere from forty to fifty million dollars.

Mr. SILVER. Yes.

Mr. KEARNS. And he is to pay 4 per cent on what it costs to complete it.

Mr. SILVER. Yes, sir.

Mr. KEARNS. Therefore, he wants the taxpayers of the United States to give him the \$106,000,000 for his use for 100 years without paying anything on it; is not that true?

Mr. SILVER. By the same reasoning, would we not be glad to turn our Navy over to some one who would keep it in good running shape and turn it over to us in time of war? The fellow who did that would not have a bargain.

Mr. KEARNS. But he is going to use this plant in the manufacture of power and he is going to use it to manufacture parts for his automobile, and will possibly manufacture plows, etc.

Mr. SILVER. Sure; but whether business goes good or bad, he has to still keep that plant in shape to produce these needed chemicals in peace time, under this contract, for agricultural purposes, and be ready in time of war to turn it over to the Government as a going concern.

Mr. KEARNS. But is not the cost of that negligible, compared with the money that the Government has already invested down there?

Mr. SILVER. Not according to some estimates of what it would cost the Government to keep it as a stand-by. Maj. Burns testified it would cost \$2,500,000 to keep it in a stand-by condition, charging depreciation, etc., and if we let it stand as an idle concern in 20 years you have lost it, anyhow.

Mr. KEARNS. Let me ask you this question: If Mr. Ford wanted to go down to Muscle Shoals, and there was nothing built there, but he wanted to go there to build a plant, just as any other business firm would want to do, it would cost him at least \$100,000,000 to build the plant the way he wants it, would it not?

Mr. SILVER. No; not according to your statement, because you said that a great deal of money that the Government spent down there was wasted, and I concur in the statement that war expenditures are always wasteful.

Mr. KEARNS. I mean if the plant is completed down there as he wants it, it would cost him at least \$100,000,000 to build it from the ground up?

Mr. SILVER. I do not know that I am competent to guess on what it would cost, but it would cost a heap of money.

Mr. KEARNS. Certainly there was not more than \$56,000,000 wasted down there, which is cutting it more than half in two.

Mr. SILVER. We are just guessing at that.

Mr. KEARNS. Yes; but we will say that it cost him \$100,000,000, and if that is true, the Government is giving him a subsidy of \$50,000,000, is it not?

Mr. SILVER. Now, may I put that around the other way?

Mr. KEARNS. You do not like the word "subsidy"?

Mr. SILVER. Wait. I am going to let you use the word subsidy. I did not like the word subsidy when it was first mentioned yesterday, but I am going to put it around the other way, and maybe I will think more of it. What kind of a subsidy is the Government giving at the people's expense to the present manufacturers of fertilizer if they do not do this?

Mr. KEARNS. What kind of a subsidy?

Mr. SILVER. Yes; are they not subsidizing them?

Mr. KEARNS. How is that? I do not understand that. You mean they are paying them exorbitant prices for the fertilizer?

Mr. SILVER. Yes.

Mr. KEARNS. I will agree with you about that, and I will agree with you about that as to practically every manufacturer to-day, and on the same theory we are subsidizing every manufacturer because practically all of them are charging more for their wares than they are justified in charging.

Mr. SILVER. You and I agree about that situation—and this is one place to cure it. That is all. I do not have another word to say on that.

Mr. KEARNS. But do you not think that Mr. Ford ought to pay some interest on this other \$50,000,000 that the people are giving him? That is the point. Do you not think he ought to pay 4 per cent interest on more than what it requires to complete this plant?

Mr. SILVER. That is not our belief.

Mr. KEARNS. If he had to build it himself, it would cost him that much money.

Mr. SILVER. I grant you that, and he would build a plant that would be suitable and right for his plans at this time. I understand that he has got to spend millions of dollars there to make that plant the kind of plant he wants to have there.

Mr. KEARNS. You mean millions of dollars in the operation of the plant?

Mr. SILVER. Oh, no; in reequiptment and rearrangement, etc.; millions of dollars to put that plant in shape to manufacture in the way he believes it has to be operated to be economical and right to carry out this theory of manufacturing.

Mr. KEARNS. Is not that what he wants the Government to spend this other \$50,000,000 for?

Mr. SILVER. No, sir; after it is turned over to him, he will have to spend that money in order to effect the kind of economies he has in mind.

Mr. KEARNS. Do I understand you to say that he is going to spend this twenty-five or forty million dollars?

Mr. SILVER. Steady; I did not use any amount. I said millions of dollars. I do not hesitate to say that in discussing it with him he intimated it might take between ten and fifteen million dollars to make this plant the kind of production plant that he desired.

Mr. KEARNS. Did he mean he would have to spend that much more on machinery?

Mr. SILVER. On equipment and rearrangement of the plant itself to make it the kind of a fertilizer plant he thinks it must be made to do the real trick.

Mr. KEARNS. I have not heard that testimony, and this is the first time I have heard the statement made.

Mr. SILVER. That may be.

Mr. KEARNS. This is the first time I have heard it said that he was going to spend anything on additional machinery. My impression was he wanted the Government to finance the completion of that plant, ready to manufacture nitrates and furnish power, etc., and if I am wrong I would like to know about it.

The CHAIRMAN. His representatives in appearing before the committee gave it as their opinion that Mr. Ford would have to expend thirty or forty million dollars.

Mr. SILVER. We think so. We think we will have language that will not only be entirely happy to us but we trust will be happy to this committee.

Mr. KEARNS. I think the committee wants to know, if it is going to vote out that amount of money, that the farmers are going to get what they are expecting.

Mr. SILVER. Do not think that the farmers want to take any chance about it. They want to be right sure about it, and they are trying to be sure about it, and they have special committees studying and following up this matter, and they want to know just what you want to know.

Mr. KEARNS. If you are studying the matter along those lines, I think the committee will anxiously await a further report from you on that study.

Mr. SILVER. Before these hearings close, we will have the results of that study brought to you.

Mr. KEARNS. Has your organization ever studied or given any consideration to what this plant would cost to build now? If you should find it in the shape that the Government did a few years ago, when they undertook to build this plant, what would it cost to build it and complete it as Mr. Ford wants it completed?

Mr. SILVER. We have this plant just as it stands not like an interested party would go out and find an unoccupied site on a river bank some place. We approach this as a waste of the war, we might say. Now, we either use it or we do not use it, and it is either used and made an asset of or else it is in a large measure wasted.

Mr. KEARNS. I understand that, but that does not answer my question.

Mr. SILVER. Well, I beg your pardon.

Mr. KEARNS. The taxpayers of the United States have already spent there or had on the first day of last July, \$106,000,000 plus.

Mr. SILVER. Yes; whatever the amount may be.

Mr. KEARNS. \$106,000,000 plus, so the Secretary of War testified here, or in round numbers \$106,000,000. Of course, we will grant that that was done under the stress of war, and that a great deal of that money was wasted and squandered, but the question I would like to have answered is what it would cost to-day to do what the Government has already done down there and to complete the plant as Mr. Ford wants to complete it. How much would that cost?

Mr. SILVER. I do not know.

Mr. KEARNS. Do you not think your organization ought to know how much they are giving Mr. Ford? Mr. Ford agrees to complete it, and he believes it will cost anywhere from forty to fifty million dollars.

Mr. SILVER. Yes.

Mr. KEARNS. And he is to pay 4 per cent on what it costs to complete it.

Mr. SILVER. Yes, sir.

Mr. KEARNS. Therefore, he wants the taxpayers of the United States to give him the \$106,000,000 for his use for 100 years without paying anything on it: is not that true?

Mr. SILVER. By the same reasoning, would we not be glad to turn our Navy over to some one who would keep it in good running shape and turn it over to us in time of war? The fellow who did that would not have a bargain.

Mr. KEARNS. But he is going to use this plant in the manufacture of power and he is going to use it to manufacture parts for his automobile, and will possibly manufacture plows, etc.

Mr. SILVER. Sure; but whether business goes good or bad, he has to still keep that plant in shape to produce these needed chemicals in peace time, under this contract, for agricultural purposes, and be ready in time of war to turn it over to the Government as a going concern.

Mr. KEARNS. But is not the cost of that negligible, compared with the money that the Government has already invested down there?

Mr. SILVER. Not according to some estimates of what it would cost the Government to keep it as a stand-by. Maj. Burns testified it would cost \$2,500,000 to keep it in a stand-by condition, charging depreciation, etc., and if we let it stand as an idle concern in 20 years you have lost it, anyhow.

Mr. KEARNS. Let me ask you this question: If Mr. Ford wanted to go down to Muscle Shoals, and there was nothing built there, but he wanted to go there to build a plant, just as any other business firm would want to do, it would cost him at least \$100,000,000 to build the plant the way he wants it, would it not?

Mr. SILVER. No; not according to your statement, because you said that a great deal of money that the Government spent down there was wasted, and I concur in the statement that war expenditures are always wasteful.

Mr. KEARNS. I mean if the plant is completed down there as he wants it, it would cost him at least \$100,000,000 to build it from the ground up?

Mr. SILVER. I do not know that I am competent to guess on what it would cost, but it would cost a heap of money.

Mr. KEARNS. Certainly there was not more than \$56,000,000 wasted down there, which is cutting it more than half in two.

Mr. SILVER. We are just guessing at that.

Mr. KEARNS. Yes; but we will say that it cost him \$100,000,000, and if that is true, the Government is giving him a subsidy of \$50,000,000, is it not?

Mr. SILVER. Now, may I put that around the other way?

Mr. KEARNS. You do not like the word "subsidy"?

Mr. SILVER. Wait. I am going to let you use the word subsidy. I did not like the word subsidy when it was first mentioned yesterday, but I am going to put it around the other way, and maybe I will think more of it. What kind of a subsidy is the Government giving at the people's expense to the present manufacturers of fertilizer if they do not do this?

Mr. KEARNS. What kind of a subsidy?

Mr. SILVER. Yes; are they not subsidizing them?

Mr. KEARNS. How is that? I do not understand that. You mean they are paying them exorbitant prices for the fertilizer?

Mr. SILVER. Yes.

Mr. KEARNS. I will agree with you about that, and I will agree with you about that as to practically every manufacturer to-day, and on the same theory we are subsidizing every manufacturer because practically all of them are charging more for their wares than they are justified in charging.

Mr. SILVER. You and I agree about that situation—and this is one place to cure it. That is all. I do not have another word to say on that.

Mr. KEARNS. But do you not think that Mr. Ford ought to pay some interest on this other \$50,000,000 that the people are giving him? That is the point. Do you not think he ought to pay 4 per cent interest on more than what it requires to complete this plant?

Mr. SILVER. That is not our belief.

Mr. KEARNS. If he had to build it himself, it would cost him that much money.

Mr. SILVER. I grant you that, and he would build a plant that would be suitable and right for his plans at this time. I understand that he has got to spend millions of dollars there to make that plant the kind of plant he wants to have there.

Mr. KEARNS. You mean millions of dollars in the operation of the plant?

Mr. SILVER. Oh, no; in reequipment and rearrangement, etc.; millions of dollars to put that plant in shape to manufacture in the way he believes it has to be operated to be economical and right to carry out this theory of manufacturing.

Mr. KEARNS. Is not that what he wants the Government to spend this other \$50,000,000 for?

Mr. SILVER. No, sir; after it is turned over to him, he will have to spend that money in order to effect the kind of economies he has in mind.

Mr. KEARNS. Do I understand you to say that he is going to spend this twenty-five or forty million dollars?

Mr. SILVER. Steady; I did not use any amount. I said millions of dollars. I do not hesitate to say that in discussing it with him he intimated it might take between ten and fifteen million dollars to make this plant the kind of production plant that he desired.

Mr. KEARNS. Did he mean he would have to spend that much more on machinery?

Mr. SILVER. On equipment and rearrangement of the plant itself to make it the kind of a fertilizer plant he thinks it must be made to do the real trick.

Mr. KEARNS. I have not heard that testimony, and this is the first time I have heard the statement made.

Mr. SILVER. That may be.

Mr. KEARNS. This is the first time I have heard it said that he was going to spend anything on additional machinery. My impression was he wanted the Government to finance the completion of that plant, ready to manufacture nitrates and furnish power, etc., and if I am wrong I would like to know about it.

The CHAIRMAN. His representatives in appearing before the committee gave it as their opinion that Mr. Ford would have to expend thirty or forty million dollars.

Mr. KEARNS. I remember that testimony, but I thought they meant he was going to leave that in running on his business.

Mr. CHURCHMAN. Yes.

Mr. KEARNS. And what is the intention of Mr. Kearns, inasmuch as he says he wants to get the matter straightened out—

Mr. CHURCHMAN. Yes.

Mr. KEARNS. The Secretary of War said it would require from one and a half million dollars to ten million dollars for additional equipment of plant No. 2 for the production of the nitrate agreed to be produced by Mr. Ford.

Mr. KEARNS. What is this fifty or sixty million dollars that the Government is expected there to be expended on?

Mr. SILVER. You have got to finish the dam, and you have got to do a lot of other things. I do not know that I could answer as to the items. You had better let Mr. Ford's engineer tell you about that.

The CHAIRMAN. According to what the representatives of Mr. Ford said, the Government is expected to provide the money for the completion of Dam No. 2 and the thorough building of Dam No. 3, which has not even been commenced at the present time, and the Government engineers say that will take about \$50,000,000. Mr. Ford thinks it will take about \$42,300,000.

Mr. SILVER. They are talking about the water power in making that statement.

The CHAIRMAN. Yes. On this nitrate plant, the evidence is that Mr. Ford wants to buy that outright. It has cost the Government up to date \$67,000,000 and is practically in working order. It will not require a great deal of money to complete it; Mr. Ford, of course, would have to go ahead with it as it is, but he would like the Government also to buy the flowage rights and the water rights necessary in the construction of Dam No. 3. Of course, the amounts vary in the different calculations of the engineers. The Government engineers are a little higher and provide a little more money than Mr. Ford's engineers. That is the situation that the plant is in at the present time, and that is the testimony before the committee as I recall it.

Mr. SILVER. Yes.

Mr. KEARNS. The Air Nitrates Corporation claims to have certain rights in this plant. Has your organization ever investigated that question?

Mr. SILVER. I do not think our organization has ever investigated as to that. We have the expression of the opinion of the Judge Advocate General, and aside from that they have not done anything about it.

Mr. KEARNS. Would the farmers whom you represent want this contract entered into with Mr. Ford if they knew how we stood with this Air Nitrates Corporation?

Mr. SILVER. Our people are inclined to take the opinion of the Government officials and of the Judge Advocate General to the effect that this is not a valid obligation and that they have no claim.

Mr. KEARNS. I think myself they have no claim, but I wanted to know what your organization thought about it.

Mr. SILVER. So we simply dismiss it with that thought in mind.

Mr. MILLER. Mr. Silver, you went into something of the philosophy of the economic life of the agriculturist.

Mr. SILVER. Yes.

Mr. MILLER. One thing basically that is the matter with the philosophy of the agriculturist or the system under which we do business is that under the present-day methods whatever he buys the other man fixes the price.

Mr. SILVER. Yes.

Mr. MILLER. And whatever he sells the other man fixes the price.

Mr. SILVER. Very true.

Mr. MILLER. In other words, he differs in that respect—

Mr. SILVER. From any other group.

Mr. MILLER (continuing). From any other producer in the world.

Mr. SILVER. That is true.

Mr. MILLER. The Congress undertook to overcome that, as near as it could be done by legislation, by providing for what is known as the cooperative marketing principle.

Mr. SILVER. For which we are very appreciative.

Mr. MILLER. And which, probably, may in future years develop into a corresponding independence of the agricultural producer along the lines of other producers. That is the hope?

Mr. SILVER. Yes.

Mr. MILLER. I think there is no well-poised man in this country, Mr. Silver, but what is interested intensely in agricultural production.

Mr. SILVER. I think that is true.

Mr. MILLER. And friendly toward it, because it is the basic support of the human family. Now, coming down to this concrete Ford proposition, you spoke about your belief that there was a sort of element of philanthropy involved in it, and that Ford is going to do this wonderful thing for the farmers in the production of cheap fertilizers; that is right, is it not?

Mr. SILVER. Yes.

Mr. MILLER. I suppose you have observed that the net result of this contract is that the Government is financing Mr. Ford at the rate of 4 per cent interest, but the product the farmer has to buy he buys at 8 per cent interest?

Mr. SILVER. Not to exceed that.

Mr. MILLER. In other words, Mr. Ford is charging double the amount of interest to the farmer that he pays to the United States Government. There is not much philanthropy in that, is there?

Mr. SILVER. He does not necessarily charge the 8 per cent under the contract.

Mr. MILLER. Tell me where he does not necessarily charge that. I will take issue with you right on that.

Mr. SILVER. It says not to exceed that amount.

Mr. MILLER. Not to exceed 8 per cent.

Mr. SILVER. Yes.

Mr. MILLER. And you folks have a committee to see that it does not exceed that.

Mr. SILVER. That they do not charge in excess of that.

Mr. MILLER. Mr. Ford then is privileged in all that provision of the contract in which you folks are bound, that he can make 8 per cent out of his money.

Mr. SILVER. Now, so far as that—

Mr. MILLER (interposing). That is right, is it not, Mr. Silver?

Mr. SILVER. Just a word. So far as—

Mr. MILLER. Is not that right?

Mr. SILVER. So far as—

Mr. MILLER. That is all I desire to ask, Mr. Chairman.

The CHAIRMAN. As I understand it, Mr. Silver wants to make some explanation.

Mr. MILLER. I asked Mr. Silver twice if that was not right and he did not and would not answer my question, so I am through.

Mr. SILVER. I am trying to answer and I want to answer, but I think that neither yes nor no would be a complete answer, sir.

The CHAIRMAN. I think under the rules of evidence you would be entitled to say yes or no, and then explain what you meant by your answer; I think this question can be answered in that way.

Mr. SILVER. I would say no, then, as to that.

The CHAIRMAN. Then you want to make an explanation of your answer?

Mr. SILVER. Yes.

The CHAIRMAN. I think you would have a right to do that.

Mr. SILVER. There is nothing here requiring the payment of the full 8 per cent, and Mr. Ford, in conversation with me, said, "I would not give that for it to make money out of it," speaking of the fertilizer end of the proposition at Muscle Shoals. "My business has been built up largely by dealing with the farmers of this country."

If I can serve them, and if I can develop a great agricultural foundation there that will be good for all people, I will think my life has been worth while. I do not feel that making money alone makes a good citizen. Now, just a moment further. The 4 per cent which the gentleman refers to is a part of the cost of manufacture, and no interest on the profit. It goes in on that basis, what it costs him, and not as a part of his profit.

In addition, the 4 per cent which the gentleman refers to is invested in water power, in the dam, and that is permanent. This fertilizer is manufactured with machinery on which there is a different degree of depreciation involved. The fertilizer in its cost will just carry the 4 per cent charge against that part of it, whatever part is contributed by it.

Mr. CROWTHER. Mr. Silver, referring to the statement you just made about Mr. Ford producing this fertilizer, let me call your attention to the statement on page 29 of the testimony of Secretary Weeks, which you will find on examination of Mr. Mayo's testimony was not disputed; in fact, he rather acquiesced in the statement. The Secretary says, "but I did suggest that it seemed to me

that there should be a forfeit in case of the failure to carry out that part of the agreement, because in my conversation with Mr. Ford I said to him, 'will you guarantee to continue to manufacture fertilizer during the life of this contract,' to which he replied that he would not. I said, 'will you agree to invest a certain definite amount of money in the manufacture of fertilizer,' and he said he would not. Now, of course, he does, in effect.

"I said then, in effect, 'You might stop the manufacture of fertilizer in five years or in any other time to the great disappointment of the people down there,' and he said: 'Of course, I am going to stop if I can not manufacture it profitably.'"

Has Mr. Ford denied those statements, or have any of those who represent him here made any refutation of those statements?

Mr. SILVER. Not to my knowledge. But if all of that is true, if he should arrive at the place where he discontinues, the purpose would have been accomplished, because if the other groups that are now charging such outrageous prices come in and undersell him, make it so he can not operate, we would have scored a great victory.

Mr. CROWTHER. You are not afraid that anybody would undersell Henry Ford, are you?

Mr. SILVER. Not a bit of it; so he will go right on.

Mr. CROWTHER. Then why suggest it as a contingency?

Mr. SILVER. That would be the contingency under which he would discontinue the manufacture; but I am not uneasy about his discontinuing.

Mr. CROWTHER. In making the statement you appeared to be, but you qualified it immediately. The statement you read yesterday, in addition to its reference to fertilizer, spoke of the development of metals. That was in something you put in the record yesterday, among other things. To what does that refer? Have you any knowledge as to what Mr. Ford intends to develop, so far as metals are concerned, in that particular territory?

Mr. SILVER. I do not know that I have any such definite information that would justify me testifying in reference to that here. I would rather that Mr. Ford or his representative testify to the committee in reference to that. But in conversations with him I could not help but having the impression and belief, and knowing that if he develops manufacturing industries he will need metals, it is my impression that he would develop them. And I illustrated in that way how there could be great savings made.

Mr. CROWTHER. With what metals?

Mr. SILVER. I mentioned steel yesterday in connection with the Pittsburgh plus price, and I used other illustrations. I showed how those things could be made cheaper.

Mr. CROWTHER. Do you mean to tell the committee that he contemplates making steel there?

Mr. SILVER. I used those illustrations in connection with what I said, and I illustrate to-day again with them. I have certain beliefs, but I would not want to testify to this committee in any way that would commit Mr. Ford to anything, because I have no information that would warrant me in going that far.

Mr. CROWTHER. You spoke of one of the difficulties that had confronted the farmer and made his situation almost intolerable, and I believe you said that the protective tariff was one of those things?

Mr. SILVER. I said protective tariffs were class privileges, and they may or may not be justified, but that the tariff is a class privilege just the same. I qualified it by saying I did not mean anything unfriendly, nor did I wish to get into a discussion of the tariff question, but I simply said it was a class privilege that may or may not be justified.

Mr. CROWTHER. Is it not true that the recent improvement in the prices of wool for the sheepman and cattle for the cattleman, and in the dairy products, and the prices of grain at the present time are due very largely to the passage of an emergency tariff bill constructed and passed especially for the benefit of the agricultural interests and at their request?

Mr. GARRETT. Mr. Chairman, if you are going to the tariff proposition—

The CHAIRMAN (interposing). This committee is supposed not to be a political committee.

Mr. GARRETT. But the question asked is a direct political question, and it has been tested out in this very Congress.

The CHAIRMAN. I will tell you, Mr. Garrett, in the past when the Democrats claimed the tariff was doing certain things, we had gotten to a point where

the rations of the men in the Army were double, and there was no tariff involved. But the Democrats, however, made the fight that everything was governed by the action of the tariff. The committee did not look upon that as a political question.

Mr. GARRETT. I know, Mr. Chairman, but the specific question the gentleman asked for the record here, in order to show what the witness's answer would be, was in regard to the advance in the present price of certain farm products and the relation of that to the emergency tariff. For the record of this committee to show that and not to have the record show the decline of all those things immediately following the passage of that bill and for months afterwards is unfair, it seems to me, having the belief in regard to that question that I have.

Mr. GREENE. But you are doing it now.

The CHAIRMAN. They would be justified—

Mr. FIELDS (interposing). Mr. Silver having qualified his statement yesterday, in reference to the tariff, by the qualifying statement that a protective tariff might or might not be justified, a direct political question would not be warranted, because no man can tell from his statement whether he is a protectionist or not.

The CHAIRMAN. I do not think so. That is why I raised no objection to the question.

Mr. GARRETT. I raise no objection to it, and the gentleman who asked the question can suit himself.

Mr. CROWTHER. I have tried to ask a few questions without making speeches in the record.

Mr. KEARNS. Let us have the question read, so that we will know just what it is.

(The question referred to was read, as follows:)

"Mr. CROWTHER. Is it not true that the recent improvement in the prices of wool for the sheep man, and cattle for the cattle man, and in the dairy products, and the prices of grain at the present time, are due, very largely, to the passage of an emergency tariff bill constructed and passed especially for the benefit of the agricultural interests, and at their request?"

Mr. SILVER. There is a difference of opinion among our people on that question.

Mr. CROWTHER. It does not interfere with the concrete result that has been attained?

Mr. SILVER. It does not change the fact at all.

Mr. CROWTHER. Is it not true, along this particular line, in connection with these statements which you have made—

Mr. SILVER (interposing). Is not that true?

Mr. CROWTHER. That the agricultural interests you represent here, as you say, are asking under the permanent tariff bill even greater protection and higher rates than they have under the emergency tariff bill; is that not a fact?

Mr. SILVER. I want to answer that question, but, Mr. Congressman, unless we took the rates as a whole and averaged them, I do not see how I can answer it. My belief is that, in the first place—

Mr. CROWTHER (interposing). You need not answer if you do not want to.

The CHAIRMAN. He was proceeding to answer your question.

Mr. SILVER. No farm groups appeared and testified in reference to the emergency tariff bill, but all of our people were appreciative of the interest Congress took in being helpful. But in connection with the latter tariff we did appear at the hearings, and that was the only instance where we did appear. We asked for certain things to be done. Just how you can compare what we asked for in the hearings at which we actually appeared with the hearings at which we did not appear, I do not know. I can not see how that can be done.

Mr. CROWTHER. I just want to make note of the fact that what you suggest is in the interest of certain classes and has the spirit of class legislation, of preferential legislation; that some legislation is being sought by the agricultural interests, as was exemplified by Mr. Miller's suggestion regarding the farmers' cooperative act, in which the farmers receive exemption from the usual penalties as regards restraints of trade and such things. That is what is provided in the farmers' cooperative act. You are exempted from the penalties that are charged against other organizations that are built up for the purpose of developing their business; is that not true?

Mr. SILVER. No; I do not so understand it.

Mr. CROWTHER. I understand the farmers are exempted under that act.

Mr. SILVER. The farmer has a different understanding. The farmer does not believe he has class or special legislation in that matter. He does not believe he is exempted from the antitrust legislation. He does believe that under the procedure provided there his rights are clarified, but he has no rights above and beyond what other groups have.

Mr. CROWTHER. That is the general understanding of the provisions of the bill, and I think the language is fairly specific in regard to that.

You made a statement regarding electric propulsion of railroads, in which you said that the freight cars moved 14 miles a day as against 7 miles a day under steam propulsion. What electrification of the railroads do you know of that warrants that statement? Does that include only one railroad?

Mr. SILVER. I quoted that specifically yesterday.

The CHAIRMAN. I think, if you will pardon me, in order to save time, the witness testified that it was in connection with some road down here in Virginia.

Mr. SILVER. I testified in reference to the Norfolk & Western Railroad in West Virginia, as to pulling over a high hill, and to the long operations, over 700 miles, of the Chicago, Milwaukee & St. Paul road. I read that specifically into the record.

Mr. CROWTHER. You also made the statement that the farmers pay four-sevenths of the freight charges in this country?

Mr. SILVER. Yes; I got that from Mr. Thorne's testimony before the Interstate Commerce Commission.

Mr. CROWTHER. On what do they pay that? They do not pay the freight on everything grown, do they?

Mr. SILVER. Of course they do; who does pay it?

Mr. CROWTHER. The man who buys it, does he not?

Mr. SILVER. He gives the farmer a check, less the freight charges. Then, when the farmer buys something they ship it to him collect, and he pays at the other end.

Mr. CROWTHER. I have bought a good many cars of barley in my time, and we always paid the freight.

Mr. SILVER. You took it out of the market price.

Mr. CROWTHER. No; we did not.

Mr. SILVER. The farmers do not understand it that way; they may be wrong about it.

Mr. CROWTHER. What State are you from?

Mr. SILVER. West Virginia.

Mr. CROWTHER. I live in New York, and we pay for everything we get there.

Mr. SILVER. There are some mighty good people in New York State, but we are often not happy with the price paid on the New York market, but if you did not pay for it at all we would be most unhappy.

Mr. CROWTHER. When we want to build anything, we raise the money, and we do not ask the Government for a penny. We raised \$200,000,000 with which to build ourselves a canal up there, and we did not ask the Government for a cent.

Mr. SILVER. It was at a hearing on that matter the other day.

Mr. CROWTHER. You spoke of the necessity of fertilizers and the fact that our farms would soon be deserts if something of that kind was not done. In that connection, as I remember, Dr. Whitney testified that the people in several of the European countries do not use fertilizers at all, use nothing except the natural fertilization, and the method of rotation of crops, and that their greatest faith was in their oldest soils. How do you account for that? Is there something lacking in our understanding of the development of the soil of this country?

Mr. SILVER. We have been mining our soils and we have been taking the fertilization out of them at a greater rate than we have replaced fertilizers, greater, possibly, than any other country in the world.

Mr. CROWTHER. You also recollect that he made a statement that after 10 years of fertilization of the soils by synthetic products, they found a growth in the production; that although during the first 10 years there was a gradual growth in the productivity of the soil, after that 10-year period had elapsed it went down in corresponding ratio to the amount of the soil that had no fertilizer.

Mr. SILVER. That is if we use nothing but the synthetic fertilizers; but if you use what you get from the legumes you will have a permanent building up of the soil.

Mr. CROWTHER. You were testifying yesterday in reference to the high cost charged by the manufacturers of fertilizers, and in discussing that you spoke of

the probable costs at a plant where ammonium nitrate is produced, and you spoke of the other products. Then you figured that up to about \$18 or \$20 and told us that the price is \$48 or \$50. Do you think that is a fair comparison, taking the cost of two or three ingredients of the fertilizer and comparing that with the final cost of the finished product?

Mr. SILVER. That included all of the ingredients, plus the labor which made up the finished product.

Mr. CROWTHER. What percentage of the cost, generally, in the case of a finished material, is represented by the labor cost?

Mr. SILVER. I allowed four or five dollars, which is more than it costs us to make fertilizer.

Mr. CROWTHER. What do you mean when you say "us?"

Mr. SILVER. The farmers. We mix fertilizer ourselves sometimes.

Mr. CROWTHER. There was a good deal of criticism on your part in the suggestive statement you made regarding what you called the vicious propaganda distributed around the country against the Ford proposition.

Mr. SILVER. Opposing the development of the Muscle Shoals proposition?

Mr. CROWTHER. Has not that been pretty well or about balanced by the same type of propaganda that has been put out in favor of it and against all the other interests? Do you not think that is about a 50-50 proposition?

Mr. SILVER. There is a difference, is there not, in doing a constructive, helpful thing in developing our national life and in preventing it being done?

Mr. CROWTHER. Of course, that would be discussed from the individual point of view.

Mr. SILVER. Unfortunately—

Mr. CROWTHER (interposing). As to how much of a constructive undertaking this is and how much advantage it is going to be for the agricultural interests of the country is shown by the statement I read at the beginning of my questions as to Mr. Ford's position in reference to the matter, and which has not been denied on behalf of Mr. Ford, that if he could make these things at a profit, he would make them, and if he could not, he would not make them. That is all there is to it. Are you going to put qualifying language in there and make a hard and fast clause that will make it impossible for Mr. Ford to make any such statement as that again, that whenever it does appear to him to be profitable he is going to quit the manufacture?

Mr. SILVER. Of course, we have come to the committee with certain language that we have agreed on, and the committee will have this proposition before it, to decide whether it does or does not want to include it.

Mr. CROWTHER. Do you intend to offer something of that sort?

Mr. SILVER. We will submit what we think will cover the case, so far as the farmer is concerned.

Mr. CROWTHER. Speaking of constructive and destructive methods, you criticized Mr. Rockefeller and held him up as the very antithesis of Mr. Ford, or you held up Mr. Rockefeller's methods as the very antithesis of Mr. Ford's proposition. Is there not some credit at least to be given Mr. Rockefeller's genius in the development of the business he is engaged in?

Mr. SILVER. I think he has great genius. I did not mean to reflect on Mr. Rockefeller's ability. I was simply illustrating the attitude of the two men toward the public.

Mr. CROWTHER. What is the difference in their attitude toward the public?

Mr. SILVER. I tried to make that plain.

Mr. CROWTHER. What has Mr. Rockefeller done that has been detrimental to the public?

Mr. SILVER. He has taken a great natural resource and built up a great fortune, and the methods he used, according to the prevalent belief of the public mind, have been questionable; but they do not question Mr. Ford's methods at all.

Mr. CROWTHER. They do not? Do you know how much Mr. Ford took out of the War Corporation profits that were granted under the Dent Act for what was coming to him?

Mr. SILVER. I do not.

Mr. CROWTHER. You do not know anything about that?

Mr. SILVER. No.

Mr. CROWTHER. I hope to put a photostatic copy in the record in regard to that particular matter to offset some of the statements you have been making in regard to the suggestion about Mr. Ford's philanthropic interest manifested in connection with this particular matter, and at other times. You alleged in a direct statement made by you that Mr. Cooper, the engineer who

appeared before the committee the other day, spoke for the Water Power Trust. By what authority do you make that statement?

Mr. SILVER. I would repeat the same language; that is commonly talked about.

Mr. CROWTHER. Oh, well, that is hardly the explanation one would expect from you regarding a statement of that severity of character regarding a man's standing, or with reference to his services and his appearance as a witness. Have you no authoritative backing for that statement?

Mr. SILVER. If you wish me to, I will file in the record just what official connections I can find which will show the company he keeps.

Mr. CROWTHER. I would be glad to have you do that, and file it directly under the question I asked you, with the statement that this is your explanation of the question in connection with your direct charge that he is the representative of the Water Power Trust.

Mr. SILVER. All right, sir. (See Appendix, p. 1146.)

Mr. CROWTHER. And not have it so that it will appear generally in there, but have it come directly under the question I asked you. I do not know who Mr. Cooper is, but he appeared to be a very competent witness. He was one of the very few men who apparently knew just what he was talking about.

Mr. SILVER. I think he is a very able man.

Mr. CROWTHER. Yes; I think he is. You spoke of the capacity of this plant down there, which you said was going to be operated, according to the contract, to its capacity of 110,000 tons of ammonium nitrate. It has been testified that in order to get that plant in such condition that it would produce ammonium sulphate it would be necessary to put in about \$1,500,000 additional in plant No. 2. That is the testimony of the Chief of Ordnance and several of the other expert witnesses who have testified before the committee. That does not compare very favorably with your estimate of ten or fifteen or sixteen million dollars that would probably be spent on this plant to produce ammonium sulphate.

Mr. SILVER. There may be some difference of opinion on that.

Mr. CROWTHER. It is now an ammonium nitrate plant, and it has been testified that it would require about \$1,500,000 to put in the sulphuric acid unit. You say you use ammonium sulphate in the free state on your orchards?

Mr. SILVER. Yes; that is right.

Mr. CROWTHER. You use that in its free state. If we were to produce that alone, that is the only thing which in the contract is agreed upon as to the production of the equivalent of 110,000 tons of ammonium nitrate—

Mr. SILVER (interposing). Will you say that over again?

Mr. CROWTHER. In the contract the provision is that the plant shall operate at the capacity of the plant, which is 110,000 tons of ammonium nitrate a year.

Mr. SILVER. Yes.

Mr. CROWTHER. That is the equivalent of just short of 200,000 tons of ammonium sulphate. Suppose he produces that according to the contract, then there will be 190,000 tons of ammonium sulphate. Suppose he just makes that, and you could use it on your orchards. He does not agree to make a balanced fertilizer that would be recognized as a plant food.

Mr. SILVER. Of course, that is a plant food; it can be used on some plants.

Mr. CROWTHER. That would really comply with the contract, would it not?

Mr. SILVER. For the production of nitrogen and other fertilizer compounds?

Mr. CROWTHER. Yes.

Mr. SILVER. He would not have complied with the contract until he had produced other fertilizer compounds.

Mr. CROWTHER. He might produce a ton a year; that would comply with that sort of a contract. He might produce a minimum quantity, because there is nothing stated as to the quantity of other fertilizer compounds; it just says to the capacity of 110,000 tons of ammonium nitrate, which is the equivalent of approximately 190,000 tons of ammonium sulphate.

Mr. SILVER. That is the capacity of the plant.

Mr. CROWTHER. Is there any other machinery to be provided there, or does the contract contemplate the installation of any other machinery in preparation for the manufacture of any other kind of fertilizer compounds?

Mr. SILVER. That is what he is going to spend the additional millions for.

Mr. CROWTHER. You say that is what he intends to spend the additional millions for?

Mr. SILVER. Yes; he will do lots of things, perhaps, that are not in the contract. He is going to do things; he would not make the great investment he is going to make if he were going to break the contract.

Mr. CROWTHER. Do you think he would make such an investment if the total horsepower was to be limited to another 100,000 horsepower over the amount of primary horsepower to be developed at dam No. 2 now?

Mr. SILVER. The only way by which I can judge what he will do is by his tender. He states the conditions.

Mr. CROWTHER. He does not agree to do anything.

Mr. SILVER. I have no authority to speak for Mr. Ford.

Mr. CROWTHER. If you have not had some vision or some assurance of what may be accomplished, how can you in good conscience advocate before this committee so strongly the taking up of this proposition? You surely must have at least some vision or some idea which you must have gained from your conversations with him, even though you may not have any specific knowledge, as to the realization of these things you have been talking about. You have paid a very glowing tribute to Mr. Ford's genius, but you can not hitch his genius into a contract. You have some other impossible language in there and you might get a clause in there to the effect that the farmers may have cheap fertilizer, and believing in the genius so far displayed in business operations by Mr. Ford, we hereby subscribe ourselves to do such and such a thing.

Mr. SILVER. If you contract with genius and he undertakes to do a thing you are certainly hooking genius up into the carrying out of the contract.

Mr. CROWTHER. Yes; but, ordinary genius is largely 95 per cent perspiration, and most of the time hard work. Are you a farmer?

Mr. SILVER. I can qualify there; I am a farmer.

Mr. CROWTHER. With that I will close, Mr. Chairman.

Mr. WURZBACH. Mr. Silver, what is your idea about requiring security of Mr. Ford or this company he is going to form in the event of the acceptance of this offer; that is, in the performance of all obligations to make the payments as provided for, of 4 per cent, and the amortization payments and the obligation to make fertilizer? What is your idea and the idea of the organizations you represent with reference to requiring security or guarantees for the faithful performance of those obligations?

Mr. SILVER. I have no suggestions, speaking for our people, in reference to that matter of additional pledges, other than what he makes in this contract.

Mr. WURZBACH. What security do you think this offer now furnishes to the Government and to the farmers?

Mr. SILVER. It certainly carries security with it, if this tender is accepted; if he invests a great amount of money he must keep it in good faith, or legal procedure will lie against him or his company. He contracts with the Government to do certain things, and then section 18 of the contract provides "as a method of procedure in the event of the violation of any of the terms of this proposal or any contracts made in furtherance of its terms, the company agrees that the Attorney General may, upon request of the Secretary of War, institute proceedings in equity in the district court of the United States for the northern district of Alabama, for the purpose of canceling and terminating the lease of Dam No. 2, or Dam No. 3, or both of them." He has a great investment there, and he must keep not only good faith but he must live up to his contract.

Mr. WURZBACH. That is what he obligates himself to do. I understand that part of it.

Mr. SILVER. The penalty of cancellation is provided.

Mr. WURZBACH. You think that is the only penalty, the cancellation of the contract?

Mr. SILVER. It would seem to me if you canceled the lease and took away the water power you would have done plenty. If you take away the water power, what power would he have with which to operate these industries?

Mr. WURZBACH. He might violate his contract before he had put up any very valuable improvements. Do you not think there ought to be some additional security, certainly covering the period after the death of Mr. Ford?

Mr. SILVER. The contract binds his estate and binds the company or its successors. It carries right on through.

Mr. WURZBACH. If there was no violation up to the time of his death?

Mr. SILVER. You could proceed against the company after that.

Mr. WURZBACH. What is the company? That is what I am trying to get at. We do not know whether this will be another \$1,000 corporation like the Air Nitrates Corporation, or a \$5,000 or \$10,000 corporation. Do you not think we

ought to have some assurance from Mr. Ford that a company will be organized with a certain amount of paid-up capital stock, or give some bond to the Government that he will or that the company will faithfully perform the obligation assumed in this offer?

Mr. SILVER. To my mind, when he says here "violation of any of the terms," that is sufficient protection. Now, then, his engineer testified that he is going to invest \$30,000,000 or \$40,000,000 or \$50,000,000, whatever the least figure may be.

Mr. WURZBACH. What is the least figure?

Mr. SILVER. Thirty or forty million dollars.

Mr. WURZBACH. He would not invest that in the next three or four years, certainly not during the time the Government is expending its \$50,000,000. During that time he would not have expended that?

The CHAIRMAN. Will you allow me to make this suggestion? I understand Mr. Ford has come to some conclusion about the amount of money that the company ought to be organized for, and I think his representative will be willing to come before the committee and make some statement in regard to that.

Mr. WURZBACH. That has always been the big question, in my mind, and I shall be very glad to hear the statement of Mr. Ford's representative.

(Thereupon the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

The CHAIRMAN. We will continue from where we left off when we recessed at noon, and Mr. Fields will ask you some questions, Mr. Silver.

STATEMENT OF MR. GRAY SILVER—Resumed.

Mr. FIELDS. Mr. Silver, Mr. Miller referred to the fact that Mr. Ford was proposing to charge an 8 per cent profit, or not to exceed an 8 per cent profit, on his manufactured fertilizer product at Muscle Shoals, whereas he was only paying 4 per cent upon the money. The farmers of the country thoroughly understand, do they not, that there is a difference, and in the nature of things must necessarily be a difference, between the profit of manufacture and the profit in lending money, by reason of the hazard in the former and the security in the latter?

Mr. SILVER. The farmers will not be confused about that.

Mr. FIELDS. It seemed from the question that he was attempting to combine two propositions that you can not combine at all because of their very nature.

Mr. SILVER. Yes; he was confusing the interest on the Government's debt, which goes in as a part of the cost and which will be charged into the manufacturing in making up the price, with the manufacturing profit in the sale.

Mr. FIELDS. Mr. Kearns has referred, as other members of the committee have, to the fact that there was nothing in the contract to bind Mr. Ford to manufacture so much complete fertilizer, which I think you very thoroughly explained.

Mr. SILVER. Yes.

Mr. FIELDS. But it seems from the questions that have been propounded that some gentlemen have not gotten the fertilizer proposition clearly in their minds. It seems that they look upon the bag of completed fertilizer that they refer to as containing 100 per cent plant food, and thereby they become confused about the difference between the plant food in a bag of fertilizer and the bag of fertilizer itself.

Mr. SILVER. Yes.

Mr. FIELDS. We will take this bag of tobacco I have here, which belongs to my friend Mr. Quin, as an illustration, and we will say that that represents a 100-pound bag of 2-8-2 fertilizer, the complete fertilizer that they refer to. I use 100 pounds because it is more easily figured out, while, of course, the fertilizer, as a rule, is packed in bags of 125 or 150 or 160 pounds. We will say that this bag contains 100 pounds of 2-8-2 complete fertilizer. That would mean 2 per cent of nitrogen or ammonia.

Mr. SILVER. Yes.

Mr. FIELDS. Eight per cent of phosphoric acid, and 2 per cent of potash which would be 12 pounds or 12 per cent of plant food.

Mr. SILVER. Yes; out of the 100 pounds.

Mr. FIELDS. Yes; which is the only plant food value in the 100 pounds.

Mr. SILVER. Right.

Mr. FIELDS. The remainder of it, 88 pounds, is filler.

Mr. SILVER. Yes.

Mr. FIELDS. Which may be made of sand or various other things, and has no plant-food value and is only dead weight. Its only value is the convenience to the farmer in applying it to the soil under our present methods of application to the soil.

Mr. SILVER. Yes; that is right. We have to pay freight on it and there is no advantage in any way except that is the form we get it in.

Mr. FIELDS. Therefore, approaching this from the standpoint of plant food in which the farmer is interested, because he is not interested in the dead weight, because it brings no value, we might then refer to the Muscle Shoals proposition as a plant-food proposition instead of a fertilizer proposition.

Mr. SILVER. Yes.

Mr. FIELDS. Then, if Mr. Ford manufactures there 190,000 or 200,000 tons, in round numbers, of ammonium sulphate, which is a plant food, it is fair to assume, first, that he is going to market it.

Mr. SILVER. Yes; or why would he manufacture it.

Mr. FIELDS. It would be unfair to assume he was going to manufacture it and throw it into the river, as I suggested the other day.

Mr. SILVER. Yes.

Mr. FIELDS. He must continue under the terms of his contract to produce it.

Mr. SILVER. Yes, sir.

Mr. FIELDS. Then he must find a market for it. What is its peace-time market other than as a plant food?

Mr. SILVER. Fertilizer is the great market.

Mr. FIELDS. It is plant food, then?

Mr. SILVER. Certainly.

Mr. FIELDS. Then I ask what is the peace-time demand for that product other than as a plant food? It is very light, is it not?

Mr. SILVER. It is very small, practically none.

Mr. FIELDS. Then, in specific terms, the contract provides for ammonium nitrate and other fertilizer products, and we have there a basis of 190,000 or 200,000 tons of plant food in the form of ammonium sulphate to start with, and we also have another provision in the contract which refers to other fertilizer products.

Mr. SILVER. Yes.

Mr. FIELDS. And if Mr. Ford produces the amount of phosphoric acid necessary to take its place along with this amount of ammonium sulphate, the farmer then has gained that much additional.

Mr. SILVER. Yes.

Mr. FIELDS. And if he produces the potash necessary to take its place along with this, he has made an additional gain.

Mr. SILVER. Correct.

Mr. FIELDS. That was my understanding of the proposition, and I wanted to know whether my understanding was right or wrong.

Mr. SILVER. That is right.

Mr. FIELDS. I inferred from one question propounded by Mr. Crowther that he had the impression that the natural fertilizer referred to by Dr. Whitney might be had by the farmer without any cost to him. I agree with Dr. Whitney that it is probably the most valuable fertilizer that we can have, but I would not agree with Dr. Crowther—or my understanding of his statement rather—that the farmer could get it without cost. In fact, in many instances, is it not the most expensive fertilizer per acre we could possibly get?

Mr. SILVER. It is the most expensive.

Mr. CROWTHER. Mr. Chairman, I was interrupted and I beg to interrupt there, because I made no such statement as that.

Mr. FIELDS. I referred, Mr. Chairman, to my understanding of Mr. Crowther's statement. I did not quote it as a positive statement, but as my understanding of his statement, and my remarks will show that in the record.

Mr. SILVER. The plowing up of a field and sowing it in a legume, whether it be cow peas or soy beans or alfalfa or whatever it may be, is an expensive process, and costs a great deal of money for the amount of nitrogen that you may capture from the air in that way. That is nature's way, and we are doing a great many things different from the way nature does them, in order to accomplish the same end. We are now setting up a machine or factory to extract this material from the air and get it in what we hope is a cheaper form and in very much greater volume, because if you cut down the production of food-

Shoals is too big for most individuals or firms, and is now selling it out for the Government on a 50 per cent commission, which will probably bring a net return to the Government of around 5 per cent.

Mr. SILVER. Yes.

Mr. FIELDS. Mr. Ford offers \$5,000,000 for the property at Muscle Shoals, which cost the Government \$85,423,078.73, which is 5.85 per cent of its cost, or which is 1.43 per cent more than the Old Hickory Plant brought and more than any other property has brought up to this time on which I have been able to secure the figures. Therefore, granting that it is a subsidy, Ford is not attempting to put over an iniquitous scheme upon the Government, apparently, but is buying its property at a greater percentage of its original cost than anybody else thus far has paid for such property, and the farmers all understand that.

Mr. SILVER. He is doing that, and at the same time developing a natural resource in the most desirable and helpful way.

Mr. FIELDS. Yes.

Mr. SILVER. In addition to buying it and paying as much as has been paid for other plants, he uses it to a better purpose.

Mr. FIELDS. Yes. Now, so much for that part of the subsidy. The War Department and the Congress seem to be practically of one mind about the fact that nitrate plant No. 2 should be kept for the use of the Government for the production of nitrogen in time of war.

Mr. SILVER. Yes.

Mr. FIELDS. And so far as I know, there is no opposition to that among the farmers of the country.

Mr. SILVER. No; none at all.

Mr. FIELDS. It seems to be the unanimous opinion of the citizenship of the country, regardless of class, that the Government should follow that course.

Mr. SILVER. Yes.

Mr. FIELDS. The complaint is made that Mr. Ford does not propose to pay 4 per cent upon the entire investment of the Government necessary to the operation of these dams and the nitrate plant. The Government has now invested in Dam No. 2 \$17,000,000 that is not covered by Mr. Ford's proposal to pay interest.

Mr. SILVER. Yes.

Mr. FIELDS. But as a balance against the interest that that would bring, Mr. Ford proposes to maintain the plant.

Mr. SILVER. Yes.

Mr. FIELDS. Which, according to the figures that have been presented at these hearings, if I have read them correctly, standing alone, would cost around \$200,000 a year to maintain. It cost, I believe, \$201,847. In addition to that, Mr. Ford must bear the expense of deterioration.

Mr. SILVER. Certainly.

Mr. FIELDS. Which, according to the figures of the War Department, basing it upon 5 per cent annually, would amount to \$2,350,000 a year.

Mr. SILVER. Yes.

Mr. FIELDS. Or \$235,000,000 during the life of the lease. In addition to that, with the completion of these dams, the Government is saved the expense of operating the Muscle Shoals canal.

Mr. SILVER. Yes.

Mr. FIELDS. Which has cost the Government an annual charge of \$53,000 since its construction. I notice the War Department does not put it at that much, due to the fact that they are taking the figures of last year when the canal was not in operation at all by reason of the uncompleted condition of Wilson Dam, which obstructs all traffic.

Mr. SILVER. Yes.

Mr. FIELDS. But the average cost has been \$53,000 per annum, which for the life of the lease would be \$5,300,000, or a total for those three items of \$260,300,000 saved to the Government against its \$17,000,000 investment in the dam up to date.

Mr. SILVER. That is quite true.

Mr. FIELDS. I think the farmers of the country would accept that as a very good deal for the Government, would you not think so?

Mr. SILVER. Certainly. In private life, one would think so, if they had that kind of a trade on; but in addition to that, he does applicational research and keeps the equipment abreast of the times by replacements.

Mr. FIELDS. I referred to the replacement cost in the \$235,000 a year.

Mr. SILVER. But the replacement simply to maintain it at its status quo would not be keeping abreast of the times. He will need sometimes to junk perfectly good equipment so that new processes may be applied.

Mr. FIELDS. Yes; I had not taken into account such new processes.

Mr. SILVER. So it is even more than what you mention, and just how to measure that in dollars would be very difficult.

Mr. FIELDS. Then of the amount to be expended from this time on, Mr. Ford agrees to pay \$55,000 a year, first, for the maintenance of the locks and dams, etc.?

Mr. SILVER. Yes; for the operation of them.

Mr. FIELDS. Which, during the lease, would be \$5,500,000.

Mr. SILVER. Yes.

Mr. FIELDS. He will pay interest at the rate of 4 per cent which, upon the figures presented by his engineers, will amount to \$161,040,000, making a total income to the Government in those two items of \$166,540,000.

Mr. SILVER. Yes. There is some interest included there, and I would like, if I may, to insert from the statement of the public debt of the United States a list of the interest-bearing debts of the Government so that it may show what rate of interest the Government has paid in peace times, which would be some reasonable basis for figuring what it would pay in ordinary peace times.

Mr. FIELDS. Yes; I would be very glad to have that put in the record.

(The statement referred to is as follows:)

Bonds.	Amount issued.	Amount retired.	Amount outstanding
4 per cent consols of 1930.....	\$846,250,150	\$46,526,100	\$899,721,000
2 per cent loan of 1925.....	162,315,400	43,825,500	118,489,900
2 per cent Panamas of 1916-1936.....	54,631,980	5,677,800	48,954,180
3 per cent Panamas of 1918-1938.....	30,000,000	4,052,600	25,947,400
3 per cent Panamas of 1961.....	50,000,000		50,000,000
2 per cent conversion bonds of 1946-1947.....	28,894,500		28,894,500
2 1/2 per cent postal savings bonds, first to twenty-first series.....	11,774,020		11,774,020

Mr. FIELDS. Then, Mr. Ford proposes an amortization fund which, retired at 4 per cent, would amount to \$49,000,000 at the expiration of the list.

Mr. SILVER. Yes.

Mr. FIELDS. Which, all combined, would represent in cash actually paid to the Government or expended by Mr. Ford in the maintenance of this plant and by saving the Government the expense of operating the canal, a grand total of \$475,840,000.

Mr. SILVER. They seem to be correct figures, but some of it, however, is interest on investment.

Mr. FIELDS. I referred to that. The \$166,540,000 is interest, the \$49,000,000 is the amortization fund, and the balance of it is the \$260,300,000 in the savings on maintenance, etc.

Mr. SILVER. Yes; that is correct.

Mr. FIELDS. If the Government should be able to retire this amortization fund at 5 per cent, that would amount, at the expiration of the lease, to \$100,868,642, which would be an additional gain to the Government of \$51,797,707.

Mr. SILVER. Yes.

Mr. FIELDS. How would 5 per cent compare with the market for farm loan bonds at this time?

Mr. SILVER. Farm loan bonds at this time carry that rate of interest.

Mr. FIELDS. And I have heard that some people have made application for them and were not able to get them.

Mr. SILVER. People have not only applied for the bonds and could not get them, but at the time of the sale of the \$40,000,000 bond issue, there was more than \$40,000,000 asked for by one of the 12 banks of the system. So that not only is there a demand for the bonds but there is also a demand for the loan. So that in either instance the money could be well loaned and at that rate.

Mr. FIELDS. So, while I said in the beginning that for argument's sake I would concede that there was a subsidy, coming back now to my opinion, it seems to me that instead of the Government extending a subsidy in this case, it is making a trade with Mr. Ford which is the most favorable trade the Government has ever made with an individual in the United States.

Mr. SILVER. I believe so.

Mr. FIELDS. For the reason that this plant is not to be converted by the purchaser solely to his own use without giving any consideration to the interests of the Government, but plant No. 2 is to be maintained at this enormous expense by Mr. Ford for the benefit of the Government in time of stress, should the Government need it.

Mr. SILVER. Yes; it is.

Mr. FIELDS. I believe that is all, Mr. Chairman, and I will admit that these questions are not very pertinent to the Washington representative of the farm bureau, but were more for the purpose of getting a statement in the record to meet such suggestions that have been made here from time to time.

The CHAIRMAN. The chairman of the committee has repeatedly asked that we confine ourselves to the questions involved in Mr. Ford's proposition, but the members of the committee have seen fit to go outside of that and ask about everything else, and I am not stopping anybody.

Mr. FIELDS. Yes; and because that has happened and some statements have gotten into the record that need to be answered, I have answered them with these figures.

The CHAIRMAN. Well, go as far as you like.

Mr. FIELDS. Thank you, Mr. Chairman, I am through.

Mr. QUIN. Mr. Silver, the 21 men on this committee know who you are and for whom you are speaking, but there are 421 gentlemen on the floor of the House who are our colleagues. Now, you are president of the Federation of Farm Bureaus, is that the title?

Mr. SILVER. Not guilty.

Mr. QUIN. What is the position you hold?

Mr. SILVER. J. R. Howard, of Iowa, is the president. I am the Washington representative.

Mr. QUIN. You are what they call the legislative representative?

Mr. SILVER. Well, my title is the Washington representative. I am a member of the executive committee and a director from the State of West Virginia.

Mr. QUIN. How many organizations directly belong to the Farm Bureau Federation or whatever you call your organization?

Mr. SILVER. I would answer that question by saying that we have more than 1,500 and upward of 2,000 county organizations which are federated into 46 State federations, and those 46 State federations are federated into the American Farm Bureau Federation, or the national association.

Mr. QUIN. Does the Farmers' Union belong in that group?

Mr. SILVER. No; that is another organization.

Mr. QUIN. I used to belong to the Farmers' Alliance, but that is now out of existence.

Mr. SILVER. Yes, sir; that is the one we were discussing the other day.

Mr. QUIN. We busted the jute trust. They tried to rob us on our cotton bagging.

Mr. SILVER. Right.

Mr. QUIN. Now, in the United States there are between six and seven million farmers, are there not?

Mr. SILVER. Yes; according to the census.

Mr. QUIN. And the great majority of those farmers are represented through your organization, directly and indirectly?

Mr. SILVER. Yes, sir.

Mr. QUIN. Now, we have many types of farmers. You are a practical farmer yourself, are you?

Mr. SILVER. I am.

Mr. QUIN. We have the landlord with his broad acres, with a big house sitting up in the grove and cattle on a thousand hills. He is an agriculturist farmer.

Mr. SILVER. Yes; some have labeled him in that way.

Mr. QUIN. And then we have the farmer who produces cotton or grain, and so on, on a large scale.

Mr. SILVER. Yes.

Mr. QUIN. Now, about 90 per cent of th's great number of farmers who with their own hands and with the efforts of their good wives and children cultivate from 15 to 50 acres, is not that true?

Mr. SILVER. Yes; but I would put the acreage a little larger than that. The Government saw fit, when it split up the western domain, to make the unit about 160 acres, and I would say from 20 or 25 acres to 160 acres.

Mr. QUIN. The great majority of them have about that amount?

Mr. SILVER. Yes.

Mr. QUIN. That is the man who has a few beehives sitting out there in the yard and hen nests in the back yard?

Mr. SILVER. Right.

Mr. QUIN. And he works all day, from daybreak until dark.

Mr. SILVER. Yes.

Mr. QUIN. And we have even gone out after supper and picked cotton in the moonlight. Some of them do that?

Mr. SILVER. Yes.

Mr. QUIN. They work all day, and some of them, in certain seasons of the year, build a torch in the fields so they can see to work among their vegetables.

Mr. SILVER. True.

Mr. QUIN. Then the farmer is not any 6-hour or 8-hour-day man, is he?

Mr. SILVER. No. The joke is that he is an 8-hour-day man, eight hours before dinner and eight hours after dinner.

Mr. QUIN. And works about 13 months in the year.

Mr. SILVER. That is right.

Mr. QUIN. Now, that class of men and their families, who really produce about 90 per cent of the farm produce in certain periodicals, are called at times "one gallus" farmers.

Mr. SILVER. They have been labeled that way by some.

Mr. QUIN. Now, you represent the big man with his broad acres and the "one gallus" man, as he is termed.

Mr. SILVER. Yes.

Mr. QUIN. All of them come in and have a privy of interest in this subject here.

Mr. SILVER. That is true.

Mr. QUIN. In this proposition submitted by Mr. Ford have you heard of a single dissenting voice, not only from any organization but from any individual farmer?

Mr. SILVER. I have not heard of any farmer dissenting. They are all in favor of it.

Mr. QUIN. Is it not a fact that they all stand up and with one accord proclaim that they think this is a good thing?

Mr. SILVER. They do.

Mr. QUIN. How do you account for the fact that there is such a unanimity of sentiment among that class of our citizenship, which I think constitutes the backbone of the country. Is it because it is a bad thing, as some suggest?

Mr. SILVER. They believe it to be a good thing, and believe it is freeing them from bad practices that other groups have wished on them in the past, and they want to get away from unhappy conditions which have existed, and this is a method by which they think they can do that, and they think it is a helpful thing.

Mr. QUIN. And here is one man who has come forward with a proposition to take this waste project that Congress refused to finish by its vote on the 7th of February, 1921; this man comes forward with a proposition for the completion of the work by the Government, to capitalize it, and make this fertilizer as the farming class believe at a cheaper and more economical price than it is distributed to them at present.

Mr. SILVER. That is true.

Mr. QUIN. Are you acquainted with the farm demonstration agents and cooperative purchasing and selling in the different agricultural sections?

Mr. SILVER. Yes.

Mr. QUIN. This fertilizer, if produced, just like this contract says—and so far as I am concerned, I do not care whether they change a word in it or not—but that fertilizer, if put up in a concentrated form, will have only one-fifth of the weight of the commercial fertilizer that we buy in sacks now: is not that true?

Mr. SILVER. There will be a great saving in the freight and in the bulk.

Mr. QUIN. Is it not a fact that the commercial fertilizer factory gets the concentrated product just like Ford could produce it down there, and they go out and buy sand or earth, a very heavy product, haul it in, and pay for all that expense to mix it properly with their sulphate of ammonia or other nitrogenous products or with potash products, or the other product that is in fertilizer that we call phosphoric acid?

Mr. SILVER. Not necessarily sand. They have a filler which carries this plant food. It comes in different forms. I am not a fertilizer manufacturer, but they have a carrier which carries these elements of plant food.

Mr. QUIN. In my country it is mostly sand.

Mr. SILVER. That may be.

Mr. QUIN. Then, if it be ground rock or sand, the phosphoric acid—the potash and the nitrogen—is absorbed on the outer surface of that sand in the mixing, is it not?

Mr. SILVER. You had better talk to somebody who is better informed technically than I am as to the mixing processes, Mr. Quin.

The CHAIRMAN. Mr. Quin, if you will allow me, I think that has been testified to at least a half dozen times in the hearings.

Mr. SILVER. And my assistant, Mr. Bower, will go into the technical side of it when I am through, and he can answer that question better than I can.

Mr. QUIN. This product could be distributed under the agency that is provided for here—through these cooperative purchasing agents, under the direction of the farm demonstrator of the county, which the county pays for?

Mr. SILVER. Yes.

Mr. QUIN. Then, there is already the machinery set up for the acquisition of this product of Muscle Shoals and its distribution directly to the farmer?

Mr. SILVER. Yes.

Mr. QUIN. And a few farmers, two townships of them, can get a carload or two carloads, or whatever they please?

Mr. SILVER. Yes.

Mr. QUIN. Then, the question of whether or not Mr. Ford would put this in with the sand or ground rock and have 2,000 pounds to be shipped, wherein four or five or certainly not over six hundred pounds would carry all the fertilizer, would be an expensive method, would it not?

Mr. SILVER. The least weight we can have to carry, the commercial plant food, of course, the greater saving in freight and handling and in every other way, and one of the economies contemplated is to save in weight under this process; that is, to get the same amount of plant food with less weight to carry and handle.

Mr. QUIN. Certainly. This number of farmers that we have in the United States, according to the statistics we have, owe on their farms about \$8,000,000,000. That is the amount of the mortgages on such real estate.

Mr. SILVER. Yes; around \$7,000,000,000, I believe; the estimate is under the last census.

Mr. QUIN. That industry, although they work hard, has not been a profitable one, then, has it, for the last few years?

Mr. SILVER. No; it has not.

Mr. QUIN. And if there is a prospect of that basic industry of the United States receiving at the hands of Congress legislation that fundamentally will enable them to produce more per acre at a less cost, is it not advisable?

Mr. SILVER. It is advisable not only for the farmer's sake but for the consuming public.

Mr. QUIN. And it is not class legislation, because all the public is directly interested.

Mr. SILVER. Absolutely not; nor are any other of the measures we have asked for, or those you have kindly granted to us, been class legislation in any sense.

Mr. QUIN. Certainly not, in my judgment; although it is said by some to be that. This contract that Mr. Ford has offered to the Government meets with the approval of the people you represent?

Mr. SILVER. It does.

Mr. QUIN. Some gentlemen asked you about the guaranties. You consider the investment Mr. Ford is making there of his own capital, and knowing his disposition, you consider that guaranty sufficient to insure this fertilizer being produced.

Mr. SILVER. We think the terms of that contract are sufficient; yes.

Mr. QUIN. One gentleman doubted the statement that the farmers pay four-sevenths of the freight in the United States. Let us trace that for the record. All of the agricultural products must go to a market, must they not?

Mr. SILVER. They certainly must, except those that are consumed on the farm.

Mr. QUIN. And most of it must travel on railroads or on steamboats, must it not?

Mr. SILVER. Certainly it must.

Mr. QUIN. It goes to the consumer, and the farmer can not fix the price of his product, can he?

Mr. SILVER. No.

Mr. QUIN. His potatoes and his wheat and his corn and his cotton and his tobacco must accept what the world's demand allows him; is not that true?

Mr. SILVER. That is very true.

Mr. QUIN. Then, when it gets to its destination, the warehouse charges, the freight, the insurance, and the handling are all charged against the product that the farmer has put up?

Mr. SILVER. True.

Mr. QUIN. Then he pays the freight on that stuff to the consumer. He pays it to the factory that puts up the raw material, because that adds to the price of it.

Mr. SILVER. He certainly pays it to the controlling market. To illustrate with wheat, Liverpool makes the price of wheat. We certainly pay on that wheat delivered to Liverpool, whether it goes to Liverpool or not.

Mr. QUIN. The man who gets his cotton out of his field, gets it to the gin, has to pay for ginning it; he has to pay the cotton broker's fee for selling it; he has to pay the warehouse charges; he has to pay the freight, and two-thirds of it goes across the high seas.

Mr. SILVER. Yes.

Mr. QUIN. He pays the freight on it and all the expenses until it is turned over to the spinner in the foreign country, is not that true?

Mr. SILVER. Yes.

Mr. QUIN. Now, then, the man who produces that cotton must have fertilizer. They are growling here about Mr. Ford paying the Government 4 per cent. The man who must have fertilizer will have to pay that 4 per cent, will he not?

Mr. SILVER. Certainly.

Mr. QUIN. And if it was 10 per cent, the farmer would have to pay that excess 6 per cent, would he not?

Mr. SILVER. Yes.

Mr. QUIN. Now, he pays the freight on all of the equipment that he must have on his farm, does he not?

Mr. SILVER. Certainly; he does.

Mr. QUIN. The factory makes that stuff and it goes to the farmer and he is bound to pay the price plus the freight.

Mr. SILVER. Yes; the factory price plus the freight.

Mr. QUIN. Then there is not anything astonishing about the statement that the farmers are paying four-sevenths of the freight paid in the country.

Mr. SILVER. The hearings of the Interstate Commerce Commission give that in very much detail and follow it through in a very complete way.

Mr. QUIN. I never knew before that that was true, but I can see how that would be so with the great number of people involved, and if those farmers were to go on a strike for 6 months all of us city fellows would starve to death; would we not?

The CHAIRMAN. What city do you come from?

Mr. QUIN. I am living here in Washington.

The CHAIRMAN. You say "us city fellows," and I was just wondering what city you came from.

Mr. QUIN. McComb city, and we do not farm in that city. We live off of the farmers and all towns have to live off of them. We know that.

Mr. SILVER. During the war period, when a meeting was called of the housewives league in the city of New York, Mr. Scrivens, the president of the New York State Federation, was on the platform and was talking about what was involved in food production. He was interrupted by a lady on the platform who said, "We know you farmers are profiteering, and if you do not quit your profiteering, we are going to get our food some place else." Just what she had in mind, I do not know, but unless you do like that lady said, you would rely on the farmers of the United States, which is the Egypt at this time of the world.

Mr. QUIN. I have no doubt that some of them believe the farmers profiteer, but as a sample of that my ancestors have been farming for two or three hundred years, and before the war they were big plantation holders, but by the time it got to me I was a "one gallus" farmer. The farmer, working the number of hours you have stated, a great many of them, have to wear patched and shabby clothes, do they not?

Mr. SILVER. Indeed, they do.

Mr. QUIN. And it is not from choice, is it?

Mr. SILVER. It certainly is not, and the patched and shabby clothing is only a little part of it. They would like to send their children to better schools and they would like to have better homes, and would like to have better equipment in their homes. There are just lots of them they would like to have, and they labor long and hard so that they might have just the simplest of comforts and foodstuffs.

Mr. QUIN. And there are thousands of farmers all over the United States who are not able to have shoes for their children in the wintertime.

Mr. SILVER. A great many of them do not have them, particularly at this time.

Mr. QUIN. Mr. Silver, they seem to doubt Mr. Ford's feelings for the people. He manufactured these automobiles you were talking about and started in with nothing. Did he have to have anybody else to lower the price for him or did he do that voluntarily?

Mr. SILVER. He did it voluntarily.

Mr. QUIN. As soon as the war was over, did he not announce a great deal lower price for his automobiles, and tractors, and trucks?

Mr. SILVER. That was the first place where prices were reduced.

Mr. QUIN. And he reduces the prices on farm tractors, and trucks, and cars periodically and sometimes before they wake up in the morning the agencies have notice of some reduction. They did that last fall, did they not? -

Mr. SILVER. Yes.

Mr. QUIN. He has on the market to-day the cheapest tractor a man can run, and that one little gasoline engine can run as many plows as 9 Negroes and 18 mules day after day.

Mr. SILVER. I do not know about that application of it but he has a good tractor that does do the work, and it is by odds the cheapest one in dollars on the market.

Mr. QUIN. And nobody through competition forced him to do that, did they?

Mr. SILVER. No. Because it was the cheapest tractor before he made this last reduction, which was a very material one.

Mr. QUIN. Then with that necessity for the farm, on his own volition, being put down in price, have you any reason to believe that he would pursue a different policy with reference to fertilizer at this activity at Muscle Shoals?

Mr. SILVER. None on earth. We believe he would pursue that course.

Mr. QUIN. Certainly; that is all.

The CHAIRMAN. I see that McComb City has 2,386 inhabitants. I congratulate you on being a big city man.

Mr. QUIN. That is an old census. We have grown now to 10,000.

The CHAIRMAN. This is the United States Official Postal Guide of July, 1921.

Mr. QUIN. That is wrong. The population is 10,000.

Mr. WRIGHT. Mr. Silver, you have been carried over a good, long, broad field yesterday and to-day, and I believe you touched on agriculture and finance and law and chemistry, and divers other subjects, including political and economic questions. You have been asked repeatedly here about sections 14 and 15 of this Ford offer, and especially in reference to article 15, which provides that "in order that the farmers may be supplied with fertilizers at fair prices and without excessive profits, the company agrees that the maximum net profit which it shall make in the manufacture and sale of fertilizer products at nitrate plant No. 2 shall not exceed 8 per cent of the actual cost of production thereof." etc. The special feature I want to invite your attention to is the appointment of this board to supervise this fertilizer industry. Do you not understand that the members of this board would be in the nature of trustees for the farmers?

Mr. SILVER. Yes; they would be the board that would carry out that part of the agreement and would be in the nature of trustees.

Mr. WRIGHT. Now, suppose these organizations should go literally and absolutely out of existence that are named here in article 15, do you not know that it is the universally accepted legal proposition that a trust never falls for the want of a trustee?

Mr. SILVER. Yes. I am not a lawyer, but—

Mr. WRIGHT. But you recognize that principle of law?

Mr. SILVER. Yes.

Mr. WRIGHT. As a sound legal proposition?

Mr. SILVER. Yes.

Mr. WRIGHT. Then would not a court of chancery, in the event all these organizations should go out of existence and have no successors, appoint representatives

from some organization nearest like the ones which did go out of existence; would not that be the rule in a chancery court?

Mr. SILVER. That might be the procedure.

Mr. WRIGHT. That is a well-recognized principle of law, if you are not familiar with it.

Mr. SILVER. Yes; I believe that is a well-recognized principle of law.

Mr. WRIGHT. It proceeds on the idea that the court will lay hands on it and appoint trustees to act in the place of those who may have gone out of existence, so that the trust will not fail.

Mr. SILVER. Yes; but as it occurs to my mind, I attach but little importance to the suggestion that there will be no farm organizations, even though the existing ones might pass away.

Mr. WRIGHT. I agree with you about that.

Mr. SILVER. The grange is 50 years old, and better to-day than it ever was. Fifty years or 100 years is not a long period for a farm organization, and just so long as we have agriculture, with the national life we have and with all the other groups organized of necessity and for self-protection, the farmers will have to be organized. So I think there is a very remote possibility of that happening.

Mr. WRIGHT. In other words, if the activities mentioned in section 15 really function, you do not anticipate there will not be some one to take the places of the organizations here named.

Mr. SILVER. There will be somebody to take their places.

Mr. WRIGHT. That would inevitably follow, would it not?

Mr. SILVER. Certainly; there is no doubt about it.

Mr. WRIGHT. And you say you do not think there is any chance of our not having farm organizations as long as we continue to farm.

Mr. SILVER. I just firmly believe that.

Mr. WRIGHT. But the interests you represent would have no objection to clarifying that language or making it stronger if words could do that?

Mr. SILVER. I do not know that we have any objection. We are satisfied with that language and we are not asking anything in addition.

Mr. WRIGHT. But any other words that will better effectuate the intention you all have in mind, you would not object to?

Mr. SILVER. I think not.

Mr. WRIGHT. In other words, if some more permanent organization could be suggested, making it nearer in perpetuity, there would be no objection to that?

Mr. SILVER. Of course, I would hate to pass on it without knowing what the form of the suggestion was, but as a general proposition, I would say no.

Mr. CROWTHER. I would like to ask just one question. You said you were a farmer, Mr. Silver?

Mr. SILVER. I am.

Mr. CROWTHER. Are you an active farmer now?

Mr. SILVER. I am.

Mr. CROWTHER. Are you all the time in Washington?

Mr. SILVER. I am here the greater part of the time.

Mr. CROWTHER. Somebody else runs your farm, then?

Mr. SILVER. Yes.

Mr. CROWTHER. Are you a salaried representative?

Mr. SILVER. I am.

Mr. CROWTHER. Would it be an impertinent question to ask what your salary is?

Mr. SILVER. No, sir; I have no objection on earth to stating that. I am paid \$10,000 a year.

Mr. CROWTHER. Of course, I know it is easy to get mixed up on questions where you are interrogated so often, but you just stated to Mr. Quin in answer to his interrogatories that you considered that contract all that was necessary and perfectly satisfactory.

Mr. SILVER. With the reservations, of course, which I have spoken of several times to the committee.

Mr. CROWTHER. Oh, yes; but in answer to him you stated it was perfectly satisfactory, and a just recall the fact that you had on several occasions stated there was new language that your organization was considering that you thought was necessary and which might be added to the contract, to the advantage of everybody?

Mr. SILVER. I was always keeping that in mind.

Mr. GARRETT. As I understand it, the farming interests which you represent believe you have language there which will amply protect the farming interests in the years to come?

Mr. SILVER. Yes.

Mr. GARRETT. That is what your people believe about it?

Mr. SILVER. Yes.

Mr. GARRETT. But if the analytical minds of this committee should think that perhaps you needed stronger language to protect your interests, you have no objection to that language being used and you would welcome any suggestions looking to that end?

Mr. SILVER. I have always approached the committees of Congress in that way. I have given them our thoughts and beliefs and have been mostly happy with their actions.

Mr. MORIN. Mr. Silver, if the Government should receive a proposal from any other concern which in the judgment of this committee or the Members of the Congress would be more advantageous to the Government than Mr. Ford's proposition, would your organization advise that they accept it?

Mr. SILVER. Would you state that again? I do not know that I quite caught it.

Mr. MORIN. If the Government should receive a proposal which, in the judgment of this committee or the Members of the Congress, would be more advantageous to the Government than Mr. Ford's proposition, would your organization recommend that they accept it?

Mr. SILVER. I would scarcely be in position to pass on that without our executive committee and our people passing on it. I would not want to take a position contrary to that which they have taken. There is no proposal before us, except what we have spoken about, and, if some other condition arose, I would want to meet it at that time. It would hardly be right to ask me to speak to an imaginary situation that might arise.

Mr. MORIN. What would be your personal opinion? Do you not believe we should accept the very best proposition we receive from any source?

Mr. SILVER. We want the best that can be had out of this situation, and, as it stands now and has stood for months, we believe Mr. Ford's proposition is the best one.

The CHAIRMAN. If there are no further questions, we are very much obliged to you, Mr. Silver.

Mr. SILVER. I thank you very much. Mr. Bower is here and will go into some phases of the fertilizer end and the technical end of this matter, which, personally, I am not qualified to do.

STATEMENT OF MR. R. F. BOWER.

The CHAIRMAN. Mr. Bower, will you please state your name and also the business you are in?

Mr. BOWER. R. F. Bower. I am Mr. Silver's assistant in the Washington office of the American Farm Bureau Federation.

The CHAIRMAN. Will you proceed in your own way, please, to state just exactly what you want the committee to know regarding the attitude of your organization regarding Henry Ford's offer?

Mr. BOWER. Thank you, Mr. Chairman. I will try to address myself to clearing up the matter along the lines of the letter which Mr. Silver submitted to the committee in the early part of the hearing, inasmuch as we thought there might be doubt created in the minds of the committee as to the reasons why we advocate Mr. Ford's proposal, and I will try to present this matter as it appears to us who have studied this nitrogen-fixation question for some time.

I think it might be of interest to the committee if I would present to you at this time a resolution adopted by the national and State officials of the Farmers' Educational and Cooperative Union of America and of the National Grange, adopted unanimously on February 8, 1916. This resolution appears in the records of the hearings of this committee in considering the national defense act of 1916. I would like to read just two paragraphs of it.

"It is hereby resolved," etc.

"(1) That we hereby, as strongly as possible, appeal to the President and Congress of the United States that during the present term of the Sixty-fourth Congress, such legislation shall be enacted as will authorize the construction of a dam or dams for the development of the necessary power for the fixation of the nitrogen of the atmosphere as a fertilizer, and in such quantities to supply the needs of the Government and as far as possible supply the demands

of agriculture and by this development free, in part, the farmers of this country from the Chile saltpeter monopoly.

"(3) We insist that the location of this air nitrate industry be determined with reference to the agricultural interests of this country and that a site be selected that has near it a source of limestone, coke, and phosphate rock, as has been recommended by the Department of Agriculture, and that furthermore, if possible, it be selected closest to the greatest consumption of fertilizer in this country."

Mr. Chairman, the Government has embarked upon this program which we sought in 1916. It has partially developed a water power for this purpose. It has built the fixation plant for its own purpose, brought out by the war. It is located close to sources of limestone, coke, and phosphate rock, and it is located closest to the greatest consumption of fertilizer in this country.

We ask that this be completed and finished for the purpose, as outlined in section 124 of the national defense act; and in that act, as you gentlemen of the committee know, who were present when that was considered, fertilizer was one of the strong considerations you had in mind, although, of course, we realize that your nitrogen for national defense was primarily in all your thoughts in connection therewith. Section 124 mentions fertilizer as one of the reasons for the passage of that section. I am sure the committee will agree that the intention was that fertilizers were to be produced in times of peace if it could be so done economically and properly.

Now, this plant has a potential value for agriculture, and the only way you can prevent that value from becoming available is to allow it to remain idle, and you can not take the potential value away from it even then, because if operated, it does have a value. Fortunately, both your purposes and ours are best served by the operation of that plant. While it has been denied—and I will refer to that later—that the operation of the plant is the best way to keep it, we can not agree to that for a moment, and an operating plant kept abreast by research and development by Mr. Ford, as he proposes to do at his own expense, is certainly a more efficient protection to the Government than an idle plant, depreciating, and requiring to have repairs made. Fortunately, the operation of this plant is the identical thing that serves the purpose we seek.

Daniel Webster has said, "Farmers are the foundation of civilization and prosperity. The farmer must always be the foundation, but that does not mean that he must be kept beneath the surface." We ask you, in consideration of your decision on this proposition, that we be not kept beneath the surface. In making this decision between the propositions you have before you, you have that choice to make, and the proposition made by Mr. Ford does not propose to keep the farmer beneath the surface. The proposition, as I have read it, in the official copy transmitted by the Secretary of War, of the Alabama Power Co., makes no provision for the farmer.

This whole question is a question of soil fertility. Our national permanence depends upon soil fertility. Mr. Silver stated that but for the maintenance of our soil fertility this land would become a desert, and I think we only have to look back into history to see that among the great nations of the past, they passed away on account of the destruction of their soil fertility. Assyria and Babylon and the great nations of biblical times, supporting millions of people, raising great armies in Persia that came across into parts of Europe, are to-day desert wastes where crops will not grow, and they were destroyed fundamentally, because of the destruction of their soil fertility. So we are addressing ourselves to a problem that is of interest to everyone, not necessarily only from our viewpoint, but from the viewpoint of the future of our Nation, which depends upon the maintenance and continuance of our soil fertility.

It is the duty and the business of a farmer to raise as large crops from his soil as it is possible for him to do; that is his business. But he has a sacred obligation to all society and to his nation to maintain the fertility of his soil so that future generations can be fed. If he neglects that we will not continue as the prosperous, independent Nation we are to-day.

This requirement is absolutely fundamental, and it has been well stated by Theodore Roosevelt in the Outlook of October 12, 1912, at page 295, where he said:

"I have always been deeply impressed with Liebig's statement that it was the decrease of soil fertility, and not either peace or war, which was fundamental in bringing about the decadence of nations. While unquestionably nation-

have been destroyed by other causes, I have become convinced that it was the destruction of the soil itself which was perhaps the most fatal of all causes."

How can we maintain soil fertility? There has been a great deal of talk about soil fertility and a great deal of talk about fertilizers, but it is a simple proposition. Soil fertility can only be maintained by replacing into the soil those elements that the crop takes out in its growth. That is the only way you can do it.

And the best way to do that is through the use of high-grade commercial fertilizers at low prices. The use of commercial fertilizers at a reasonable cost serves a double purpose. Not only does that maintain the fertility of the soil but it provides the farmer with the most efficient labor-saving devices he can use; that is, the labor of one man on a field with efficient fertilizer application will raise the amount of crops that two men could raise without that fertilizer, and the whole question is one of getting the fertilizer at a proper price. The use of cheap fertilizer compounds consequently will enable the farmer to compete for the high wages paid by the industries in the cities, and there is no other way for him to reach that attainment so much desired.

Another point with reference to this soil fertility is this: It has been suggested that we have gone ahead and continued to feed the Nation with what you have, and that we are raising a bugaboo. But in the past increased food production demanded by the Nation has been met by a westward progression of agriculture on to the great virgin plains of the Mississippi Basin. We have finished that exodus of eastern agricultural population to the West, and to-day there is practically no great area of fertile virgin land still to be brought under cultivation. Of course, there are irrigation projects and drainage projects, but there is no great acreage section of the country where the farmers can go without great expense to the Government to bring that land under cultivation and produce the additional crops that our increasing population will demand.

The determining factor of fertilizer seems to have been lost sight of largely in this respect, and that is that it is a matter of price. It is the cost of fertilizer that is the deciding factor all down the line. It is the price of the material that makes the chemical into a fertilizer. You may take the nitrogen compounds or the phosphorous compounds that a druggist will retail to you over the counter and put them on the soil. They will increase the crop production, but they are not fertilizers. But when they reach a point in price that a farmer can buy them and apply them to the soil and increase crop production so that the increase will more than pay for the application of this fertilizer to the soil, you have a fertilizer. And the price of the fertilizer is what limits its consumption in this country. With all the figures presented to you, showing that there is a 7½ per cent increase in fertilizer consumption, as Mr. MacDowell said, this thought has been entirely overlooked. I would not venture to tell the committee what the consumption of fertilizers would be if the price was reduced one-third. The cost price of fertilizer right now allows its application only to the high value crops. That is why you have the great use of fertilizers in the South and eastern parts of the Nation; and more than the fact that the soil has become exhausted is the fact that the high-value crops which the eastern farmer raises will allow the application of fertilizer, where the low-value crops, from which the main food supply comes, such as wheat and corn, do not allow the application of fertilizer at present prices.

Fertilizer must pay its cost, plus a profit to the farmer; if it does not do that it is of no value to him. Fertilizer is just three elements combined in the various combinations in which it is shipped to the farmer—nitrogen, phosphorus, and potassium. You hear nitrogen mentioned as ammonia, ammonium sulphate, ammonium nitrate, sodium nitrate from Chile, cottonseed meal; those are all carriers of nitrogen fertilizer. Phosphorous fertilizer is carried almost solely by what they call acid phosphate. It is the phosphate rock treated with sulphuric acid that carries our phosphorus. Unfortunately, our potash has to come principally from Germany, because of the price. Nitrogen is the limiting factor in crop production in most of our worn-out soils.

I might use an illustration of a barrel in which the staves are broken; one stave is broken about one-third way up toward the top of the barrel, another stave is broken about half way up the barrel, and another stave is broken two-thirds of the way up the barrel. The crop is demanding three elements—nitrogen, phosphorus, and potassium. The nitrogen in most of our soil is the stave broken off just one-third the way up the barrel, and when the crop has reached the point where it needs more nitrogen, which is not there, it will not go up, no matter how high the staves are that carry the phosphorus and potash, but

it runs out at that point. But if we have a sufficient amount of nitrogen the crop will go up until it reaches the phosphorous leak, and then the crop production stops at that point. But if we have enough of those two elements but do not have a sufficient amount of potash, the crop will go up to the third broken stage. If we have a sufficient amount of all of those elements it will run over the top.

Let me give you an illustration to show why nitrogen is the limiting factor. A 100-bushel crop of corn in the grain and stalk takes from the soil 148 pounds of nitrogen, 23 pounds of phosphorus, and 71 pounds of potash. You can easily see the large proportion of nitrogen, 148 pounds to 23 pounds of phosphorus and 71 pounds of potash.

In order to show you what the demand for nitrogen is—and you have had it stated here that our demand will not use the output of the sulphate oven—in 1909, corn, wheat, and oats in grain alone removed from the soil of the United States 3,965,000,000 pounds of nitrogen, 606,000,000 pounds of phosphorus, and 875,000,000 pounds of potash. That was in just three crops in the grain alone. Of course, some of the stalk did not come back on the land, and I am assuming that the farmer kept his straw and grain fodder and spread that over the fields. But the grain is shipped, and that amount was taken out of the soil by just those three crops. To replace this nitrogen into the soil would require 9,912,500 tons of ammonium sulphate a year. And yet we are told that 500,000 tons a year is all the farmers can use. It is all they can use at the price they have to pay, and if we are going to replace this nitrogen into our soils we have to get cheaper nitrogen.

I think the committee would be interested in the testimony given before the Committee on Agriculture by Mr. Washburn on February 9, 1916, on page 4 of the printed hearings, where he said:

"I believe, therefore, that the best way in which I can contribute something of possible value to your deliberations is to confine myself in the main to what is possibly the most important single difficulty the farmers of this country face in the matter of fertilizing their crops, and the most effective single remedy therefor. I refer to the always high and frequently prohibitive cost of the nitrogen fertilizer as the difficulty, and to Government cooperation in the establishment of the nitrogen industry within the borders of the United States as the remedy." That statement was made by Mr. Frank S. Washburn, the president of the American Cyanamid Co.

The CHAIRMAN. At that time was he president of the Alabama Power Co.?

Mr. BOWER. I think at that time he either was or had recently been vice president of the Alabama Power Co. On page 6 there is a statement which I think I will read to you from the testimony of Mr. Washburn at this same hearing, because at that time he clearly sets forth the problem now before Congress. He said:

"It is probably true that a limited amount of nitrogen applied to the soil is profitable substantially regardless of its cost. The effect of additional nitrogen upon increased crop production is known and measureable as a result of continuous experimentation covering a period in England, for instance, of 60 years. These experiments have been directed and supervised by the greatest scientists in every civilized country, and in consequence we know that normally a pound of nitrogen will increase the wheat crop by one-third of a bushel of grain and 40 pounds of straw, the corn crop by five-eighths of a bushel, the potato crop by 1½ bushels, the tobacco crop by 10 pounds, the cotton crop by 5 pounds, and so, indefinitely. The American farmer pays, on the average, 25 to 30 cents per pound of nitrogen constituent, and, therefore, when we take wheat at 86 cents per bushel and no sale for the straw, he practically breaks even on his investment in nitrogen. His entire profits, therefore, must lie in the sale of the extra quantity of straw.

"On corn at 57 cents per bushel he has a net profit of 25 per cent of the cost of the fertilizer; on potatoes at 60 cents per bushel a net profit of 240 per cent; on tobacco at 10½ cents per pound, a net profit of 275 per cent; and on cotton at 12 cents per pound a net profit of 115 per cent. These prices assumed are the five-year average received by the farmer, 1909 to 1913, inclusive. To obtain the true net profit one must deduct the cost of handling the fertilizer from the railway station and applying it to the soil. I want to draw special attention to the significance of the figures which have just been given in as far as they apply to the cereal crops. Here the profit in the use of fertilizers at prevailing high prices is comparatively small and uncertain. These crops cover 60 per cent of the cultivated acreage in the United States, and in these

figures we have in part the explanation of why it is that the use of nitrogen is practically confined in the United States to crops other than the cereals, such as cotton, potatoes, truck, tobacco, etc."

I think that clearly demonstrates why these fertilizers are used extensively on cotton, tobacco, and potatoes. Now, in this matter the question is where are we going to get this nitrogen. I think I have demonstrated the fact that we need it, and there is only one source from which we can get it, and that is from the air. The Chilean nitrate beds are eventually going to be exhausted; in a hundred years, according to the testimony of some experts, they will be exhausted. The cheapest deposits have been exhausted. They can not lower their price suddenly unless they cut out their export duty, which we hope the operation of this plant will make them do.

In the same year, 1916—and there has been considerable development in the art since that time—the American Cyanamid Co. again, through their president, Mr. Frank S. Washburn, on page 5 of a hearing before the Senate Committee on Agriculture and Forestry, on March 16, 1916, testified as follows:

"What has been obtained, economically speaking, is this: That the factory costs under most favorable conditions, those which are not only theoretically obtainable, but actually obtainable in some parts of the world, everything, including overhead and superintendence, and all that sort of thing inside the factory, but not including the interest on the investment, for producing nitrogen comparable to the nitrogen that is in the Chilean nitrate is about one-third of the ordinary market price of the Chilean nitrate.

"Senator SMITH of South Carolina. You mean to say that the factory cost is about one-third of the selling cost?

"Mr. WASHBURN. Of the selling cost of Chilean nitrate."

Also, in a hearing before the Committee on Agriculture of the House on February 9, 1916, Mr. Washburn said:

"My anticipation is that the establishment of the nitrogen industry, as it can be established with what I believe, and what I believe would appeal to those who study the subject, is the proper and legitimate Government cooperation, will give the farmer his fertilizer for one-half of what he would otherwise pay for it."

In testifying before the Senate Committee on Agriculture and Forestry Dr. L. H. Baekeland, one of the foremost chemists in this country, an independent chemist and the inventor of Baekolite, a man well recognized in the profession, made the following statement on this subject of the fixation of atmospheric nitrogen:

"The statement is made by the present Government monopoly in Germany that after the war is over and after what they know now about the synthetic manufacture of nitrogenous fertilizer from the air, after all the experience they have acquired during this war while making nitric acid, that they will be in such condition that they intend to furnish the farmers of Germany nitrogen fertilizer at about one-half the price it is costing the consumer here in the United States. If Germany can do that, gentlemen, there is not the slightest doubt in my mind that we can do the same here, or that we can do better."

The report of the nitrogen products committee of the British Empire, in item (d), paragraph 654, on page 133, says:

"Combined nitrogen, as cyanamide or ammonium sulphate, can be obtained by synthetic processes at a cost, at the factory, which is less than one-half the market price of combined nitrogen from other sources, prewar conditions being taken as a basis in each case."

As an interesting matter in this connection, I have a copy of an argument prepared by the Koppers Co., of Pittsburgh, arguing for a duty on sulphate of ammonia, and on page 8 of that argument, under the heading, "Why protection by legislation is necessary," the second paragraph says:

"The cost of operating these plants is relatively low, so that even to-day sulphate of ammonia is being sold in Germany at half the price in the United States, based on the present rate of exchange."

So it is an accomplished fact in Germany.

Now, Dr. Whitney and Dr. Tolman and Mr. Swann have given some wonderful testimony to this committee as to the possibilities of the phosphorous compounds by the use of the electric furnace, all depending upon cheap water power, which we believe we can secure through the operation of this plant under the contract proposed by Mr. Ford. I will not read their testimony in regard to these high-grade materials, except to show you a few things along that line. I will come back to that a little later.

The development of the fertilizer industry will not bring about the necessary improvement in the use of high-grade fertilizer compounds through a slow improvement; that is to say, 16 per cent is the highest content phosphate material furnished to the American farmer to-day.

The CHAIRMAN. You say 16 per cent?

Mr. BOWER. Sixteen per cent acid phosphate. It is not possible to make economically 20 per cent acid phosphate; there is no way of doing it, and the next compound jumps, as testified by Dr. Whitney and Mr. Swann, to the several superphosphates, which carry above 40 per cent, and if we are going to make this step now, we have got to cross that creek. We can not make two jumps, land at 20 per cent and go on to 40 per cent. We have got to jump from 16 to 40. The present fertilizer industry, with its investment in acid-sulphate plants that are making 16 per cent, feel probably that the jump could not be made. It would injure them—I do not question that for a moment—and I think that explains the reason why they are here. But agriculture must go on; we must feed our crops; we must begin to do it intelligently and scientifically. And Mr. Washburn himself recognized that situation in his testimony before the Agricultural Committee of the House in the same hearing I referred to a moment ago, when he said, "The answer to the fertilizer problem, to be of any practical and immediate value, must lie in revolutionizing present conditions instead of slow evolution proceeding under their domination." He recognized that it must be a jump to get to these high-grade materials; and this is the crux of the whole situation and the cause of the opposition. There is no question about it. It is not that these gentlemen are coming here in a philanthropic spirit to prevent the Government making a bad deal with Mr. Ford.

Last year—if I may be permitted to inject this at this point—when the proposition was for the Government to operate this plant and try to secure the same results there was no bad bargain with a private individual interwoven in it or connected with it, and they were just as strenuous in their opposition, as most of you gentlemen know. What they fear is the result of this development. What we seek as farmers is to maintain our soil fertility and increase our crop production through the greatly increased use of fertilizer material. It is those results that these gentlemen fear. It is a clear-cut issue. You can not take a step forward in the line of progress without treading on somebody's toes, and unfortunately to make this development somebody's toes have got to be stepped on. But I am sure that the committee would not agree that the interests of an industry dependant upon a primary interest such as agriculture should be considered as superior to the interests of agriculture itself. That is not a situation that will appeal to the people of this country as a whole, and certainly it will not appeal to the farmers.

Now, with reference to the nitrogen production in this country. I want to make this flat statement, and that is, simply that there is no business in the United States of America engaged primarily in the production of nitrogen compounds. All nitrogen compounds produced within the borders of the United States are by-products of industries that depend upon the sale of a major product for their existence; and these industries who are asking that you protect their interests are asking you to protect the interests of a by-product of another major industry. Take, for instance, if you please, the by-product coke ovens. Their major product is coke, for the steel industry, and by the testimony of Mr. MacDowell the cost of the ammonia in a ton of ammonium sulphate, the 500 pounds in a ton of ammonium sulphate is \$1.50. That is his statement. They argue if they do not get a dollar and a half for the 500 pounds of ammonia they will have to increase the price of coke, and consequently increase the price of steel; but the amount of ammonia they get in producing a ton of coke is not worth 15 cents on the ton. It is only worth about 6 or 7 cents. I will put the correct figures on that in the record. If I am not mistaken it is not more than that on a ton of coke. On the basis of \$1.50 per 500 pounds of ammonia it is 0.021 cent per ton of coke.

The CHAIRMAN. How much is it on a ton of steel?

Mr. BOWER. I will try to obtain those figures. I do not know exactly the amount of coke that is used in the manufacture of a ton of steel, but I can get that information for you.

The CHAIRMAN. I wish you would put that in the record.

NOTE.—One ton of coke is used to 1 ton of steel. So it would be the same 0.021 cent on a ton of steel.

Mr. BOWER. I will be glad to do it. In the case of the by-product coke-oven industry they have said repeatedly, and they used that argument most effectively.

last spring, that their production was 550,000 tons of ammonium sulphate per annum; but if you read the testimony carefully where they make that statement—and I notice Mr. MacDowell was careful to make it in that way—you will see that it refers to sulphate equivalent. The meaning is simply this, that 550,000 tons per annum is the amount of ammonium sulphate that they can produce if all the ammonia recovered from the by-product ovens was manufactured into ammonium sulphate and sold as such; but that is not the situation. Their primary market which is always supplied first—I do not mean in point of time, but first in point of the industry—is the great market for aqua ammonia and anhydrous ammonia and the various ammonia liquors that go into household use, and that amount has got to be deducted from the amount of ammonium sulphate produced before the farmer gets any ammonium sulphate from the by-product industries. In 1920, which is the biggest actual production year the by-product coke-ovens ever had, the total production was 467,000 tons. That is the production of sulphate equivalent; that was their total production, 467,000 tons. The actual production of ammonium sulphate, which is the fertilizer ingredient, was only 337,500 tons, and that was the largest year the by-product coke ovens ever had. So you will see that there is a difference there of 129,500 tons of sulphate equivalent going into ammonia liquor. Let me just point out another difficulty. Those figures are from the United States Geological Survey statement as to the by-products obtained from coke-oven operation in 1920.

There is another difficulty in depending upon such a by-product source for our nitrogen. During this past year, as you gentlemen know, the farmers of this country have been passing through one of the worst crises that agriculture ever experienced in the United States. Yet the by-product coke ovens are nearly shut down; the steel industry has come to a halt, and the production of ammonium sulphate is not coming forward; and exactly identical conditions will again take place whenever you have a crisis in agriculture. When agriculture goes through a stress and storm period, as has been the case recently all over the country, all industry slacks down, eventually working back to the steel industries; and when the farmer needs a larger amount of cheap fertilizer to get back on his feet the production of ammonium sulphate is reaching its lowest level in the course of its decline following after agriculture. That is one reason why the American farmer can not get cheap nitrogen to increase his soil fertility. This is a by-product, with a preferential first market for the ammonia liquors before we get any. In 1920 the exports amounted to 59,568 tons.

Last spring, when the proposition was for the Government completion and operation of this project, the by-product coke oven interests were actively engaged in defeating it, and following its defeat they prepared a document arguing against the completion of the Wilson Dam for the operation of nitrate plant No. 2. They sent out a letter to a large number of by-product coke-oven manufacturers over the country in effect stating that while the proposition had been defeated last spring it would undoubtedly come up again in the fall and they wanted to be prepared, and they got quite a few signers on the back, about 20 of them. I want to call attention to five of those especially, namely, the Indiana Coke & Gas Co., of Terre Haute, Ind.; the Minnesota By-product Coke Co., of St. Paul, Minn.; the New England Fuel & Transportation Co., Boston, Mass.; the Seaboard By-product Coke Co., of Jersey City, N. J.; and the Koppers Co., of Pittsburgh, Pa. Those five I wish you to remember for a moment.

Mr. CROWTHER. Why not put the names of the other signers in the record?

Mr. BOWER. I would be very glad to have them all printed in the record. I have a reason for calling especial attention to the group I have mentioned, and I have no objection to all the names going in the record. The other signers were: Alabama By-products Corporation, Birmingham, Ala.; Camden Coke Co., Newark, N. J.; Citizens Gas Co., Indianapolis, Ind.; Coal Products Manufacturing Co., Aurora, Ill.; Chattanooga Coke & Gas Co., Chattanooga, Tenn.; Donner Union Coke Corporation, Buffalo, N. Y.; Domestic Coke Corporation, Fairmont, W. Va.; Gulf States Steel Co., Birmingham, Ala.; Inland Steel Co., Buffalo, N. Y.; La Velle Iron Works, Wheeling, W. Va.; St. Louis Coke & Chemical Co., Chicago, Ill.; the Hanna Furnace Co., Cleveland, Ohio; the Milwaukee Coke & Gas Co., Milwaukee, Wis.; Toledo Furnace Co., Toledo, Ohio; the Brier Hill Steel Co., Youngstown, Ohio; the Youngstown Sheet & Tube Co., Youngstown, Ohio; Woodward Iron Co., Woodward, Ala.; Zenith Furnace Co., Duluth, Minn.

Following the defeat of the Muscle Shoals appropriation, when the tariff bill passed the House, after it had passed the attention of the farmers was called to the fact that there was a duty of \$12 a ton on ammonium sulphate

in the tariff bill, on the very product that they manufacture; and after they had argued that their production was ample for the American farmer and at as low a price as he could get it from anywhere, they turned right around and asked for this duty, and it was put into the tariff bill. There was no public hearing, or at least no printed hearing, and I have examined them very carefully to see what representations were made. But the duty of \$12 a ton is in the tariff bill as it passed the House for the first time.

When we took up the matter we found they had been to the Senate Committee on Finance and had presented testimony there asking that the duty of \$12 a ton be left in the tariff bill. They gave their reasons in the hearing before the Senate Finance Committee on Schedule 1. The hearing was held on July 30, 1921, before the Senate Committee on Finance, and in their statement they say: "What we do fear is abrupt and demoralizing fall of prices due to the flooding of our markets with unnaturally cheap material manufactured in German-subsidized, syndicate-controlled, war-built munitions plants, and that the American product will be displaced on the American market by unnaturally cheap material made by low-priced labor in these plants built during the war to manufacture munitions." That is the danger they feared, and what they sought protection against was not the Chilean nitrate, but the German fixed nitrogen, and they got their duty. The reason I called your attention to the names of those signers of this statement is that in the list of organizations represented by this committee are the very five names that I read to the committee as signing this argument in opposition to the completion of the Muscle Shoals nitrate plant. That is, after defeating what the farmers believe was a chance to get cheaper nitrogen, and having, as they claimed, defeated that, and according to their letter preparing to carry their opposition through to this Congress, they turned around and got \$12 a ton duty in the tariff bill protecting them in their high-priced nitrogen.

Mr. CROWTHER. May I interrupt long enough to say that I hope we might have a copy of the letter in which they claim to have defeated that measure. It seems to me we ought to put that letter in the record.

Mr. BOWER. I will try to procure a copy of that. I had one, but it has been misplaced. I will state this, that they did not state definitely in the letter that they had defeated this proposition, but the set-up was that this has been defeated, but is coming up again this fall, and we must be again prepared to protest against it. That is the whole tenor of the letter. I do not think they made the flat statement that they had defeated it.

Mr. CROWTHER. I think with that statement the letter need not be put in the record.

The CHAIRMAN. I think it would be a good thing if you could get the letter and put it in the hearing.

Mr. BOWER. I will try to get it. Understand me, Mr. Chairman and gentlemen, I am not criticizing the House of Representatives because of that duty of \$12 a ton in the tariff bill, because I do not believe any member of the committee or the House knew that that duty was in there when the tariff bill passed.

The CHAIRMAN. This committee has nothing to do with the tariff bill.

Mr. BOWER. I understand that, but this bill has already passed the House. I do not want you to think that I think the members of this committee really knew that that duty on ammonium sulphate was in there, because if they had known it I am sure they would have taken it out.

Mr. CROWTHER. We could not take it out; the bill was passed under a rule and there was no way to amend it, or take anything out of it.

Mr. BOWER. The thought in our minds is that the arguments which have been presented to you have been that we should be left to depend upon such sources of industry that would do away with all our efforts to get cheap nitrogen and all we want of it. We would never get it.

The next great source of nitrogen produced in America is cottonseed meal, and there we are making an economic mistake in putting back in the soil cottonseed meal.

Cottonseed meal should go to the dairies of Mr. Crowther's State and of Iowa to feed the cattle or to feed their stock. It is much more valuable for that than to feed the soil. Then there is also the tankage and the blood meal and other by-products of the packers' industry which are going into hog feed, and they should not go into soil to be used in the production of crops. All of the producers of by-products contend that their interests in this by-product should be

protected as against the interests of agriculture trying to feed and clothe the country and maintain soil fertility.

It is interesting to note in that connection, in dealing with cottonseed meal, that the Southern Cotton Oil Co., the largest cottonseed meal producer in the South, is owned outright by the Virginia-Carolina Chemical Co., which company James B. Duke controls. He also owns 24 per cent of the American Cyanamid Co., and the Virginia-Carolina Co. also owns 26 per cent of the American Cyanamid Co. I notice in the testimony it was stated that the amount of stock that Mr. Duke owns in the American Cyanamid Co. is 23 or 24 per cent. That amount was indefinite, but the ownership in the American Cyanamid Co. of the Virginia-Carolina Co. was definitely fixed at 26 per cent. We think it would add up to about 51 per cent if the figures were exact.

With that thought in mind, we turn to the statement of the American Cyanamid Co., whose representative at this hearing has denounced this proposition of Mr. Ford as a subsidy. When questioned as to what that subsidy consisted of, it was in the securing of water power at 4 per cent interest, and he further stated that his company would not have the nerve to make such a proposition. I would like to read what is said on page 11 of the hearings held before this very committee, the Committee on Military Affairs of the House, in 1916. This was a hearing by this committee held on February 11, 1916. Mr. McKenzie asked this question:

"As I understand your plan, Mr. Washburn, it is this: You recommend the cooperative plan, rather than the independent or Government-owned plant?"

Then the following occurred:

"Mr. WASHBURN. The only plan that seems feasible to me.

"Mr. McKENZIE. Let me see if I understand you. Your plan of cooperative work is to take the power site, where the Government has constructed a dam for purposes of navigation, or to aid navigation, and the company that would manufacture this product would then build its structures alongside of this power site, and the Government would permit them to use the power; and they would pay, as I understand you, 3 per cent on account of the construction of the dam. In other words, the Government would build the dam and the company would erect a structure for the manufacture of the product, cooperating with the manufacturing concern, and it would manufacture this product for fertilizer during time of peace, and the Government would have the right to take the entire product during time of war, and that the company should pay annually to the Government 3 per cent on the investment in the dam; is that correct?

"Mr. WASHBURN. Upon the investment in the dam and such hydroelectric equipment as was necessary to put the power on the switchboard.

"The Government investment devoted to power normally would include the dam, and the power house and its equipment and the power would be paid for by the nitrogen industry at 3 per cent of the cost. That would be an annual tax upon the nitrogen industry."

In fact, this company which denounces the Ford proposition as a subsidy at 4 per cent interest was here before this committee in 1916 asking for the identical thing at 3 per cent interest, and they called it "proper Government cooperation." With such testimony as that they come before you and ask that this contract they have made, which they say is a moral obligation, shall be lived up to. I think they have violated all of the morality that is in the contract, and the Acting Judge Advocate General of the War Department says there is not any legal point involved.

Their representative stated that if you did this thing in time of war you would have to deprive the agricultural interests of a product of this plant. His solution was to deprive us in time of peace, so as not to deprive us in time of war. With such an argument as that, he did not respect the intelligence of the committee. He said that they could not make cheap fertilizer in this plant. I would like to refer again to page 14 of the hearing before the Agricultural Committee of the House held on February 9, 1916, where Mr. Washburn stated:

"My anticipation is that the establishment of the nitrogen industry, as it can be established with what I believe, and what I believe would appeal to those who study the subject, is the proper and legitimate Government cooperation, will give the farmer his fertilizer at one-half of what he would otherwise pay for it."

We submit that if the Government will complete this water power and allow Mr. Ford to have it, we will get fertilizer at one-half of what we would otherwise pay for it.

The representative of the American Cyanamid Co. stated again that an idle plant is better preparedness than an operating plant. I do not know whether

the committee wants me to continue this parallel right on or not. I do not know exactly what to call it. But in a hearing before this very committee on that question, Mr. Washburn, on page 10 of the hearings on February 11, 1916, made the following statement:

"The staff that would steadily be employed in this plant would be 2 per cent to 12 per cent of the number that would be required in the event of war for its full operation. Chemical plants of this kind require a trained body of men; and in event of war threatening the country, we should have almost insuperable difficulty of training from green hands substantially 90 per cent of the requisite directing and working force. It is fairly a matter of grave doubt whether under the unsettled conditions and excitement of approaching war and the exigent demands upon every one connected with the Army and Navy, such a plant could be placed in full stride in less than a year. It may be conceivable that a plant of this sort could be maintained in idleness without such a degree of deterioration as to render it useless, but it is highly improbable that it would be so maintained, and a country which should rely for its powder supply upon the practically indefinite maintenance in working of an idle plant composed of highly delicate and complicated appliances would take a most extraordinary risk, which, if it can be avoided, would be wholly unwarranted. A minor objection would be the cost of maintaining such a plant in readiness for operation, its upkeep, the interest on the idle capital."

So in 1916 it was an operating plant that would protect the Government against the inefficiency, and now it is an idle plant, and they propose an idle plant.

Furthermore, this plant is a Canadian plant, built in Canada, and manufacturing its product in Canada, and paying taxes in Canada upon the plant.

Now, we come to the other great interest we believe will be affected by this development. That is Chile and the sodium nitrate industry of that country. Since 1880 there has been an export duty of \$12.53 per ton—that is, per long ton—or \$11.88 per short ton, on each ton of nitrate of soda exported from Chile. This has not been changed since that time, in spite of the claim of the by-product coke-oven industry that they are fully protecting the interests of the farmer. I submit that that is not true. There is no competition in supplying the American farmer with nitrogen when they will allow the foreign country to charge us an export tax of \$11.88 on every ton we use. In 1918, when we got into the last end of the war, because of contracts which could not be canceled that duty amounted to \$20,135,960.60. In 1913, a normal year, it amounted to \$7,381,874.08. Up to July 1, 1919—and I have not prepared the figure since that time—the duty we had paid to the Chilean Government amounted in total to \$163,647,680.68, for which the American taxpayer got nothing, and it did not contribute one iota to the value of the Chilean nitrate. Chilean nitrate is an absolute monopoly. There is a board called the Chilean nitrate board on which sit two representatives of the Chilean Government, and this board fixes the price and allocates the amount of Chilean nitrate which are sold to foreign countries.

In the testimony before Mr. Graham's committee questions were asked of Mr. Myers, who is the American representative of the Chilean nitrate industry, as to whether this group fixed prices, and he admitted it was so and then modified his statement saying he did not like the word fixed, that they stabilized the prices. But the prices are fixed just the same.

In the hearing before the Committee on Expenditures in the War Department, part 54, serial 6, page 3551, the following conversation develops this point:

"Mr. ALMON. Who fixes the price of Chilean nitrates?

"Mr. MYERS. The directorate of the association.

"Mr. ALMON. The Chilean association?

"Mr. MYERS. Yes, sir; in Chile.

"Mr. ALMON. It is in the form of a trust of all of the producers of Chilean nitrate, and one of its purposes and functions is to fix the price of Chilean nitrate, as I understand you?

"Mr. MYERS. Yes; but to stabilize the price is the word I prefer to use. 'Fix' sounds arbitrary and as though you were attempting to squeeze somebody. I do not think it fair and proper to use the word 'fix'; they are not extortioners or working in that sense at all."

I want to read once more a little bit from this report of the nitrogen products committee of the British Government, paragraph 413, on page 83.

The CHAIRMAN. What document is that?

Mr. BOWER. This is the final report of the nitrogen products committee to the ministry of munitions of the British Empire, who have made the most exhaustive study of the fixation of nitrogen that has ever been made, and the committee was made of the best men they had in the British Empire. They cooperated with Italy and France and sent the committee to Germany and studied the occupied territory there. This is their final report to the ministry of munitions of war of the British Empire.

The CHAIRMAN. What year was that?

Mr. BOWER. That was in 1920.

In paragraph 413, on page 83, it says:

"It is evident from the above figures that the supremacy of the Chilean nitrate industry is already being challenged, and the near future holds out the prospect that ammonium sulphate or synthetic nitrogen products may become the dominant factor in the nitrogen market and govern the price of nitrate instead of following it as hitherto."

I do not believe, as a summing up of our thoughts along that line, that I can do better than read the final summing up of this committee and their recommendations and their findings, because the farmer has to depend upon other people to do this work. We think this report is probably the most authentic report that has been made. Here are the final recommendations, preceded by a statement of salient facts. This is paragraph 654, on page 133:

"In making the recommendations set out below the committee has been guided by the following salient facts:

"(a) The sources of supply of combined nitrogen in the United Kingdom must be increased considerably if the existing and prospective home demands are to be met and the prewar scale of exportation is to be maintained.

"(b) The existing sources of supply of combined nitrogen in the United Kingdom proved wholly inadequate for meeting the war demands.

"(c) The risks and costs of importation during war are very serious.

"(d) Combined nitrogen (as cyanamide or ammonium sulphate) can be obtained by synthetic processes at a cost, at the factory, which is less than half the market price of combined nitrogen from other sources, prewar conditions being taken as the basis in each case.

"(e) Concentrated nitric acid can be made by synthetic processes for about half the prewar cost by the standard retort process via Chile nitrate.

"(f) The ammonia oxidation process provides a means whereby, during a state of war, the importations of Chile nitrate would be rendered unnecessary.

"(g) The world's demand for combined nitrogen appears to double every 10 years. The increased production during the war has not been more than the normal rate of increase during peace.

"(h) The actual consumption of combined nitrogen for agriculture in the United Kingdom has practically doubled during the war, and there is certain to be a further increase.

"(i) No very large increase in the output of by-product ammonia in Great Britain in the immediate future seems probable."

It is on those salient facts that they made the following recommendations with reference to the calcium cyanamide process:

"The committee recommends that this process should be established in Great Britain without delay, either by private enterprise (supported, if necessary, by the Government) or as a public work."

Now, with reference to the testimony of the National Fertilizer Association. They have sent out a great deal of propaganda in opposition to this proposition of Mr. Ford.

In spite of that propaganda in opposition to the Muscle Shoals development they have come forward with no proposition to accomplish the results we seek, which I believe the committee will agree are necessary for us to secure if we are to produce crops and maintain our soil fertility. They seem to be, as Mr. Greene expressed it in questioning Mr. Hammitt, playing the part of a dog in the manger. They do not come forward with any proposition to operate the plant and give us the results we want, and yet they say Mr. Ford shall not do it. I have here the propaganda sheets which they sent out. I do not think I will take the time of the committee to answer those. No. 1 sheet, which put the cost to the Government at something over a billion dollars, is answered by the bond issue which we advocate and ask for as a measure to establish this

plant and finish it so that there will be no additional expense to the Government required. Then, furthermore, gentlemen, you do not compound your interest on investments of that kind, because if you did you never could build a battleship, and you never could put a drop of water on an irrigation project, if you started to compound interest in any such way as this. That is the way Col. Cooper arrived at his figures, compounding interest on a sum of money which is not in existence—in other words, compounding interest on what he claims is a loss. You can compound interest on Mr. Ford's amortization proposition because he provides an actual fund with which the compounding of interest is to take place, but you can not do it on a minus quantity, if there is such a thing.

The CHAIRMAN. I have a letter from Mr. Cooper, just received before we began the hearing this afternoon, which he asks me to put into the record, showing that he has revised his figures somewhat.

Mr. BOWER. In reference to what is stated about the ammonium sulphate industry by Mr. MacDowell, that the ammonium sulphate industry will supply all of our needs, I find that propaganda sheet No. 2 and sheet No. 3 and sheet No. 4 are all based on the ammonium sulphate industry supplying the demands of the American farmer. I would like to put in the record an editorial from the Oil, Paint, and Drug Reporter, which is their authority in their entire propaganda in reference to securing information as to prices. I would like to put into the record this editorial from that paper, taken from the issue of Monday, January 23, 1922. It is headed, "Opportunity calls to nitrate." It says:

"Conditions incident to several industries have brought about a shortage of ammonium sulphate. Resumption of normal activity in producing circles has been slow, but apparently it was not, for a time, slow enough. So it came to pass that at a time when the manufacturers of fertilizer mixtures in which ammonium sulphate is a component were not ready to undertake extensive operations, stocks of that chemical had piled up in producers' hands to such an extent that, curtailment of production entailing utter waste of a valuable by-product, unloading tactics were in order. As is customary in such a state of affairs, the price of sulphate was reduced to a comparatively attractive figure. The American buyers, however, were not in a purchasing mood, and foreign interests gobbled up the supply. Now, when the apathy, or despondency, or pessimism of domestic consumers has been somewhat dissipated, and they feel a need for perhaps limited amounts of sulphate, there is practically none to be had.

"This situation, which supplies new evidence of the influence of industrial interdependence, is avidly seized upon in certain circles to point a moral as to what may happen to American industries of many sorts. Some are vociferously declaring that the domestic ammonium sulphate producers face a future of gloom if not of extinction. A parallel is drawn with the position of American producers of potash, and it is asseverated that domestic consumers of sulphate will follow the example of potash users—they are largely the same folks—and turn to Germany for their supplies, leaving the American producer high but not dry, rather bathed in cold perspiration.

"Some months ago there might have been every reason to accept this direful prediction. But, with the destruction of the Oppau nitrogen plant, Germany has been left somewhat in the background in the ranks of producers of ammoniates. As a shortage of ammonium sulphate, similar to that in this country, prevails in Great Britain, and for similar reasons connected with production, little relief offers in that direction. Meanwhile, the Muscle Shoals deadlock remains unbroken.

"Is the condition serious? To a certain extent, yes. But we are inclined to look upon it as an ill wind which will blow good to the Chilean nitrate oficinas. The result, doubtless, will be a higher cost of fertilizers, containing nitrogen, for the supply of organic ammoniates, vegetable, animal, or fish is not such as to promise relief from the ammonium sulphate shortage. Chilean saltpeter seems to have another inning coming.

"The obligatory change from ammonium sulphate to sodium nitrate as the source of nitrogen for fertilizing purposes, at least, may be expected to be but temporary. If the producers of the former desire to regain the market their success of recent date in that direction will be in their minds. It may well be that they look to other fields for consuming demand. Of course, they may have to revise their point of view because of the development of a domestic nitrogen fixation industry, but, apparently, they now are content to supply the customers who were ready to buy when they earnestly desired to sell. It is

certain that they can not increase production, the genesis of their product decreases otherwise. It is not their fault that domestic consumers did not get the supplies recently available. Chile may yet get in funds."

You will notice their reference to coke there. That is, the coke-oven industry can not increase to meet the demands for fertilizer unless there is a demand for coke. That is from the issue of January 23, 1922.

Mr. MacDowell, representing the National Fertilizer Association, said that until the farmers use fertilizer materials more than at present there will be no use for the plant. But the amount we need is dependent upon the price, or the "more" we need is dependent upon the price, and if the price remains high we can not use the "more." So on a basis of maintaining high prices for nitrogen, they will not let us use our proper amount in our soils. But if this plant will lower the price of nitrogen, its entire production will be consumed by the American farmer with avidity. Then he stated that the best way to get the fertilizer price down was to buy more of it. That is a nice circle on which to start the farmer chasing around; that is to say, if he buys more fertilizer he will get it at a lower cost, and if he gets it at a lower cost he will buy more of it. Where do we get on that circle if we are to start going around? We want to get somewhere. Also that the cost is only incidental to the farmer; but we do not see any solution in getting his proposition started. In refutation of what he stated, the biggest tonnage the fertilizer manufacturers ever produced or the biggest tonnage ever produced by the fertilizer association was in 1918, when it was 8,000,000 tons. I submit that the prices of fertilizer in 1918 were the highest they ever had. So it does not follow that if we use a lot of fertilizer we get cheap fertilizer. In 1918 the price of farm products was high, and the farmers could afford to buy high-priced fertilizers, and they did, and now that the prices of farm products have dropped the consumption of fertilizer has virtually ceased, and instead of building up the fertility of the soil we are mining it and not putting anything back. But he supposes that the farmers could use these superphosphates. He stated that they ship that stuff to New Zealand. I do not know what the New Zealand people did with it. Of course, what they shipped to New Zealand, on account of the high freight charges, was the superphosphates; they shipped the 40 and 45 per cent material to New Zealand instead of the 16 per cent.

The American Fertilizer Handbook for 1920, page 39, has this statement:

"The Ammo-Phos works in New York Harbor was in steady operation during the year, practically all of the output going into the export field. This product, which is made in two grades, one containing about 13 per cent ammonia with 48 per cent available phosphoric acid and the other 20 per cent ammonia with 20 per cent available phosphoric acid, commands a premium in the export trade on account of its high concentration of plant food with corresponding reduction in transportation costs."

The production of high-grade materials of that character at Muscle Shoals will correspondingly reduce our freight rates, as well as the export freight rates, which these gentlemen would have to pay in shipping their fertilizers abroad. They ship these high concentrates out of the country and leave us the low concentrates with the high freight rates.

Mr. MacDowell stated that plants required a balanced ration, and that the 2-8-2 and 3-0-3 were good fertilizers. I would like to give you a little table of the food requirements of plants. Thirty bushels of wheat require 35 pounds of nitrogen, 15 pounds of phosphoric acid, and 9 pounds of potash; 75 bushels of corn require 60 pounds of nitrogen, 20 pounds of phosphoric acid, and 16 pounds of potash; 60 bushels of oats require 40 pounds of nitrogen, 16 pounds of phosphoric acid, and 11 pounds of potash; 4 tons of alfalfa require 190 pounds of nitrogen, 43 pounds of phosphoric acid, and 178 pounds of potash; and 2½ tons of clover require 103 pounds of nitrogen, 20 pounds of phosphoric acid, and 82 pounds of potash. So the 2-8-2—that is, 2 per cent nitrogen and 8 per cent of phosphoric acid—is not a balanced ration for a plant.

What has established that formula? The price. They can not put 10 per cent of nitrogen in there and furnish fertilizer at a price at which the farmer can buy it, because the nitrogen is the most expensive element. Where we only go to 2 and 8 per cent of nitrogen the total fertilizer bill is made up of over half on the nitrogen cost, and the other two items, the phosphoric acid and the potash, make up the other half. He says we do not consume it and that the lower grade of 2 per cent and 3 per cent are what we need. The reason it is 2 and 3 per cent is because it is sold on a tonnage basis. If he puts 10 per cent in, the price goes up and the farmer can not use it, and

he does not buy it. But they balance it on the basis of the price of material and the profit they can make out of selling a ton. That is what we are trying to get away from. That is one of the reasons why we have hope of getting an increased percentage in commercial fertilizer out of Mr. Ford's proposition. We would like to get away from the 2-8-2 and the 3-9-3; we would like to get some of these superphosphates, because if we can cut our freight rates we can get our product on much more advantageous terms. We would have a saving in price; it might not be in the factory cost, but if you make ammonium phosphate and sell it to the farmers direct, the saving between the factory door and the farm would put that plant food on the farmers' soil at half the price. If the factory cost was on a parity per unit of plant food the saving of warehousing, hauling, and the dealer's profits, based on a per ton cost on a high-grade material all of those elements of cost would be reduced to one-sixth after it leaves the factory door, and by the time it gets to the farm I venture to say it will be not over half the price of the former cost, and the identical thing would be true on all the high-grade material.

Now, with reference to the grades, I declare that sometimes I do not know what kind of a game the fertilizer people are trying to put on the farmer. In this Survey of the Fertilizer Industry, Bulletin No. 798, of the United States Department of Agriculture, dated October 20, 1919, on page 14, there is a table showing the distribution of fertilizer purchased in 1917, by grades. Starting at the beginning of that table there are four columns of grades, different combinations of nitrogen, phosphorus, and potash, that they have foisted off on the American farmer, and there is a total of 218 grades actually listed, with the percentage that each grade bears to the total, and of the 218 grades they made up 95.85 per cent of the fertilizer. Then at the end it says, "All other grades (724 grades) made up 4.15 per cent." That is not an intelligent proposition.

Then, in addition to that we have the brands. In the Federal Trade Commission's report on the fertilizer industry issued in 1916, on page 219, it lists the brands of fertilizer in the Southern States. We find there that the Virginia-Carolina Chemical Co. put on the market in Georgia 999 different brands of fertilizer, all made up of 2-8-2 and 3-9-3, and lots of it goes down to one-half per cent of nitrogen. So the farmer would never get as much as a pound on his soil after you had bought it, and yet that company, which comes here and asks you to protect their interest, registered 999 brands in one State to sell to the farmers; and the Armour Fertilizer Works, of which Mr. MacDowell is president, registered 977 additional brands. So that company would sell the farmer fertilizer on a tonnage basis and keep him away from the knowledge of what this plant food is, and continue this proposition of putting out, as this table I have showed you shows, this tremendous amount of different grades of this material. You will find that 52.79 per cent of all grades that went to the farmer is made up of 12 per cent or less of plant food. That is to say, in buying a ton of fertilizer we only get 240 pounds of fertilizer out of 2,000 pounds of material.

We have had a lot of talk about fillers. It is not the filler. I will not go that far in criticizing the fertilizer industry. That is not the crux of the situation.

Let me show you what they do. Take, for instance, the 2-8-2 grade. Let me read you this from this survey of the industry:

"If it is desired to make a mixture containing 2 per cent of ammonia, 8 per cent of phosphoric acid, and 2 per cent of potash (the well-known grade 2-8-2) and the materials at hand are cottonseed meal, containing 7 per cent of ammonia; acid phosphate, containing 16 per cent of phosphoric acid; and Nebraska potash, containing 28 per cent of potash, the method of making up the mixture will be as follows: Two per cent of a 2,000-pound ton is 40 pounds; in order to obtain 40 pounds of ammonia from 7 per cent cottonseed meal it will be necessary to use 571 pounds of cottonseed meal. The amount of phosphoric acid desired is 8 per cent of a ton or, in fertilizer parlance, 8 units, or 160 pounds. To obtain 160 pounds from a 16 per cent acid phosphate will require 1,000 pounds of acid phosphate. The amount of potash called for is 40 pounds and to obtain that from a 28 per cent material 143 pounds will be required. The total amount of materials used, therefore, will be 571 plus 1,000 plus 143, or 1,714 pounds. To this are added 286 pounds of filler in order to make up the ton."

The filler is not the great big thing in that, but they put in the 286 pounds of filler to make up the ton, and then you have the ton of 2-8-2. But they

start with the cottonseed meal which carries 7 per cent of nitrogen, and then they have the acid phosphate which carries only 16 per cent of nitrogen. If we can get this proposition of ammonium nitrate carrying 35 per cent of nitrogen, and you will find that the superphosphate carries as high as 60 per cent of phosphorus, and if you take that kind of material and fix it you will get away from the necessity of the 2-8-2 stuff. But you can not get away from it without developing these high compound materials to start with. That is why I say you have to quit using the low-grade stuff, and you have to jump the creek in one jump; you can not do it step by step in a slow process.

"While it is likely that in the 5,000,000 tons of fertilizer produced in 1918 more than 270,000 tons of filler were used, the filler constituted only a small proportion of the inert matter in the mixture. Thus, in the examples, the 2,000-pound ton contained 286 pounds of filler, while the total of inert matter was as follows: Of the 571 pounds of cottonseed meal, 531 pounds were inert; of the 1,000 pounds of acid phosphate, 840 pounds were inert; and of the 143 pounds of Nebraska potash, 103 pounds were inert; so that the total inert matter in the plant-food carrying materials was 1,474 pounds; and the ton of fertilizer consisted of 240 pounds of plant food, 1,474 pounds of inert matter in the plant-food carrying material, and 286 pounds of filler."

That filler would not be so awfully bad if we could get away from the 1,474 pounds of inert material in the plant-food bearing compounds, which made up 1,714 pounds of our ton, and that is exactly what we are trying to do through the operation of this plant.

The National Fertilizer Association has continuously opposed this development. It opposed it when it was a proposition of Government operation. I have the report here of the twenty-eighth annual convention of the National Fertilizer Association, held at White Sulphur Springs June 20-23, 1921, and on page 34 we have the report of the Washington office of the association. In discussing the bill before Congress for the operation by the Government of the Muscle Shoals nitrate plant, the report says:

"This bill was favorably reported by the Senate Committee on Agriculture, and under the leadership of Senator Underwood of Alabama was forced through the Senate, although certain important amendments offered by Senator Wadsworth of New York were adopted. Those amendments would require the corporation to assume interest payments on a bond issue to be purchased by appropriation in the bill, and whenever such payments defaulted the enterprise would have to cease. Even that form of the bill was objectionable; and we continued our opposition to it. When the bill went to the House, Chairman Kahn, of the Military Affairs Committee, decided that in view of the congested condition of the calendar it would be a hopeless task to try to obtain consideration for it, and it died in committee with the expiration of the Congress on March 4."

It came to life again when Mr. Ford made his proposition to take it over, and they are here now fighting that proposition in every way possible. You will notice that they do not object to the Alabama Power Co.'s proposition. Mr. MacDowell stated he was in favor of the water power, but he said, "Do not operate the nitrate plants; you will make a bad bargain if you do that." But the farmers will not make a bad bargain if you do that, and we ask for your acceptance of the Ford proposition, because we feel that he will do these things. You can cooperate in doing them, and we believe what is proper Government cooperation in the first case is proper cooperation in connection with Mr. Ford's offer. I want to call your attention to the fact that Mr. Ford, on his own initiative, suggested in his first proposition, which the farmers never knew was coming, that a board of farmers sit in with him in carrying out this proposition. That came from him; we had never talked to him about it. It is the first time the farmers ever have been asked to sit in with any corporation that was furnishing them any material, to see that they were getting a square deal. We believe we will get it. If we do sit in with Mr. Ford in connection with the operation of this plant, we will get a square deal and we will get the results we seek, and we will have practically a new policy on the water-power development. That is one of the big things. There will be plenty of power for the fertilizer industry, and there will be other water power developed, and we will jump this creek in one jump. That is what Mr. Ford intends to do, and he will do it.

Then, too, we will go a long step forward in the solution of our soil-fertility problem.

In closing, I would like to quote once more from Theodore Roosevelt. In the Outlook of September 7, 1912, he wrote:

"The Government must cooperate with the farmer to make the farm more productive. There must be no skinning of the soil. The farm should be left to the farmer's son in better and not worse condition because of its cultivation. Moreover, every invention and improvement, every discovery and economy, should be at the service of the farmer in the work of production."

Gentlemen, he must have visualized the very question which this committee is called upon to decide when he made that statement. We are asking that this invention, this discovery of the fixation of air nitrogen, be placed at our disposal to protect the fertility of our soil.

I thank you very much, Mr. Chairman and gentlemen.

Mr. McKENZIE. Mr. Bower, I understand that you, like Mr. Silver, are here representing the farmers of the United States?

Mr. BOWER. I represent the American Farm Bureau Federation. The Farmers' Union have also indorsed this proposal by resolution, and the National Grange is with us on this proposition.

Mr. McKENZIE. In section 14, "the company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control." Do you consider that the paramount element of consideration in Mr. Ford's proposition?

Mr. BOWER. I do not know, Mr. McKenzie, whether that element is paramount or whether section (a), following that, is paramount. But taken together they make a combination which has a very strong appeal to the American farmers. That paragraph (a) would provide for research in connection with the electric-furnace proposition and what it will do, along the lines that Mr. Swann and Dr. Whitney have testified about before the committee.

Mr. McKENZIE. The Alabama Power Co., in paragraph 2 of its proposition, states as follows:

"2. The company offers to furnish the Government, or anyone it may designate, with free power in the amount of 100,000 secondary horsepower for the production of fertilizer and munitions of war and research in connection therewith; and if for any reason this use of the power is discontinued the company will purchase same. This feature of the offer has the advantage of providing the Government a return on the \$17,000,000 it now has invested in the water-power project." So far as the Alabama Power Co. is concerned, is there any indication of a guarantee that they will engage in the manufacture of fertilizer?

Mr. BOWER. Absolutely none whatever.

Mr. McKENZIE. Or any ingredient?

Mr. BOWER. None whatever. I wish to call your attention to the report of the Secretary of War in connection with it. He calls attention to the advantage of that 100,000 secondary horsepower as being a return on the \$17,000,000 expended, evidently understanding thoroughly that the nitrate plant was not to use the 100,000 horsepower, and the Government would sell it and get a return on the \$17,000,000.

Mr. McKENZIE. The Alabama Power Co. is pretty thoroughly entrenched in that section of the country, is it not?

Mr. BOWER. I understand so; I am not familiar with that situation. But the thought with us is that the Alabama Power Co. with its old association with and interlocking officers in the American Cyanamid Co., and the American Cyanamid Co. being so closely connected with the Virginia-Carolina Chemical Co., and the Virginia-Carolina Chemical Co. being so closely connected with the cottonseed meal concern, the whole thing is tied in together.

Mr. McKENZIE. The proposition of the Alabama Power Co. is to turn over to the Government 100,000 secondary horsepower?

Mr. BOWER. According to the flow of the river. We do not even get secondary horsepower through the use of the steam plant at all.

Mr. McKENZIE. That involves, if you will permit me, either governmental operation of the nitrate plant or operation by a lessee of the Government.

Mr. BOWER. Limited to 100,000 horsepower, which he would have to shut down perhaps four, or five, or six months of the year.

Mr. McKENZIE. Having in mind the evidence submitted to this committee bearing on the contract on which the Alabama Power Co. pretends to stand

now, in which the Government of the United States would be estopped from exercising its function, what is your judgment as to the prospective extent of either Government operation of the nitrate plant or operation by a licensee of the Government, when subjected to the will of the Alabama Power Co. for its power?

Mr. BOWER. None whatever; and not only that, but you have no assurance of power to operate.

Mr. McKENZIE. Mr. Ford's proposition so far as that is concerned, is a straightforward, direct contractual proposition to engage in that business, not with the secondary power, but with the primary power.

Mr. BOWER. With enough power to operate at full capacity, either primary or secondary power; but if the secondary power gives out we get primary power because the plant goes at full capacity.

Mr. McKENZIE. I am not expressing any opinion in regard to the wisdom of the policy in Mr. Ford's contract, but I want your viewpoint, representing the farmers of the country. I take it, from the proposition of the Alabama Power Co. as I have read it, that, as a mere matter of dollars and cents, pawning your jewelry at a pawnshop, or selling something in order to get as much out of it at the time being as possible, it may be that the Alabama Power Co.'s offer is a better offer in the matter of dollars and cents then, perhaps, the offer of Mr. Ford.

Mr. BOWER. I would not agree to that promise.

Mr. McKENZIE. I want to ask you this question: Whether or not you gentlemen have studied this question, not alone from the standpoint of dollars and cents, and taken into consideration the fact that it is a proposition in which there is more involved than the \$5,000,000 Mr. Ford will pay for certain properties down there, but also that he binds himself in a continuing obligation to perform a duty or carry on an operation that will, in your judgment, I take, be of lasting benefit to the agriculturists of this country. Is that your position?

Mr. BOWER. Absolutely so.

Mr. McKENZIE. For that reason you do advocate the acceptance of the Ford offer?

Mr. BOWER. Exactly so.

Mr. McKENZIE. Having in mind not a mere monetary transaction but a monetary transaction coupled up with performance, to be performed hereafter along lines set out in the contract for the benefit of the agriculturists of this country?

Mr. BOWER. Yes, sir. I do not like it tied up with the better financial proposition. I do not agree with you if that is what is in your mind.

Mr. McKENZIE. We are not discussing that.

Mr. BOWER. Aside from that it is undoubtedly true, as evidenced by our activity and insistence last year, that this Government plant be operated at Government expense.

Mr. McKENZIE. Let me ask you this question: What is your judgment as to the fairness of a computation of cost, based on a straight-out cash proposition, without any conditions attached to it whatever, and an estimate of cost based on the proposition such as the Ford offer? Is there any comparison that you can draw that would be a fair one, in your judgment?

Mr. BOWER. I do not quite understand the intent of your question?

Mr. McKENZIE. If we sold the property directly to Mr. Ford for the amount stipulated and turned over the water power to him?

Mr. BOWER. Taking section 14 into consideration, as a proposition to maintain it for the Government?

Mr. McKENZIE. Yes. Is it fair in estimating the cost, or, putting it the other way, the benefits to Mr. Ford to figure as though it were a straight-out monetary proposition?

Mr. BOWER. No; I think you have other factors that come in there. Take the maintenance of the plant from that standpoint. The Army engineers have testified that the depreciation is \$2,500,000, and the cost of maintenance is \$200,000 a year; so there is \$2,700,000 of expense to the Government which Mr. Ford assumes, and in two years he will pay you more than you would get from the Alabama Power Co. in cash.

Mr. McKENZIE. In your judgment, this is not a proposition or a matter of dollars and cents in a trade between the Government and a purchaser?

Mr. BOWER. No, I do not think so. Then you should remember this: Suppose you agree to charge Mr. Ford 8 per cent interest on the water power. We farmers are going to pay that in the cost of our fertilizer. If you charge him \$20,000,000 for this nitrate plant the farmers will pay the interest on that in-

In closing, I would like to quote once more from Theodore Roosevelt. In the Outlook of September 7, 1912, he wrote:

"The Government must cooperate with the farmer to make the farm more productive. There must be no skinning of the soil. The farm should be left to the farmer's son in better and not worse condition because of its cultivation. Moreover, every invention and improvement, every discovery and economy, should be at the service of the farmer in the work of production."

Gentlemen, he must have visualized the very question which this committee is called upon to decide when he made that statement. We are asking that this invention, this discovery of the fixation of air nitrogen, be placed at our disposal to protect the fertility of our soil.

I thank you very much, Mr. Chairman and gentlemen.

Mr. McKENZIE. Mr. Bower, I understand that you, like Mr. Silver, are here representing the farmers of the United States?

Mr. BOWER. I represent the American Farm Bureau Federation. The Farmers' Union have also indorsed this proposal by resolution, and the National Grange is with us on this proposition.

Mr. McKENZIE. In section 14, "the company agrees to operate nitrate plant No. 2 at the approximate present annual capacity of its machinery and equipment in the production of nitrogen and other fertilizer compounds (said capacity being equal to approximately 110,000 tons of ammonium nitrate per annum) throughout the lease period, except as it may be prevented by strikes, accidents, fires, or other causes beyond its control." Do you consider that the paramount element of consideration in Mr. Ford's proposition?

Mr. BOWER. I do not know, Mr. McKenzie, whether that element is paramount or whether section (a), following that, is paramount. But taken together they make a combination which has a very strong appeal to the American farmers. That paragraph (a) would provide for research in connection with the electric-furnace proposition and what it will do, along the lines that Mr. Swann and Dr. Whitney have testified about before the committee.

Mr. McKENZIE. The Alabama Power Co., in paragraph 2 of its proposition, states as follows:

"2. The company offers to furnish the Government, or anyone it may designate, with free power in the amount of 100,000 secondary horsepower for the production of fertilizer and munitions of war and research in connection therewith; and if for any reason this use of the power is discontinued the company will purchase same. This feature of the offer has the advantage of providing the Government a return on the \$17,000,000 it now has invested in the water-power project." So far as the Alabama Power Co. is concerned, is there any indication of a guarantee that they will engage in the manufacture of fertilizer?

Mr. BOWER. Absolutely none whatever.

Mr. McKENZIE. Or any ingredient?

Mr. BOWER. None whatever. I wish to call your attention to the report of the Secretary of War in connection with it. He calls attention to the advantage of that 100,000 secondary horsepower as being a return on the \$17,000,000 expended, evidently understanding thoroughly that the nitrate plant was not to use the 100,000 horsepower, and the Government would sell it and get a return on the \$17,000,000.

Mr. McKENZIE. The Alabama Power Co. is pretty thoroughly entrenched in that section of the country, is it not?

Mr. BOWER. I understand so; I am not familiar with that situation. But the thought with us is that the Alabama Power Co. with its old association with and interlocking officers in the American Cyanamid Co., and the American Cyanamid Co. being so closely connected with the Virginia-Carolina Chemical Co., and the Virginia-Carolina Chemical Co. being so closely connected with the cottonseed meal concern, the whole thing is tied in together.

Mr. McKENZIE. The proposition of the Alabama Power Co. is to turn over to the Government 100,000 secondary horsepower?

Mr. BOWER. According to the flow of the river. We do not even get secondary horsepower through the use of the steam plant at all.

Mr. McKENZIE. That involves, if you will permit me, either governmental operation of the nitrate plant or operation by a lessee of the Government.

Mr. BOWER. Limited to 100,000 horsepower, which he would have to shut down perhaps four, or five, or six months of the year.

Mr. McKENZIE. Having in mind the evidence submitted to this committee bearing on the contract on which the Alabama Power Co. pretends to stand

now, in which the Government of the United States would be estopped from exercising its function, what is your judgment as to the prospective extent of either Government operation of the nitrate plant or operation by a licensee of the Government, when subjected to the will of the Alabama Power Co. for its power?

Mr. BOWER. None whatever; and not only that, but you have no assurance of power to operate.

Mr. McKENZIE. Mr. Ford's proposition so far as that is concerned, is a straightforward, direct contractual proposition to engage in that business, not with the secondary power, but with the primary power.

Mr. BOWER. With enough power to operate at full capacity, either primary or secondary power; but if the secondary power gives out we get primary power because the plant goes at full capacity.

Mr. McKENZIE. I am not expressing any opinion in regard to the wisdom of the policy in Mr. Ford's contract, but I want your viewpoint, representing the farmers of the country. I take it, from the proposition of the Alabama Power Co. as I have read it, that, as a mere matter of dollars and cents, pawning your jewelry at a pawnshop, or selling something in order to get as much out of it at the time being as possible, it may be that the Alabama Power Co.'s offer is a better offer in the matter of dollars and cents then, perhaps, the offer of Mr. Ford.

Mr. BOWER. I would not agree to that promise.

Mr. McKENZIE. I want to ask you this question: Whether or not you gentlemen have studied this question, not alone from the standpoint of dollars and cents, and taken into consideration the fact that it is a proposition in which there is more involved than the \$5,000,000 Mr. Ford will pay for certain properties down there, but also that he binds himself in a continuing obligation to perform a duty or carry on an operation that will, in your judgment, I take, be of lasting benefit to the agriculturists of this country. Is that your position?

Mr. BOWER. Absolutely so.

Mr. McKENZIE. For that reason you do advocate the acceptance of the Ford offer?

Mr. BOWER. Exactly so.

Mr. McKENZIE. Having in mind not a mere monetary transaction but a monetary transaction coupled up with performance, to be performed hereafter along lines set out in the contract for the benefit of the agriculturists of this country?

Mr. BOWER. Yes, sir. I do not like it tied up with the better financial proposition. I do not agree with you if that is what is in your mind.

Mr. McKENZIE. We are not discussing that.

Mr. BOWER. Aside from that it is undoubtedly true, as evidenced by our activity and insistence last year, that this Government plant be operated at Government expense.

Mr. McKENZIE. Let me ask you this question: What is your judgment as to the fairness of a computation of cost, based on a straight-out cash proposition, without any conditions attached to it whatever, and an estimate of cost based on the proposition such as the Ford offer? Is there any comparison that you can draw that would be a fair one, in your judgment?

Mr. BOWER. I do not quite understand the intent of your question?

Mr. McKENZIE. If we sold the property directly to Mr. Ford for the amount stipulated and turned over the water power to him?

Mr. BOWER. Taking section 14 into consideration, as a proposition to maintain it for the Government?

Mr. McKENZIE. Yes. Is it fair in estimating the cost, or, putting it the other way, the benefits to Mr. Ford to figure as though it were a straight-out monetary proposition?

Mr. BOWER. No; I think you have other factors that come in there. Take the maintenance of the plant from that standpoint. The Army engineers have testified that the depreciation is \$2,500,000, and the cost of maintenance is \$200,000 a year; so there is \$2,700,000 of expense to the Government which Mr. Ford assumes, and in two years he will pay you more than you would get from the Alabama Power Co. in cash.

Mr. McKENZIE. In your judgment, this is not a proposition or a matter of dollars and cents in a trade between the Government and a purchaser?

Mr. BOWER. No, I do not think so. Then you should remember this: Suppose you agree to charge Mr. Ford 8 per cent interest on the water power. We farmers are going to pay that in the cost of our fertilizer. If you charge him \$20,000,000 for this nitrate plant the farmers will pay the interest on that in-

Mr. PARKER. They were working that at a larger capacity when it exploded;

Mr. BOWER. Not larger than the total cyanamid production.

Mr. PARKER. On the whole, were they not operating the Haber process much more than the cyanamid process?

Mr. BOWER. The cyanamid process was operated to the full capacity.

Mr. PARKER. Which was producing the more?

Mr. BOWER. I could not give you those figures.

Mr. CROWTHER. You said that what the farmers wanted was nitrogen, and the cheapest method, the one everybody looked forward to, was the air reduction method?

Mr. BOWER. Yes, s'r.

Mr. CROWTHER. Mr. Ford does not intend to run an air-reduction plant, does he?

Mr. BOWER. Cyanamid is produced by an air-fixation process; there is no nitrogen except through the air-fixation process.

Mr. CROWTHER. The Haber process was supposed to be a very cheap method, was it not?

Mr. BOWER. It was supposed to be.

Mr. CROWTHER. And the plant would run with 20,000 horsepower, as compared with the 100,000 horsepower it takes to run the other plant?

Mr. BOWER. When it runs.

Mr. CROWTHER. That proved a failure?

Mr. BOWER. Yes.

Mr. CROWTHER. Do you think it would be a good thing to have a plant down there with all that explosive material around it, and all the other shops around it?

Mr. BOWER. I do not think so, and I think that is the reason Mr. Ford would not obligate himself to operate that plant.

Mr. CROWTHER. You are going to make the ammonium nitrate and turn it into ammonium sulphate?

Mr. BOWER. Not at all.

Mr. CROWTHER. All you are going to make is ammonium nitrate, and turn it into ammonium sulphate?

Mr. BOWER. Not at all.

Mr. CROWTHER. What else are you going to make?

Mr. BOWER. I have tried to explain the possibilities of manufacturing down there. Mr. Ford says nitrogen and other fertilizer compounds. According to one of the provisions of this contract he proposes to carry on research along the line that Mr. Swann, Dr. Whitney, and Dr. Tollman have told you are possible.

Mr. CROWTHER. Mr. Ford told you this?

Mr. BOWER. I think it is in the intent of the contract.

Mr. CROWTHER. You talked about a subsidy. It has been testified to here that that concern could run the ammonium nitrate plant at a considerable loss and get its profits from the immense water power development and other industries that might be tremendously profitable.

Mr. BOWER. That might be true.

Mr. CROWTHER. Then, there would not be any force to the subsidy proposition if they could balance the loss with their profits on the other thing, when you say they are crying that they could not operate it at a profit.

Mr. FIELDS. In regard to the filler material in fertilizer, in the 2-8-2 formula which you referred to, I believe you said there were 1,474 pounds of inert matter?

Mr. BOWER. Inert matter in the plant food-bearing material, and in addition to that they have filler, too.

Mr. FIELDS. You use filler?

Mr. BOWER. To make up the ton.

Mr. FIELDS. After all, this amount of inert matter such as filler has no plant food value?

Mr. BOWER. It has no plant-food value.

Mr. FIELDS. Whichever way they take it, after all, it amounts to the same as filler?

Mr. BOWER. Yes; but the word filler has a kind of bad meaning, that they put that stuff in to make it low grade. The crux of the thing is in the highly concentrated materials that we want.

Mr. FIELDS. This inert matter has no more plant-food value than the 236 pounds put in as filler?

*Mr. BOWER. No, sir; in fact, it is often detrimental. The sulphuric acid proportion is even harmful.

Mr. FIELDS. Whatever you call it, if you could get away from it and could get down to the more highly concentrated fertilizers the farmers would be relieved of the expense of the freight charges, handling, bagging, and everything else that goes into the carrying of that inert matter or filler to the farm.

Mr. BOWER. Exactly so.

Mr. QUIN. The nitrogen is more costly than either the potash or the phosphoric acid, is it not?

Mr. BOWER. Yes, sir.

Mr. QUIN. What do you mean by the term unit in connection with fertilizer?

Mr. BOWER. I do not want to start to complicate this fertilizer question by introducing new terms. A unit is 1 per cent of a ton, or 20 pounds. The reason they use that is so they can compare the value of the various nitrogen fertilizers. The Chilean nitrate carries 16 per cent, and they say that is 16 units, 1 per cent being a unit. If they want to compare the price of nitrate of soda with ammonium sulphate they divide the price per ton by the percentage, which gives them the price per unit, so you can compare the two in that way. It is not fair to compare the price of a ton of nitrate of soda with a ton of ammonium sulphate, because the nitrate of soda carries 17 per cent and ammonium sulphate carries as high as 25 per cent.

Mr. QUIN. I wanted to get that information for the record.

The CHAIRMAN. I want to ask you one question: Most countries speak of the short ton as the standard ton, but I understand in buying Chilean nitrate it is sold by the long ton of 2,240 pounds?

Mr. BOWER. It is not sold to the farmer on a long-ton basis. We buy a short ton.

Mr. PARKER. The metric ton is nearly a long ton.

Mr. BOWER. Yes.

Mr. PARKER. All coal and iron are sold by the long ton?

Mr. BOWER. Yes; I believe so.

Mr. QUIN. According to your statement somebody hogs the farmer out of 200 pounds on the ton.

Mr. BOWER. Not necessarily; the price could be adjusted accordingly. That would not necessarily follow.

Mr. QUIN. On the unit basis at the present cost nitrogen would be \$9 on the 3-9-3 formula; nitrogen would be \$9, phosphoric acid would be \$50, and potash would be \$80? That is on the 3-9-3 formula.

Mr. BOWER. I do not know where that comes from. What is your price for the commercial fertilizer?

Mr. QUIN. That is the present market price.

Mr. BOWER. It would depend upon the sources of that nitrogen somewhat, too. I would not want to say those figures were definitely correct.

Mr. QUIN. What I am driving at is that Mr. MacDowell, the president of the National Fertilizer Association, appeared before this committee, and they had sent out to the Congressmen and, I guess, to other people a document wherein they set up that only 4 cents out of the dollar of the cost of fertilizer was for ammonium sulphate. Now, what percent of nitrogen is in ammonium sulphate?

Mr. BOWER. It depends upon what materials they use in making their mixed fertilizer. They might use ammonium sulphate or they might use nitrate of soda or they might use cottonseed meal. If they use cottonseed meal there would be 1 per cent and if they use ammonium nitrate there would not be any ammonium sulphate in it. The trouble with that proposition is that he does not figure, as we do, that if we cheapen the cost of nitrogen from one source we will cheapen the other sources, and if we cut the price of ammonium sulphate, as an illustration, way down we are going to cut the price of nitrate of soda and we are going to cut the price of nitrogen in cottonseed meal and the other sources, and there is where the whole thing falls down. Then, of course, he has figured in all the expense of bagging and mixing and hauling and carrying all this business out to the farm, and that does not have anything to do with the statement that the ammonium sulphate only costs 4 cents of the farmer's dollar.

Mr. QUIN. That was intended for the purpose of making it appear, and they said so, that this nitrogen at Muscle Shoals would not reduce the price of fertilizer, no matter how cheaply they produced it. What percentage of phosphoric acid on that sort of a basis would be in there?

Mr. BOWER. I could not tell you that, Mr. Quin. In the mixed-fertilizer goods phosphoric acid runs around 8 per cent of the total right along. It averages, possibly, a little better than that. It would run better than that, because a great deal of 16 per cent acid phosphate is sold as such, the farmer not being able to buy any nitrogen at all. We in Virginia can not afford to buy nitrogen except for our truck crops, and we buy 16 per cent acid phosphate and grow a clover crop and plow it under to get our nitrogen, but that is pretty expensive, and it about breaks a farmer's heart to plow under a good crop of clover when he sees the price of hay going up. That is the difficulty with that method of obtaining nitrogen. The farmer makes up his mind. "Yes; I am going to do that," and then about the time the clover crop gets up about a foot and a half high and the hay is a little short in his barn, instead of putting a plow in there he puts in a mower about 50 per cent of the time, and it does not get plowed under.

Mr. QUIN. In this method, you have three ingredients of fertilizer—there would also be potash; would the same analysis apply to that?

Mr. BOWER. Let me see that statement and see if I can straighten this out at all. [Reading:]

"Small part of fertilizer bill would be affected by operation of Muscle Shoals plant; 96 cents for other necessary ingredients, such as organic ammoniates, nitrogen, potash, phosphoric acid, etc., and for mixing, bagging, freights, and other necessary costs."

I do not believe I can unravel that for you, Mr. Quin, because I do not know what those mixing, bagging, and other costs are, and without that it would be pretty hard to figure what was the percentage of the potash cost or anything else.

Mr. QUIN. Different types of soil need different kinds of fertilizer, as you illustrated this afternoon, and different plants need different fertilizers.

Mr. BOWER. Yes; and the whole proposition is there. For instance, we can get along on our big alluvial and loessal soils of the Middle West and the corn belt section, because that soil is black with nitrogen. The humus is a large carrier of nitrogen, and that soil can grow crops without nitrogen applications, and we are doing it; but when you come down to our sandy soils of the coastal plains, in the trucking sections, you have got to give it all the nitrogen that the plants get, because there is not any in the soil.

Mr. QUIN. And all of these different 970 brands of fertilizer from one factory and about that many from another are merely deceptive processes so far as—

Mr. BOWER. I would not say that, exactly.

Mr. QUIN. Do we need that many brands?

Mr. BOWER. Oh, no; and it is a tremendous burden on us, but it is also done to protect their dealers; that is, one fertilizer manufacturer may have two or three different dealers in the same town, and in order that they do not figure they are competing with one another, one will carry one brand of 3-8-3 and another will carry another brand of 3-8-3, and they are identical material, but one is selling the Old Buck Corn Booster and the other is selling Royal Potato Sprouter, and that is the idea on which they are sold to the farmer, and it is an insult to the intelligence of the farmer to handle this thing in that way. And it is a burden upon us to have these low-grade materials compounded in so many ways, with all this different sacking and branding and bagging, and everything of that sort.

Mr. QUIN. Mr. Bower, these dealers all get a profit on the fertilizer they handle, do they not?

Mr. BOWER. Yes, sir.

Mr. QUIN. Then, the farmer starts out with the high freight on the filler, and then he comes to this drummer that sells it to the dealer, and then to the dealer for his profit, and then has his wareroom expenses, and then the farmer comes to town and says, "I want you to run me, Mr. Smith, this year," getting his fertilizer after paying the drummer's expense and the dealer's expense.

Mr. BOWER. And a big interest rate.

Mr. QUIN. On top of insurance charges and so on. Then, if this proposition of Mr. Ford goes through, and there is a cooperative method of handling it, would not that cut out the drummer's expense and the dealer's expense?

Mr. BOWER. Undoubtedly, if we can handle it in a cooperative way. That is one of the things, as Mr. Silver stated, we are having under consideration, the recognition of the cooperative purchasing of the product. We do not presume to say we can come here and take all of that product away from Mr. Ford's

plant through cooperative organizations, but we are going to try and take just as much as we can to get away from that practice, and with the present fertilizer industry we have had a time and a half getting them to deal with cooperative enterprises at all. A good many of them will not quote us.

Mr. QUIN. They are not encouraged by them to say the least.

Mr. BOWER. Not at all.

Mr. QUIN. Mr. Bowers, the Virginia-Carolina Chemical Co. mentioned by you sells fertilizer in several States, does it not?

Mr. BOWER. Oh, yes; it is one of the large fertilizer manufacturing concerns.

Mr. QUIN. Is this Mr. Duke connected with that concern?

Mr. BOWER. Yes; he owns a controlling interest in the Virginia-Carolina Chemical Co.

The CHAIRMAN. I think that has been testified to a half a dozen times.

Mr. QUIN. The American Cyanamid Co. man told me not.

The CHAIRMAN. Mr. Duke owns 26 per cent of the stock.

Mr. QUIN. In the American Cyanamid Co., but this man denied his having any interest in the Virginia-Carolina Chemical Co.

The CHAIRMAN. No; I think it was testified he had an interest in that company also.

Mr. QUIN. What percentage does he own in the American Tobacco Co.?

Mr. BOWER. I have not any idea.

Mr. QUIN. Mr. Bower, you stated that Mr. Washburn was president of the cyanamid company at the time he made these statements before this committee.

Mr. BOWER. He was.

Mr. QUIN. And that statement was to the effect that for the Government to cooperate with them in the proposition that 3 per cent would be a fine thing.

Mr. BOWER. He called it proper Government cooperation.

Mr. QUIN. Is this proposition Mr. Ford has made this committee to be decided as improper under any construction of the language used by Mr. Washburn?

Mr. BOWER. I could not understand it so; no.

Mr. QUIN. It would be illogical to construe it in that way?

Mr. BOWER. Absolutely so. If it was a proper Government cooperation with them in 1916, they would have to admit it is proper Government cooperation now with Mr. Ford, and Mr. Ford is paying 1 per cent more interest than they offered.

Mr. QUIN. There is no doubt in your mind as a representative of the farmers as to the language used in this contract touching the fertilizer part of it, is there?

Mr. BOWER. No; there is no doubt in our minds. Some of our friends who feel they want to protect us a little further suggest we might get a little clarification of that language; not a change in the contract, but in order to make what we are absolutely confident is Mr. Ford's intention and purpose a little clearer in the contract, we are discussing with Mr. Ford's general representatives some possible clarification along that line, and I believe that will be adjusted satisfactorily to everyone.

Mr. QUIN. As a practical proposition, with different crops requiring different formulas, some as you stated needing more nitrogen than others, it would be a fatal mistake to set up in a contract what formulas ought to be used or made?

Mr. BOWER. Absolutely so. It would not be possible to do so.

Mr. QUIN. It would just ruin it so far as the farmers' interests are concerned.

Mr. BOWER. It might absolutely ruin it and it would not be possible. The 110,000 tons of ammonium nitrate is taken by us as a measure of the amount of production, not as a product, and it says so, as we read it, "taken at 110,000 tons of ammonium nitrate per annum," that is a measure, a yardstick on his production. That is the amount of nitrogen he will produce.

The CHAIRMAN. I think that has been testified to before the committee half a dozen times.

Mr. BOWER. I think so, Mr. Kahn.

Mr. QUIN. Mr. Bower, as a representative of the farmers of the country, could you consider the Alabama Power Co.'s proposition as compared with the Ford proposition?

Mr. BOWER. Not at all. From the farmer's standpoint there is no comparison.

Mr. QUIN. And the Ford proposition is satisfactory to them?

Mr. BOWER. Absolutely so.

Mr. QUIN. And as you have stated, he suggested the language that is carried in this contract of his own volition and made it acceptable to the farmers without consulting them.

Mr. BOWER. I think I stated that clearly. Section 15 is the one that refers to the farmers' organizations and Mr. Ford himself, without any suggestion from any farmers that I know of at all, suggested that a board of farmers sit in with him and, as we feel, help work this thing out. He says that we shall even go over his books and find out what his costs are. I think that is a clear indication of his intent, and is an indication of what he is going to do down there. You do not invite farmers to go over your books if you are going to put something over on them because there would be a howl go up at once.

The CHAIRMAN. If there are no further questions, we are very much obliged to you, Mr. Bower.

(The committee thereupon adjourned until Friday, February 24, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Friday, February 24, 1922.

The committee met at 10.30 o'clock a. m. Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. I want to inform the committee that Mr. Hugh L. Cooper has sent to me an analysis of his statement, as follows:

HUGH L. COOPER & Co.,
New York, February 21, 1922.

Hon. JULIUS KAHN,

*Chairman Military Affairs Committee,
House of Representatives, Washington, D. C.*

DEAR SIR: 1. Agreeable to the promise I made to the House Military Affairs Committee on Friday, February 17, I desire to submit the following analysis justifying the statement I made before the committee that the cost to the United States Treasury would be in reality \$1,275,000,000 over and above the amount of money received from Mr. Ford should Mr. Ford's proposal be accepted as now before the committee.

2. The above figure of \$1,275,000,000 was arrived at, as stated in my testimony, by compounding the 4 per cent interest charge annually. Since my return to my office I have ascertained that all money borrowed by the United States Government carries semiannual interest payments instead of annual interest payments. I have therefore recomputed this Treasury deficit on the basis that the money borrowed for Dams Nos. 2 and 3 will cost the Treasury 4 per cent (2 per cent payable semiannually).

3. In order that the committee may make a check of the figures quoted below by referring them to the Treasury Department or any other department for verification, I desire to set down the following bases that were used by me in arriving at the total result, and these bases are taken from the formal contract proposed by Mr. Ford and from the cost of construction and carrying charges as estimated by the Chief of Engineers.

4. DAM NO. 2.

Basis (A). That Mr. Ford's 4 per cent interest payments specified in paragraph 3 of his contract for Dam No. 2 will apply to \$50,175,000 January 1, 1931. This \$50,175,000 is arrived at as follows:

Cost to date of Dam No. 2.....	\$17,000,000
Net accrued interest before full 4 per cent payments begin.....	8,175,000
Cost to complete Dam No. 2.....	25,000,000

Total.....	50,175,000
------------	------------

Above figures are Chief of Engineer's estimates.

Basis (B). That this 4 per cent interest (2 per cent payable semiannually) on \$50,175,000 will run until January 1, 2025.

Basis (C). That beginning January 1, 1932, Mr. Ford will pay annually into the Treasury of the United States, account Dam No. 2, \$1,000,000 (4 per cent annually on \$25,000,000).

5. Since the above bases for calculation, I have assumed that the \$50,175,000 principal as of January 1, 1931, and the interest thereon, thereafter com-

pounded at the rate of 4 per cent (semiannual payments of 2 per cent) would be credited by the \$1,000,000 annual payments made to the Government as and when they were made under the proposed contract. This method of crediting the payments direct to the account they are indebted to avoids the necessity of assuming that the Government would turn around and loan this money at 4 per cent.

6. The above four assumptions (A, B, C, and par. 5) make a total unpaid cost of Dam No. 2 at the end of the lease period, which is January 1, 1925, of \$1,076,800,000.

7. DAM NO. 3.

Basis (A). Mr. Ford's 4 per cent interest payment specified in paragraph 7 of his contract for Dam No. 3 will apply to \$33,000,000 January 1, 1931. This \$33,000,000 is arrived at as follows:

Cost to build Dam No. 3.....	\$25, 000, 000
Overflowed lands.....	2, 331, 000
Net accrued interest before full 4 per cent payments begin.....	5, 669, 000
Total	33, 000, 000

Above figures are Chief of Engineers' estimates.

Basis (B). That this 4 per cent interest (2 per cent payable semiannually) on \$33,000,000 will run until January 1, 1928.

Basis (C). That beginning January 1, 1932, Mr. Ford will pay annually into the Treasury of the United States, account Dam No. 3, \$1,000,000 (4 per cent annually on \$25,000,000).

8. Using the above bases for calculations, I have assumed that the \$33,000,000 principal as of January 1, 1931, and the interest thereon, thereafter compounded at the rate of 4 per cent (semiannual payments of 2 per cent), would be credited by the \$1,000,000 annual payments made to the Government as and when they were made under the proposed contract.

9. The above four assumptions (A, B, C, and par. 8) make a total unpaid cost of Dam No. 3 at the end of the lease period, which is January 1, 1928, of \$409,100,000.

10. The Treasury account against Dam No. 2 will show a deficit at the end of the lease period (see par. 6) of \$1,076,800,000. With reference to Dam No. 3, the deficit will be \$409,100,000, making a total Treasury deficit at the end of the lease period, after crediting all of Mr. Ford's payments as called for by paragraphs 3 and 7 (Mr. Ford's contract) of \$1,485,900,000.

11. During the lease period, as per paragraph 10 of Mr. Ford's contract, there is to be in operation two amortization funds, as follows:

For Dam No. 2.....	\$19, 868
For Dam No. 3.....	3, 505

both payments being paid every six months, beginning with specified dates. These two sums for the lease period, if invested at the rate of 4 per cent (2 per cent compounded semiannually) will return to the Treasury approximately \$50,000,000.

12. The net total deficit that the Federal Government must supply by general taxation because of the failure of Mr. Ford's payments to foot the cost to the Treasury becomes \$1,485,900,000 (par. 10) minus \$50,000,000 (par. 11), or a net deficit in the Treasury of \$1,435,900,000.

13. I believe that with the above data before you, you will be able to see—

(a) That the method of computing the cost to the Treasury is the correct and practical method, and tells accurately what the effect on the Treasury and the taxpayers in the United States will be.

(b) That you will find, if this question is investigated, the bases for calculation and the mathematics applied to the same are both correct.

14. This letter does not cancel the statement made before the committee that the deficit would be \$1,275,000,000, which amount is correct for annual interest applied to the \$83,175,000 principal. The figures herein submitted are based upon semiannual interest payment on the same \$83,175,000.

Very truly, yours,

HUGH L. COOPER.

The CHAIRMAN. The chairman this morning received a number of telegrams from the mayors of Chattanooga, Nashville, Knoxville, and Memphis. They had read in the newspapers that there was a possibility of this committee going down to Muscle Shoals, so they have extended a very cordial invitation to the members of the committee to spend a day or two with everyone of them.

STATEMENT OF HON. S. HUBERT DENT, JR., ATTORNEY FOR THE ALABAMA POWER CO.

The CHAIRMAN. Gentlemen, Mr. Dent, former chairman of this committee, is present, and I understand he is here to represent the Alabama Power Co. in this matter.

Mr. DENT. Mr. Chairman, I represent the Alabama Power Co. as an attorney with reference simply to their legal rights in connection with this proposition. I do not represent the Alabama Power Co. or anybody else with reference to any policy that the committee may see fit to adopt. Mr. Thomas W. Martin, the president of the Alabama Power Co., is here and desires first to present the facts relative to the legal rights and other aspects of the Alabama Power Co.'s attitude in respect to Muscle Shoals this morning before we present the legal argument in the matter, and I would like for Mr. Martin to be heard with reference to the facts first.

The CHAIRMAN. As I understand it, the Acting Judge Advocate General made some recommendations regarding the legality of any agreement that the Alabama Power Co. has with the United States Government regarding the rights of the Alabama Power Co. in this plant.

Mr. DENT. Which is known as the Gorgas plant, near the Warrior River.

The CHAIRMAN. Yes.

Mr. DENT. Which is some 88 miles south of Muscle Shoals.

The CHAIRMAN. That is our understanding, and we would like to go into that.

Mr. DENT. I would like to go into that with you. I do not know what the program of the committee is. Since I was here about two weeks ago, the Alabama Power Co. has put in a bid for Muscle Shoals.

The CHAIRMAN. Yes.

Mr. DENT. I do not know what the disposition of the committee is as to hearing the power company on that proposition now or whether they would rather finish the hearing on the Ford proposition with reference to the rights of the Alabama Power Co. under that proposition.

The CHAIRMAN. We would prefer that you take up, first, the Ford proposition.

Mr. DENT. Then I will ask that Mr. Thomas W. Martin, the president of the Alabama Power Co., be heard with reference to the facts.

Mr. MILLER. Mr. Chairman, as I understand it, we are to hear now the Alabama Power Co. side of their contention regarding the Ford proposition?

The CHAIRMAN. Yes.

Mr. MILLER. And not their own proposition?

The CHAIRMAN. No; I thought it best to take up the Ford proposition first, and then they will take up their own proposition.

Mr. MILLER. I agree perfectly with the chairman.

STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO., BIRMINGHAM, ALA.

The CHAIRMAN. Mr. Martin, we will be very glad to hear what you have to say regarding this matter and you may proceed, for the present at least, in your own way and explain to the committee what your position is regarding the matter that was referred to by the Acting Judge Advocate General in his letter to the Secretary of War regarding the rights of your company. I will ask you first to state your name and the position you occupy.

Mr. MARTIN. My name is Thomas W. Martin; I live in Birmingham, Ala. I am president of the Alabama Power Co. I have been president of the company since February, 1920, succeeding Mr. James Mitchell, who had been stricken with paralysis and who died in 1920. Prior to that time I was vice president and general counsel of the company, and had been connected with the company as its counsel since 1912.

Mr. James Mitchell was the active executive of the company during its entire active history and until he was stricken with paralysis in 1920.

Some of the transactions of which I will speak were conducted by Mr. Mitchell. I knew of some of them from participation in them, and possibly to some extent, or to a larger extent, possibly, from contact with him; and in the affairs of our company I have been a director of the company since its active work began in 1912.

It is a rather difficult problem to know just where to confine myself in this discussion, and I hope, Mr. Chairman, if you think I am going beyond the strict limits of the question which you wish me to present, you will call my attention to it. I will try to confine myself to those limits. Necessarily, there are some incidents or statements which for the moment may seem as collateral or indirect, but which I believe are necessary to be presented to this committee.

The CHAIRMAN. Of course, the statement made by the Acting Judge Advocate General regarding this matter refers to the law of 1916, the national defense act, in a measure; and that act provided that the Government alone should erect this plant and should conduct it without any interference from any private corporation. You are familiar with that act, of course.

Mr. MARTIN. Yes; quite familiar, Mr. Chairman. The Alabama Power Co. was organized under the laws of Alabama in 1906 by citizens of that State. That company remained a nonoperating company for six years. Meanwhile, on March 4, 1907, the stockholders interested in it, citizens of that State, obtained an act of Congress approved March 4, 1907, to authorize the construction of a dam at the site selected for Lock No. 12 on the Coosa River. That was one of the sites which had been selected prior thereto by the engineers of the United States at which a dam should be built in a scheme of navigation improvement on that river.

Those gentlemen who were interested in the company, having obtained that act of Congress, undertook to find some one to take over the company and develop the property. There were others interested in Alabama in undeveloped water power projects, some connected with this same Alabama Power Co. group, others not connected with it. I shall not go into the relationships of those companies, because possibly that belongs to another branch of this investigation.

Mr. James Mitchell came into the situation in 1912; was invited into it by those people interested in the Alabama Power Co. and other companies. He formed a plan and took over this company with others, with a view to the developing of one or more hydroelectric stations.

This plan or these various properties, I might say, had been presented time and again to bankers and business men throughout this country and abroad for many years without any success. Mr. Mitchell was an engineer, an American citizen, who had never been in our State prior to 1911, and came there to look the situation over, and became interested in it, and undertook to find capital for the development of one or more properties.

A plan was formed to develop this Lock No. 12 property. The initial plan was to finance this property with English capital, and the program worked out pretty much as it was outlined in the beginning. Millions of dollars of capital were found abroad principally for this development.

The work of constructing the Lock 12 dam, and powerhouse was proceeded with and completed in the early part of 1914, but without a sufficient transmission system to market the power; and when the war began in Europe. In August, 1914, the company found itself with large indebtedness, with its securities held abroad in the ratio of possibly 65 or 70 per cent of all its securities held abroad. It was necessary to make an entirely new program. The company needed three times as much capital as it then had for transmission lines, stations, and for other purposes to market the power. As you gentlemen may know, it takes a great deal of money, after the power is developed, to bring it to market.

A new plan was formed. The English situation, represented by large investments, was subordinated to an entirely new financing program, and an arrangement was made in this country for further financing. It was carried through after long negotiations with the English bondholders and stockholders.

The new arrangement was arranged in the latter part of 1914 and the early part of 1915, since which time the company has been entirely financed in America to the extent of some \$28,000,000; and in addition to that financing, as you gentlemen know who have investigated these questions, large volumes of securities in American enterprises have, as a result of the war and con-

ditions abroad, come to this country. The conditions of exchange and what not have caused that liquidation abroad of American securities, and so it has been with our enterprise, and to-day we find ourselves with almost a complete reversal of the conditions which prevailed in 1914; that is to say, we have approximately 35 or 40 per cent of our securities held abroad, the balance in America.

This Gorgas situation came about in this way: It was necessary to have a steam reserve plant to enable a company such as this to sell power. We could not develop further waterpowers because Congress had not passed the legislation, as you gentlemen know. None was passed from 1912 to 1920. We built the reserve steam plant at Gadsden and we then found it necessary to build a second reserve steam plant. In investigating the question of its location, spending months of time, we finally selected a site on the Warrior River, northwest of Birmingham about 30 miles, an undeveloped point at the confluence of Bakers Creek and the Warrior River. The nearest settlement was some 8 miles. The advantages were, coal mine at the point, water for condensing purposes—

The CHAIRMAN (interposing). What do you mean by "at the point?"

Mr. MARTIN. At the location of the plant. Water for condensing purposes, close proximity to Birmingham, and hence to our load centers.

We arranged then to purchase land at this location. It was difficult to do so. We were only able to purchase approximately 20 acres of land in fee simple on which to erect a station. We purchased other surface lands immediately surrounding and also an interest in a coal mine or land then undeveloped containing coal, with a view to its gradual development to enable us to generate and bring into our system steam power from time to time in such volume as necessary to supplement our water-power system.

Of course, it was necessary not only to locate this site but we had to build roads, clear it away, because it was in a state of nature. We had to develop it from the ground up, and in addition to that, to build transmission lines and other stations bringing the power to our main system at Birmingham. This was in the early part of 1916, as I recall, or some time in 1916.

We arranged the financing and the construction program to build this reserve station, and to build a series of lines carrying the power to Birmingham. There arose, incidentally, demands for power in this district from coal mines, from municipalities and gradually, as a part of the same program, we extended the lines from this station.

I have handed you gentlemen a map which shows this situation. At this station the land was purchased and the property was constructed by the Alabama Power Co., and the lines which run northwest from Bessemer were constructed in part during the period ending, we will say, January 1, 1918, when the question arises which is before this committee.

I would like to show the committee a large picture of this Warrior plant as it was constructed with its immediate buildings and surroundings on the 1st day of January, 1918, which our company owned then, before any work was done or even seriously contemplated by the United States Government. This [indicating] is a picture of the plant taken February 7, 1918.

Meanwhile, there were definite negotiations with the Government for the extension of this plant which led to this contract, but there was no work done in connection with the Government which appears in any way upon this picture. This picture represents the plant as completed at that time. Of course, it does not show the lines and stations and service which radiates from it, either back to Birmingham or otherwise.

Mr. DENT. It represents the plant as constructed by your company originally.

Mr. FIELDS. Just what part of the picture represents the plant?

Mr. MARTIN. Everything you see in this picture, Mr. Fields.

The CHAIRMAN. That was on February 7, 1918?

Mr. MARTIN. Yes; this picture was taken on February 7, 1918.

The CHAIRMAN. We were already in the war at that time.

Mr. MARTIN. Yes, sir; and we were arranging a plan with the Ordnance officers for the extension of this plant.

This [indicating] is a picture of the conditions one year before, when there was nothing there and all this site was in a state of nature, and this photograph [indicating] was taken one year later, and this is the plant that was constructed by the Alabama Power Co. as I have explained.

Now, so that you may get the relationships in your mind, this is a picture of the plant taken still one year later, showing the plant as extended under the arrangement made with the United States.

The CHAIRMAN. And that was taken in 1919?

Mr. MARTIN. Yes, sir; this picture was taken on January 14, 1919.

Now, why did this situation arise or why was this arrangement made with the United States?

You gentlemen may know that when it was determined to construct nitrate plants at Muscle Shoals, the idea was to use water power. There was no water power developed at Muscle Shoals. It was necessary to provide some other source of power temporarily pending the construction of the water power plant.

This steam plant of our company to which I am referring was located 88 or 90 miles away. We were approached, first, by Mr. Frank S. Washburn, who was interested in the cyanamid process. He asked us to take up with the officers of the Government, which we did——

The CHAIRMAN (interposing). Will you allow me to ask you just one question there. Is this the Mr. Washburn who was a stockholder in the cyanamid company?

Mr. MARTIN. That is the Mr. Washburn, Mr. Chairman.

The CHAIRMAN. He was also a stockholder in the Alabama Power Co.?

Mr. MARTIN. He was. He is not now.

The CHAIRMAN. But at the time when he asked you to negotiate with the United States officers, he was a member or interested in the Alabama Power Co.?

Mr. MARTIN. He was a stockholder. He was not otherwise connected with us. He was not a director or officer in our company. He had resigned from our board at that time. Mr. James Mitchell took the matter up with the officers of the Ordnance Department.

The CHAIRMAN. Do you know what officer of the Ordnance Department had spoken to Mr. Washburn and suggested that you get in communication with the Ordnance Bureau?

Mr. MARTIN. I have understood that Gen. Crozier was the officer.

The CHAIRMAN. Gen. Crozier at that time was the head of the Ordnance Bureau of the Government?

Mr. MARTIN. Yes, sir; he was Chief of Ordnance at that time. Mr. Mitchell came to Washington, and if I am correct, Mr. Washburn did not further have any connection with any of the negotiations in this matter. The entire discussions were between officers or employees of the power company and the direct representatives of the Government.

Mr. Mitchell came to Washington and discussed the matter with, possibly, Gen. Crozier, and I am sure he discussed it with Col. Joyes, who was the chief of the nitrates division. Those discussions lasted for some days with a view to finding some way of working out the program by which the Government could obtain power from our company for the temporary operation of nitrate plants. It was the idea at that time that the Government would construct a nitrate plant at Sheffield, and that within six months, approximately, the first unit or section of that plant would be completed, which would require some 30,000 kilowatts of power.

Time was of the essence of the arrangement. Our company had on its system a large load. Its capacity was taken up or its minimum capacity, at least, was taken up for a large part of the year with service to municipalities and similar service of that character, but principally by industrial uses. We had a large part of the power in the service of such companies as the Tennessee Coal, Iron & Railway Co., other mining companies, and other industrial companies which were essential, either directly or indirectly, to the prosecution of the war activities. Possibly 80 per cent of the power of our company was in industrial use.

The question was: What could we do? We explained the situation to Col. Joyes. We explained our position with regard to customers. This reserve plant was necessary to enable us to render complete service throughout the year. Of course, the Government had a right to take such power as it cared to take from our system, under the conditions which existed. It was a question of balancing up as to what should be done, whether to take the power from one use or allow it to remain in another use.

It was agreed, first of all, that we were in position to supply some power for part of the year for this purpose. The arrangement, before anything else was agreed upon, was that these officers said to us, "We will at least construct a transmission line connecting with your station and take from you such power as emergencies may require." We were asked whether we would agree to construct the line. We agreed to construct the line and to provide the right of

way, which we agreed to. We owned in fee simple a part of the right of way at that time, and we agreed to immediately purchase the balance of it and place it at the disposal of the Government.

We gave orders by telegraph to proceed with the laying out of a transmission line for the account of the Government. How it was to be paid for and under what conditions, no one knew. We just went to work completing the right of way. We appropriated our own money and went ahead to get the right of way and we got the right of way.

In due course a plan was worked out by which material would be obtained and this line constructed to Sheffield. Coincidentally, or rather a little later in the negotiations, came this program for the construction of the Warrior extension because, obviously, we could not, without discontinuing service to others, supply 30,000 kilowatts of power to the Government, and the Government officials concluded that it was of public interest for us to maintain service to many of these large users of power. So there was nothing to do except to work out some arrangement by which a source of power could be created which would meet the emergency.

This plant, of course, the Government might have taken. It was under our general mortgage. We had made provisions in this plant for its enlargement. We had erected foundations and underwater structures, water intakes, planning the station for three units, as commercial conditions might require. They were important, very important, because the very work we had done, the very conditions which existed, meant at least six months of saving in time, in creating a supply of 30,000 kilowatts of power if it could be done by an extension of this station.

A great deal of the work at that time in formulating the plan and in its execution was carried on by Maj. R. D. Coombs, who was an engineer officer, who came into the service of the Government during this emergency, and was, as I understood, placed in charge of working out the details of this matter under Col. Joyes, and afterwards working out and supervising the entire construction program.

The CHAIRMAN. He was an emergency officer?

Mr. MARTIN. Yes, sir. He was an engineer officer, as I understand, who went into the service in the fall of 1917.

In this situation, our company having this land and having a plant, the question was what to do. It was explained and understood clearly by representatives of the Government and our company at that time that there was no law under which the United States could agree to sell that property, if created on our land, to the Alabama Power Co. That was understood and we recognized that to be the law, but what to do to protect the United States was the question. We had no legal power to sell a part of our plant station. It was a question which reached into our fundamental situation. Then the question was: What will we do, or what could we do, to protect the United States?

These gentlemen asked us: "If an arrangement is worked out by which an extension of your station is created and equipment placed there, will you agree to purchase at the conclusion of the emergency on the basis of fair value to the United States?" We agreed to do so. So that these gentlemen concluded that the Government would be protected in the situation, if we would agree, on the demand of the Government, to purchase the property at fair value and not at junk value. We agreed to it.

We agreed to purchase the property, and so the negotiations proceeded upon that theory, and that was our arrangement, the United States agreeing, or it being the plan to provide in the contract, that the United States would, if permitted by law, sell to us on our demand.

Thus the matter continued in this status. The Ordnance Department decided to proceed with the enlargement of this station, arranging with our company to undertake the work.

The contract is dated the 1st day of December, 1917; but, obviously, it was not executed then. It was executed long afterwards, as I will tell you.

Negotiations proceeded, Maj. Coombs conducting them in Alabama, Col. Joyes, and through his organization here. The lawyer in charge in behalf of the Government at Washington was Capt. Raymond Hull Noble, a lawyer who had entered the service and had been living in New York City, but who died in 1918.

The CHAIRMAN. Pardon me just a moment; the Army officer you refer to, Col. Joyes; was he a Regular Army officer or an emergency officer?

Mr. MARTIN. He is a regular officer of the Army.

The CHAIRMAN. He was a regular officer in the Army?

Mr. MARTIN. Yes; and is still in the service. He was chief of the division, and these gentlemen whose names I have mentioned, I understand, were in his department.

Capt. Noble was the law officer at first. He died later in the year, but before we had reached any agreement as to the details of the contract there were passed several acts of Congress which I want to call to your attention, because it was in the light of these acts of Congress that the form of the contract became different. In recognition of these acts of Congress Capt. Noble and myself, and we were interested, he on the side of the Government and I on behalf of the power company, principally, in working out the legal situation.

On May 10, 1918, an act was approved providing as follows:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That during the existing emergency the President be, and he hereby is, authorized, in his discretion and upon such terms as he shall deem expedient, through the head of any executive department, to sell any supplies, materials, equipment, or other property heretofore or hereafter purchased, acquired, or manufactured by the United States in connection with, or incidental to the prosecution of the war, to any person, partnership, association, or corporation, or to any foreign State or Government engaged in war against any Government with which the United States is at war; and any moneys received by the United States as the proceeds of any such sale shall be covered into the Treasury of the United States and a full report of the same shall be forthwith submitted to Congress."

A further act was passed on this same subject approved July 9, 1918.

The CHAIRMAN. Do you know what that act was known as?

Mr. MARTIN. I do not, Mr. Chairman.

The CHAIRMAN. Did it have the name of the author attached to it?

Mr. MARTIN. I have not heard that it did.

Mr. DENT. I think, Mr. Chairman, although I am not sure, that it was a legislative provision attached to some appropriation bill. That is my recollection of the facts.

The CHAIRMAN. Well, that was done on a number of occasions during the war.

Mr. MARTIN. This appears to be an independent act.

Mr. DENT. I am not sure about that.

Mr. MARTIN. On July 9, 1918, an act was approved, and possibly this may have appeared in an appropriation bill:

*"Sale of war supplies: That the President be, and he hereby is, authorized, through the head of any executive department, to sell, upon such terms as the head of such department shall deem expedient, to any person, partnership, association, corporation, or any other department of the Government, or to any foreign State or Government engaged in war against any Government with which the United States is at war, any war supplies, material, and equipment, and any by-products thereof, and any building, plant, or factory, acquired since April 6, 1917, including the lands upon which the plant or factory may be situated, for the production of such war supplies, materials, and equipment which, during the present emergency, may have or may hereafter be purchased, acquired, or manufactured by the United States: Provided further, That sales of guns and ammunition made under the authority contained in this or any other act shall be limited to sales to other departments of the Government and to foreign States or Governments engaged in war against any Government with which the United States is at war and to members of the National Rifle Association and of other recognized associations organized in the United States for the encouragement of small-arms target practice: Provided further, That a detailed report shall be made to Congress on the first day of each regular session of the sales of any war supplies, material, lands, factories, or buildings, and equipment made under the authority contained in this or any other act, except sales made to any foreign State or Government engaged in war against any Government with which the United States is at war, showing the character of the articles sold, to whom sold, the price received therefor, and the purpose for which sold: Provided, That any moneys received by the United States as the proceeds of any such sale shall be deposited to the credit of that appropriation out of which was paid the cost to the Government of the property thus sold, and the same shall immediately become available for the purposes named in the original appropriation: * * **

The CHAIRMAN. How does that law affect the Alabama Power Co.?

Mr. MARTIN. For this reason, Mr. Chairman: This law came into the situation in this way. This law gave the authority from Congress to the executive

branch of the Government to sell this character of property, and Capt. Noble and those gentlemen in the nitrates division construed it to give authority for them to agree in behalf of the United States that the United States would sell this property to the Alabama Power Co. upon its request, the power company also agreeing to buy it on the request of the United States Government. It removed the uncertainty which up to that time had existed, namely, as to whether the Congress has conferred the power on executive officers to sell such property as this.

The CHAIRMAN. Let me ask you this question: Your company, the Alabama Power Co., insisted on the passage of that law before they were willing to negotiate?

Mr. MARTIN. No, sir; we never knew the law was passed until it was passed. We were constructing and this whole arrangement was in effect, and we had agreed to purchase on the demand of the United States. We had nothing to do with the passage of the act?

The CHAIRMAN. You did not know about the passage of the act. I understand you to say?

Mr. MARTIN. When the contract was signed, of course, we knew the law was in existence.

The CHAIRMAN. Have you thought what might have happened had you refused to do anything for the Government in accordance with the original law, the United States being at war at that time?

Mr. MARTIN. We did not refuse, Mr. Chairman, of course. We were going right ahead and doing whatever the gentlemen asked us to do. They asked us to do certain things, and we agreed to do them.

The CHAIRMAN. Did your officers have meetings at that time frequently, and your board of directors?

Mr. MARTIN. Yes; of course we had meetings, Mr. Chairman.

The CHAIRMAN. Anybody that refused to carry out the requests of the Government was in danger of being designated a pro-German, was he not?

Mr. MARTIN. Absolutely; and we carried out every request that was made of us, Mr. Chairman.

The CHAIRMAN. Did that fear have anything to do with your offers?

Mr. MARTIN. We were willing to do whatever we could, of course, and wanted to do whatever we could to aid the Government at the time. The emergency was of such a character that we all, as patriotic American citizens, wanted to do our duty, and we felt then and feel now that we did our duty. The question of the disposal of this property was a secondary consideration, Mr. Chairman.

The CHAIRMAN. Just continue your statement, Mr. Martin.

Mr. MARTIN. The Government officials felt it was fair to require us to purchase on the demand of the Government, and we agreed to it without any hesitation.

Mr. FIELDS. Mr. Chairman, did Mr. Martin give the date of each one of those acts?

The CHAIRMAN. I think he stated the dates, but in order to make doubly sure I will ask him again. What was the date of the acts you refer to?

Mr. DENT. May 10, 1918, was the first one, and July 9, 1918, the last one.

Mr. PARKER. As to the last act, I wish you would read over the words about war equipment and supplies and so on. I did not get that exactly.

The CHAIRMAN. Will you kindly read that again, Mr. Martin?

Mr. MARTIN. "That the President be, and he hereby is, authorized—

Mr. PARKER. I do not refer to that part, but the part with reference to selling certain classes of property.

Mr. MARTIN. "Any war supplies, material, and equipment, and any by-products thereof, and any building, plant, or factory acquired since April 6, 1917."

Mr. PARKER. And then it goes on and refers to manufactured products.

Mr. MARTIN. "For the production of such war supplies, materials, and equipment which, during the present emergency, may have been, or may hereafter be, purchased, acquired, or manufactured by the United States."

Now, prior to this time, Mr. Chairman, and before these acts were passed, we had constructed this transmission line from our system to Sheffield, in the remarkably short time of five months, and the line was in operation before there was any additional power supply at Warrior. I do not know whether you understood me exactly. I was just saying that before any of these acts were passed the transmission line was constructed in five months and was in operation in the early part of May, and the Government was in position to obtain all the power it needed before any of these acts were passed.

The CHAIRMAN. Let me ask you these questions in order that I may get the matter perfectly clear in my own mind: You made this first agreement with the Government, as I recall, in December, 1917?

Mr. MARTIN. It was more verbal than otherwise. There was no contract.

The CHAIRMAN. It was enough of a contract to put your people at work?

Mr. MARTIN. Yes, sir; it was.

The CHAIRMAN. And that was in December, 1917, during the first year of the war?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Now, this last act, which you said was passed on July 9, 1918—

Mr. MARTIN. Yes, sir; that is correct.

The CHAIRMAN. Did you finally sign another agreement in 1918?

Mr. MARTIN. We did, Mr. Chairman; not another agreement, Mr. Chairman. We signed a single agreement covering the whole subject on the day of the false report of the armistice, in November, 1918. It was signed by both parties on that day at the city of New York, in the office of the Alabama Power Co., where the meeting was held to close the arrangements.

I have here a certified copy of the minutes of the board of directors of our company held on November 4, 1918, approving of the contract and authorizing it to be executed.

The CHAIRMAN. At that time this last law which you read had been passed by Congress and signed by the President.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. And the new arrangement which you agreed to and which I assume was signed by the respective parties carried in it this new law.

Mr. MARTIN. Yes; there was no—

The CHAIRMAN (interposing). I believe, on the first day of the hearing, we put into the record the full contract that you entered into with the Government.

Mr. MARTIN. Yes; sir; there was not but one contract, Mr. Chairman, and that one is dated December 1, 1917, and was executed on November 9, 1918. It is known as contract T-69. In the meantime, the work had been largely completed.

The CHAIRMAN. Have you ever put into the record or have we in the record the original contract that you entered into?

Mr. MARTIN. There was no other contract we entered into.

The CHAIRMAN. I mean the original agreement of December 1, 1917.

Mr. MARTIN. It was merely a letter, Mr. Chairman, directing us to proceed.

The CHAIRMAN. Did it go into details?

Mr. MARTIN. No, sir.

The CHAIRMAN. Could you put that letter into the record?

Mr. MARTIN. I will be very glad to.

The CHAIRMAN. We will be very glad to have it.

Mr. MARTIN. We were directed to proceed with the construction of the transmission line and to make plans for the extension of this station, the terms and conditions, including compensation, to be thereafter agreed upon.

Mr. DENT. Mr. Chairman, I think that is a very important point you are bringing out, and when you get through, will you allow me to ask Mr. Martin some questions right along that line, right here, because I think it is quite important, if you are through with your questions?

The CHAIRMAN. Go ahead.

Mr. DENT. Mr. Martin, is it not a fact that from December 1, 1917, up to date of the execution of the contract on November 9, 1918, you were acting under verbal instructions of the War Department and you had no written contract at all with the Government?

Mr. MARTIN. We had no written contract. We were merely acting under letters directing us to proceed.

Mr. DENT. And verbal directions.

Mr. MARTIN. Supplemented by verbal directions from time to time.

Mr. DENT. And the only contract that was executed between the Government and your company was the contract that was dated December 1, 1917, but actually executed November 9, 1918?

Mr. MARTIN. That is correct, Mr. Chairman.

After Capt. Noble died, Mr. Chairman, the work on the legal side of the contract was taken up by Lieut. Col. William Williams, a lawyer then in the service, who had been practising law in New York City. I did not know him and none of us knew him prior to the time he took up this subject.

The CHAIRMAN. He was an emergency officer, as I recall.

Mr. MARTIN. Yes, sir; he was a lawyer, and I remember something about him because he told me he had been practicing law in New York since 1894, and was then practicing law in New York City. He conducted the legal negotiations to a conclusion.

The CHAIRMAN. Do you know with what firm he was connected before he came into the Army?

Mr. MARTIN. I do not know, Mr. Chairman. I visited his office a few days ago when this controversy came up. I had not seen him since the execution of the contract. I called him on the phone in New York and asked him his recollection of the time of the execution of the contract.

The CHAIRMAN. Yes.

Mr. MARTIN. He explained he could not discuss it with me because he was leaving in 30 minutes to take a steamer for Japan. However, he did agree for me to come around and spend a few minutes with him. I went to his office with another director of the company.

The CHAIRMAN. Where was his office at that time?

Mr. MARTIN. It was either 15 or 25 Broad Street. I went to his office and talked to him, and he recollected the details, as I did, in connection with the execution of the contract. He said to me he did not care to make any written statement at the moment, but he would be very glad to come before the committee if the committee cared to hear him. But he left that day, as he told me, on a trip of several months. That is all I know about the situation as far as Col. Williams is concerned. There was one other officer of the Government engaged with Col. Williams and Col. Joyes in working out the contract, and that was Col. C. F. Beames.

The CHAIRMAN. Was he an emergency officer?

Mr. MARTIN. Yes, sir; he was an emergency Engineer officer. He is not in the service now; he lives in New York.

The CHAIRMAN. Do you know where he lives in New York, or what his address is?

Mr. MARTIN. He is connected with a firm at No. 62 Cedar Street, the firm of A. B. Leach & Co.

The CHAIRMAN. Mr. Dent, do you desire to ask Mr. Martin any more questions?

Mr. DENT. No; that is all. I just wanted to bring out the fact that we only had one written contract.

The CHAIRMAN. If you will kindly continue, Mr. Martin, we will be glad to hear you.

Mr. MARTIN. I think it might be worth while to refer to a certain bulletin which followed the passage of these two acts of Congress and which was dated August 3, 1918, bearing upon the question of this character of a contract. This bulletin was issued by Gen. Goethals, Assistant Chief of Staff, and it says:

"Where increased manufacturing facilities are constructed at the expense of the Government or where their cost is amortized in the price paid by the Government the contract shall provide that title to such facilities shall vest in the United States. The contractor may agree to take such facilities at a fair value in diminution of the profit which he otherwise would make.

"Where title to increased manufacturing facilities vests in the United States, the contract shall provide that the contractor may make written offer to the Government to purchase such facilities, whereupon, if the Government accepts such offer, the contractor shall become obligated to pay for such facilities at their appraised value at that time. The contract shall further provide that if the contractor does not make or the Government does not accept such offer the Government shall have the right to remove such facilities after the termination of the contract within a time reasonably sufficient to effect such removal. The contract may provide that the Government shall have an option at the termination of the contract to purchase at an appraised value the land on which such facilities are erected.

"If, in case of such increased manufacturing facilities, it is desired to make a contract along lines different from those herein established, the approval of the superior board of review shall first be secured.

"By authority of the Secretary of War:

"GEO. W. GOETHALS,

"Major General, Assistant Chief of Staff,
"Director of Purchase, Storage, and Traffic."

The CHAIRMAN. What was the date of that?

Mr. MARTIN. That was dated August 3, 1918. I merely mention that for such bearing as it may have on the situation.

Bearing in mind certain features of the contract, you may recall that the contract recites, in its opening, that, "Whereas the contractor owns and operates an electric generating and transmitting and distributing system in the State of Alabama, which includes in general (1) a hydroelectric plant on the Coosa River, with an installed capacity of 67,500 K. V. A.; (2) a transmission network (including a 110,000-volt system) connecting the aforesaid plant with various other plants and substations; (3) a steam-reserve generating plant, hereinafter referred to as the Warrior station, situated on the Black Warrior River at the junction of said river with Bakers Creek, Walker County, and having an installed capacity of 25,000 K. V. A.; (4) certain rights of way extending approximately 20 miles from said Warrior station toward Sheffield, Ala., and available for the consumption thereon of a portion of the transmission line hereinafter referred to; and

"Whereas the contractor represents that it now owns and controls at said Warrior station things and facilities which will be useful in connection with the installation, construction, and operation of the Warrior extension and Warrior substation hereinafter referred to, including (a) adequate circulating water intake and discharge facilities, with gates, screens, canals, and tunnels; (b) partially constructed building and apparatus foundations; (c) camps, roads, tracks, and docks; (d) plans and specifications; (e) a staff for engineering, construction, and operation; (f) ash-handling facilities and ash-dumping spaces; and (g) other facilities in existence at or about said station at the commencement of work under this contract which will be useful in the maintenance and operation of said Warrior extension as a point for the generation of electric energy."

That was recited in substance as the situation that existed at this station. And the contract provided then, first, that we should erect additional tie lines between this Warrior station and our system with a view that the Government should be able at all times not only to take the capacity of this extension and this Warrior station, but that it should be able to take 30,000 additional kilowatts out of our main system. We undertook to construct this additional tie line, which we did at a cost of some \$300,000. That was our own money and the Government had nothing to do with it. That was one of the obligations we undertook.

Then it was provided that we should construct an extension of this station on our own lands according to Government specifications, and to this transmission line on our own right of way.

The CHAIRMAN. With whom did you agree to do that, or with what officer?

Mr. MARTIN. This was the contract with the United States, and Col. William Williams executed it in behalf of the United States.

Then there was a provision, quite important, that upon the construction of the property we would undertake to operate and maintain the extension as a part of our system and supply from our system at least 30,000 kilowatts of power; not only maintain the property at our own expense but keep it in first-class order and then insure it in behalf of the United States, which we have performed all the while. We also agreed in that contract that the United States should from that time forward have a superior right to take power from our system over any other contract which we might thereafter make, so long as this contract was in existence—that is, any additional power.

There are various features of the contract which all go to show that the Government undertook to take such amount of power as it might need or desire from our system, and we undertook from our system, supplemented by the Warrior extension, to supply the power. It was never throughout any of the negotiations suggested that section 124 of the national defense act had anything to do with this question. Nothing was ever discussed in reference to section 124 of the national defense act. From first to last it proceeded as an arrangement by which we would supplement our facilities to enable us to supply power to the Government, and to protect the Government in that situation, that we were to agree to purchase the property at a fair value, not a junk value—and the property to-day has a fair value. Of course, it has a fair value, and when the time comes and the Government wants us to purchase the property we stand ready and willing and able to purchase at its fair value, in pursuance of the terms of this contract. We have never said we would purchase it

at a junk value and are not saying so to-day. It would be unfair for us to do so.

Now, this station, gentlemen, erected as it is, forms an integral part of our system. We have a coal mine there serving this plant. We have ash-dumping space, we have all those facilities common to one plant. We also have a single water intake.

It has been mentioned here that there is a large plant known as the Windsor plant in Ohio, where there are two distinct ownerships, and that was cited as evidence that such a plant as this can be divided in ownership. But I know the Windsor situation. There are two ownerships there, but there is a contract between both of those companies. They have organized an operating company, a single operating company to operate that entire station as one, delivering to each company such amounts of power as their respective needs may require. That is an arrangement which could not be worked out except through a single operation, each contributing in proportion to the power it takes and to the operating expense of the station. But our situation is such that there can not be two operating stations. The Government officials tried it out during the war, but I am sure they do not think it can be done now, that is, those gentlemen who know the facts.

When it came to this question of the national defense act Secretary Baker made the statement before the Graham committee that nitrate plant No. 2 was not built under the national defense act. It also appeared in that investigation that the Warrior extension was not built under that act. We have in the record a copy of President Wilson's directions, dated February 23, 1918, authorizing \$13,385,000 of the fund appropriated by section 124 to be used on what is now the Wilson Dam and powerhouse. Maj. Burns has testified that the balance of that fund had previously been spent on other projects, or is now in hand. Gen. Williams testified that nitrate plant No. 2 was erected from the appropriations for fortifications, and also that the extension at the Gorgas plant was erected from that source, and not one cent of the \$20,000,000 appropriated under the national defense act was spent on the Gorgas plant or the transmission line. These two elements represented a large sum, \$67,000,000, many times in excess of the \$20,000,000 appropriation. Of course, the plants provided for under this act were not the plants provided for here, because the President did not designate Gorgas in his letter at any time; there was no reference to it at all. When the President discharged the duties imposed upon him by that act he selected property other than the Warrior extension, and never said the plant selected by him under that act should be treated as the nitrate property.

On that basis of the case, considering its entire history, we feel that we have all along complied with every request, verbal or written, of the Government. We have stood ready at all times to place our entire system at the disposal of the Government. We have made a contract in good faith with Government officials and we stand ready to carry it out.

The CHAIRMAN. Is that as far as you care to go at the present time, Mr. Martin?

Mr. MARTIN. I would be glad to answer any questions you wish to ask me.

Something was said about our own investment in connection with this extension. If the committee would care to know about that I would be glad to tell you what we spent in connection with this matter.

Our investment and expenses amounted to \$1,016,515.61 in connection with the station. I shall be glad to read the items in detail if you desire me to do so.

The CHAIRMAN. We will be glad to hear the statement. That is in connection with the Government's request regarding the transmission of power from the line at Gorgas to nitrate plant No. 2?

Mr. MARTIN. Yes; and those investments and expenses related to the Gorgas project. We had a number of obligations which we took on in connection with it from time to time.

The CHAIRMAN. Will you kindly read the statement you refer to?

Mr. MARTIN. We agreed in article 1 of the contract to construct what is known as a tie line with a certain capacity, and which also involved the duty of constructing a substation of sufficient capacity at Bessemer to enable the power to be passed from our system into this line. Those transmission lines from Warrior to Bessemer and additional substation facilities at the Bessemer substation, inclusive of additional rights of way purchased by the Muscle Shoals-Warrior transmission lines, cost us \$330,720. We agreed to stand part of the cost of constructing what is known as the Drifton Railroad. The Government

advanced \$30,000 toward that construction, and our company advanced \$103,-962.27 in addition to that.

Then we had certain expenses, consisting of engineering, excavation, and construction, chargeable to the second unit, placed or purchased for the second unit, which was occupied by the Government facilities, representing an investment on our part of \$212,627.50.

When this plant was created, or just before the plant was put into service, we purchased additional coal from many sources to operate this additional unit. As we had to place the coal in storage, the storage facilities were inadequate. This is not a very large item, but we had a fire which burned \$17,100 worth of coal, the fire being caused by spontaneous combustion. We were under an expense of \$17,222 for the cost of handling coal in storage made necessary by the cessation of Government activities and the lack of coal-handling facilities. Then there was additional labor cost at the Warrior plant due to the compulsory operation under the 8-hour law, and that amounted to \$12,799.75. We had a coal mine that we equipped to supply coal for the entire output of this station, and we increased the facilities from a capacity of 350 tons a day up to approximately 800 tons a day. The equipment we put in there represented an investment of \$224,736.79.

Then we had some expenses of this character: We had on order, for instance, when the Government came into the situation, a 20,000-kilowatt unit to occupy this second space in our power house. We canceled the order at the request of the Government, and we had certain losses with the manufacturers to meet for the turbine and for the condensers. We paid the General Electric Co. approximately \$10,000 to rewind the turbine to meet the needs of another purchaser. We had to take the condenser which we now have on the ground at a cost of \$42,744.86. Then we had some expense for completing the installation of the Government equipment at the Warrior plant after the Government had stopped all payments in connection with that work. Those items altogether make a total of \$1,016,515.61.

We do not claim anything for those things; we merely mention those to show our out-of-pocket and investment expenses in connection with this work. Of course, our system there represented at that time property values of approximately \$35,000,000, and that entire system with all this generating capacity and facilities were connected through this tie line and station with this Warrior plant. I am reminded by one of my associates that there were a supplemental contract to contract T-69, which I will place in the record, if the committee wishes, making certain changes in certain provisions. It was negotiated in 1919, which, in its recitals, in effect, reaffirmed this contract that is now before the committee. I will be glad to place same in the record.

(The contract referred to is as follows:)

THE UNITED STATES OF AMERICA AND THE ALABAMA POWER Co., BIRMINGHAM, ALA.—SUPPLEMENTARY CONTRACT T-69 A FOR COMPLETION OF CONSTRUCTION FEATURES RELATING TO ORIGINAL CONTRACT T-69. DATED AUGUST 1, 1919.

This contract made this 1st day of August, 1919, between the Alabama Power Co., a corporation organized and existing under the laws of the State of Alabama (hereinafter called the contractor) party of the first part, and the United States of America, by R. H. Hawkins, lieutenant colonel, Ordnance Department, United States Army, acting as contracting officer by authority of the Chief of Ordnance, United States Army, and under the direction of the Secretary of War, party of the second part, witnesseth:

(a) Whereas a certain contract was entered into between the United States and the contractor, No. T-69, dated December 1, 1917, a copy of which contract is hereto attached and made a part hereof, marked "Exhibit A" (hereinafter called "original contract") which term also includes, wherever used herein, all agreements or orders, if any, supplementary to said contract, except this agreement; and

(b) Whereas the original contract provided that the contractor should at the expense of the United States prepare and submit to the contracting officer general plans and specifications for approval and upon such approval, construct certain facilities for the benefit and account of the United States, generally known as the "Warrior Extension," "Warrior Substation," "Warrior-Muscle Shoals Transmission Line," "Muscle Shoals Substation," and an extension to the Ensley-Southern Branch of the Southern Railway, known as the "Drifton Extension Railroad," which facilities are described in greater detail in Schedules A, B, C, D, and E, which form part of the original contract No. T-69; and

(c) Whereas the United States did on April 15, 1919, direct the suspension of further construction work on account of the original contract, and as a result, the contractor has been unable to complete certain minor details of construction called for and shown on plans properly approved by the representative of the contracting officer, under the terms of that contract, the remaining details being essential to the satisfactory operation of the facilities provided by the United States but not of sufficient importance to warrant the expense for further maintenance by the United States of a staff of inspectors, clerical and other help to supervise their execution as was necessary in the public interest during the active construction period; and

(d) Whereas the contractor has a regularly organized staff of operating engineers, mechanics, and workmen established at its Warrior generating station, capable of carrying out the completion of such minor construction items as remain, and with a view toward economy and the satisfactory termination of the construction program, it is the desire of the United States and the contractor that the operating staff of the contractor, guided by the contractor's technical staff, carry out such work; and

(e) Whereas it is the desire of the United States and the contractor to maintain in full force and effect the conditions and covenants embodied in the original contract T-69, and to only modify the conditions of the said original contract in respect to the methods of executing the minor construction works and tests, covered by this supplementary contract and of making payment for such work.

Now, therefore, in consideration of the mutual agreements herein contained, the said parties have agreed, and by these presents do agree, with each other as follows:

ARTICLE I.

GENERAL.

The contractor shall, at its own expense, furnish all necessary engineering talent, drawings, skilled and common labor, likewise all materials and supplies not now available at the storehouse of the United States at Gorgas, and will complete the items listed in the following schedule of unfinished items of construction in a thoroughly workmanlike manner (and to the complete satisfaction of the contracting officer, or his duly authorized representative). The United States shall furnish without cost to the contractor such materials and supplies, purchased by the United States for use in connection with this contract and/or now in its storehouse at Gorgas, Ala., as may be necessary for the completion of the work scheduled and described in Article II hereof.

ARTICLE II.

SCHEDULE.

The following is a schedule of items of construction which the contractor, under the terms of this contract, agrees to carry out:

Power house (the following items required to complete):

1. Install Louvres at end of main monitors over conveyors (material on hand); labor-----	\$25
2. Provide stop logs for west entrance to ash pit (material on hand); labor-----	50
3. Double rivet each vertical seam of corrugated galvanized iron on temporary ends of boiler-house and turbine-room sections of building (rivets on hand); labor-----	100
4. Place flashing around 42 and 16 inch exhaust (material on hand); labor-----	10
5. Grout around pipe holes in floor of No. 3 boiler room; material, \$4; labor, \$36-----	40
6. Install floor drains in No. 3 boiler room; material, \$4; labor, \$16--	20
7. Install glass in door of 13,000-volt switch room (glass on hand); labor-----	10
8. Install locks on doors of monitors; material, \$5; common labor, \$5--	10
9. One additional coat of paint on boiler room No. 3, whitewash ash rooms; 2 coats of paint on condenser room; 2 coats of paint on all floors; all window sash to be drawn; material, \$1,000; labor, \$445-----	1, 445
10. Fit and bolt down manhole covers on air ducts (material on hand); labor-----	50

Smoke flues and stack:

11. Install check valves between flues and ash sump (material on hand); labor----- \$20
12. Furnish and place one cover for damper frame; material, \$5; labor, \$5----- 10

Coal-handling tracks:

13. Install standard-gauge track scales (scales and material for scales on hand); cement powder, etc., \$100; labor, \$1,400----- 1,500
14. Adjust cross-over dumps and resurface tracks; labor----- 200

Coal crushers and conveyors:

15. Provide side aprons for screens in crusher pits to prevent coal from sifting into pit (material on hand); labor----- 100
16. Put one coat of paint on conveyor sheds (material on hand); labor----- 300

Boilers:

17. Put plastic fire clay around superheaters on boilers Nos. 7, 8, and 9 (clay on hand); labor----- 150
18. Install plates on sides of all boilers between fronts and building columns (plates on hand); labor----- 150

Stokers:

19. Repair broken governor on No. 16 stoker; labor----- 10

Steam and exhaust lines:

20. Furnish and install one Davis automatic valve for No. 14 boiler; labor----- 20
21. Reinstall by-pass valve on 20-inch and 2 valves on 16-inch when valves are replaced by the Chapman Co.; labor----- 25
22. Connect steam and exhaust piping on No. 16 stoker (pipe on hand); labor----- 25
23. Repair stay bolts in big steam separator; labor----- 25
24. Connect steam and exhaust piping to fans in No. 3 ash pit; 2 4-inch steel ells, \$25; labor, \$25----- 50
25. Install steam and exhaust line drains in boiler rooms (8 4-inch check valves have been shipped); labor----- 50
26. Install cross-ties on 4 main steam lines over boilers (material on hand); labor----- 200

Feed-water lines:

27. Replace Ross expansion joints on No. 3 unit with pipe; labor----- 100
28. Furnish and install one 4-inch globe valve on boiler No. 15; valve, \$25; labor, \$25----- 50
29. Furnish and install 1 new handwheel on 4-inch globe valve on No. 13 boiler; handwheel, \$2; labor, \$3----- 5

Feed-water pumps.

30. Install new shaft in steam-driven pump in No. 2 unit when shaft supplied without cost to contractor by manufacturers; labor----- 50
31. Replace coupling pins in motor-driven pump in No. 3 boiler room; labor----- 5
32. Install new operating cylinders and adjust Copes regulators on the steam-driven pumps (cylinders being shipped); labor----- 25

Air compressor:

33. Install motor on foundation and bolt to compressor (motor on order); labor----- 50
34. Install air lines to turbine room and condenser pit; pipe, \$100; labor, \$50----- 150

Pipe covering:

35. Furnish and install additional pipe covering omitted from the Armstrong Cork & Insulating Co.'s contract----- 3,000
36. Turbine to be painted (paint on hand); labor----- 100
37. Furnish superintendence, labor, fuel, and miscellaneous supplies necessary for the final test of the 30,000-kilowatt General Electric steam-turbo generator and auxiliaries upon the reerection of the turbo-generator and auxiliaries by the General Electric Co. (lubricants on hand)----- 2,500

Boiler and turbine room instruments:

38. Pipe up boiler steam-flow meters on boilers 8, 9, 13, 14, 15, 16, 17, and 18; 2 on each boiler; pipe up draft gauges on boilers 8, 9, 13, 14, 15, 16, 17, and 18; pipe up steam gauges on instrument boards of boilers 9, 13, 14, 15, 16, 17, and 18; install, with piping complete, Venturi meters on individual boilers, except No. 12 boiler; pipe up recording pressure gauge for live steam to turbine; pipe up CO² recorders for No. 1 and No. 2 stacks; pipe up pressure gauges for feed-water pumps in No. 3 boiler room; pipe up Venturi meter recorder for boiler feed in No. 3 boiler room; erect and pipe up recording thermometer for heater inlet and outlet in No. 3 boiler room; erect and pipe up recording thermometer for live steam to turbine; furnish and install, with piping complete, the manometer tubes for boilers 7, 8, 9, 10, 11, 13, 14, 15, 16, 17, and 18; 10 manometer tubes, \$950; 3,000 feet of $\frac{1}{2}$ and $\frac{3}{4}$ inch pipe, \$500----- \$1, 450
39. Install signal system in boiler room and engine room, equipment on hand----- 400

Oil filters:

40. Install two small filters for oil from auxiliaries (filters on hand); pipe, \$500; labor, \$350----- 850

Sump pumps:

41. Install 2 sump pumps in condenser pit (on hand)----- }
 42. Install 1 sump pump in ash pit (on hand)----- } 450
 43. Install 2 sump pumps in coal crushers (on hand)----- }

Electrical installation:

44. Give 1 coat of paint to 110 K. V. switches (paint on hand); labor----- 25
45. Install choke coils on Sheffield line switch No. 1114 (coils on hand); labor----- 25
46. Install signal system for generator; material, \$250; labor, \$100----- 350
47. Replace single strain insulators on No. 3 bank, 110 K. V. transformers, by double strain insulators (material on hand); labor----- 50
48. Install corona shields on 110 K. V. air-brake switches (material on hand); labor----- 125
49. Install three cables to No. 3 bank, 110 K. V. transformers (cable on order); labor----- 50
50. Erect new bushings on spare transformers (one 110 K. V. bushing to be repaired, four 12 K. V. bushings on order); labor----- 50
51. Install sheet-iron covers on both exciter switch panels (material on hand); labor----- 25
52. Connect up air compressor motor (material on hand); labor----- 25
53. Connect up 5 sump pump motors (material on hand); labor----- 125
54. Wire turbine trip switch to gauge board; labor----- 10
55. Replace 3 current transformers and connect up potential transformers at the same time (transformers and material on hand); labor----- 25
56. Lay concrete floor in tunnel; material, \$25; labor, \$25----- 50
57. Complete drainage of 110 K. V. switchyard; labor----- 250
58. Fill oil tanks and return empty oil barrels; labor----- 25

20 semipermanent houses:

59. Build 500 feet of 6-inch sewer (pipe on hand); labor----- 100
60. Paint the outside of 4 houses (paint on hand); labor----- 80

12 permanent houses:

61. Complete the inside of painting of house No. 5----- 25
62. Complete the outside painting and do all of the inside painting on house No. 6 (paint on hand); labor----- 100
63. Lay floors in house No. 8; give 2 coats of paint inside, 1 coat of paint outside; erect hot-water tank (material on hand); labor----- 250
64. Screen all of the 12 permanent houses (material on hand); labor----- 200

Niles crane:

65. Repair niles crane, installing 2 new sheaves; sheaves ordered, \$10; labor, \$20----- 30
66. Repair automatic stop for crane; labor----- 25

Cleaning up:

67. Cleaning up property, dismantling temporary structures and buildings; collect and store all salvaged material at places at Gorgas satisfactory to the contracting officer or his authorized representative, making a complete list of all such materials; this does not include crating, dismantling, and packing machinery and equipment and does not include storing or moving salvaged materials after same have been placed or stored at said location once designated by contracting officer.----- \$1,500

Total amount.----- 17,300

ARTICLE III.

PAYMENT.

(a) For and in consideration of the contractor's acceptance of the accomplishment of the above 67 items, and upon receipt of a certificate from the contractor that the Alabama Power Co. accepts the above 67 items as accomplished, and the "Warrior Extension," "Warrior Substation," "Warrior-Muscle Shoals Transmission Line," and the "Muscle Shoals Substation" as complete and ready for use in the performance of contract T-69, the United States of America shall pay to the contractor the sum of \$17,300.

(b) In reference to item 37 of the schedule contained in Article II hereof, it is agreed that for the specified sum of \$2,500 the contractor will furnish superintendence, labor, fuel, lubricants, and miscellaneous supplies, necessary for the final test of the 30,000 kilowatt General Electric steam turbogenerator and auxiliaries, and will conduct such test; it being understood, however, that should conditions beyond the control of the Alabama Power Co. require that additional test or tests be made in connection with the 30,000 kilowatt steam turbogenerator included under item No. 37 above, and involving an expense in excess of the sum of \$2,500 as agreed upon for that item, the Alabama Power Co. will not be obliged to make same, but the contracting officer may request that same be done at the further expense of the United States.

(c) The contractor shall not be liable for accident or damages arising from or occurring during the test of the said 30,000 kilowatt steam turbogenerator and auxiliaries included under said item No. 37 of said schedule or for any modification of the same as they are set up in said original contract.

ARTICLE IV.

This contract is made in pursuance of a certain proposal made by the Alabama Power Co. to Col. J. W. Joyes, dated May 24, 1919, and an acceptance thereof by Col. Joyes dated May 24, 1919, copies of which are attached hereto marked "Exhibit B" and made a part hereof, and the rights of the parties under this contract shall be defined by such proposal and acceptance unless otherwise specifically provided herein.

The United States shall not be released from any obligation or responsibility on commitments made as provided for in said original contract, on or before April 15, 1919.

The United States shall not be relieved of any responsibility to the contractor resulting from the performance of the work covered by said original contract nor does the contractor release or waive any claims not heretofore allowed under said original contract.

This contract, including the proposal and acceptance above referred to, does not change, alter, or amend the terms, conditions and obligations contained in the original contract except as herein specifically set out.

In witness whereof, the parties hereto have caused this contract to be executed in sextuplicate on the day and year first above written, at Washington, D. C., by their officers thereunto duly authorized.

UNITED STATES OF AMERICA,

By R. H. HAWKINS,

*Lieutenant Colonel, Ordnance Department,
United States Army, Contracting Officer.*

Witness:

GENEVIEVE STROHL.

ALABAMA POWER CO.,

By W. N. WALMSLEY,

Its General Manager, Contractor.

Attest:

WALTER M. HOOD, *Secretary.*
(United States of America Seal.)
(Alabama Power Co. Seal.)

STATE OF ALABAMA, *Jefferson County.*

I, Walter M. Hood, secretary of Alabama Power Co., do hereby certify that the following resolution was unanimously adopted by the board of directors of said company at its regular meeting held at the office of the company in the Brown-Marx Building, in the city of Birmingham, Ala., on March 9, 1919, a quorum of the board being present:

"*Resolved*, That hereafter the signatures of two persons, officers or employees of the company, shall be affixed to checks and acceptances, and that the board hereby authorizes to sign such checks and acceptances the president, the vice president, the general manager, the assistant to the president, or the assistant general manager, and the treasurer, the assistant treasurer, or the auditor; and for bills, receipts, and indorsements for deposit, the president, vice president, general manager, treasurer, assistant treasurer, or auditor; and for notes, leases, contracts, and documents, the president, vice president, or general manager, and the secretary or assistant secretary."

And I further certify that the following officers of the company were elected at said meeting for the ensuing term and until their successors are elected and qualified: James Mitchell, president; Thomas W. Martin, vice president; Walter M. Hood, secretary; H. S. Swan, treasurer; H. S. Swan, assistant secretary; M. P. Randall, assistant secretary; and M. P. Randall, assistant treasurer.

And I do further certify that Mr. W. N. Walmsley was heretofore on, to wit, July 1, 1916, duly appointed general manager of the company by the president, and that he is now acting in such capacity.

Given under my hand and the seal of said company at its office in the city of Birmingham, Ala., on this the 11th day of September, 1919.

WALTER M. HOOD,
Secretary Alabama Power Co.

EXHIBIT A.

(Inserted at this place is copy of the contract, dated December 1, 1917, between Alabama Power Co. and the United States of America, and known as contract T-69, which contract has heretofore been placed in the record of these hearings at page 146, et seq.)

EXHIBIT B.

ALABAMA POWER CO.

Washington, D. C., May 24, 1919.

Col. J. W. JOYES,
*Chief Nitrate Division Ordnance Department,
United States Army, Washington, D. C.*

Subject: Contract T-69.

SIR: The certain items of work remaining to be done under contract T-69, and as shown on the accompanying schedule, Alabama Power Co., will complete for its account upon the payment to it of \$17,500 by the United States.

Such material and supplies belonging to the United States, purchased for use in connection with this contract, which may be necessary for the completion of the above-mentioned work, will be available to Alabama Power Co. free of charge.

The above sum includes the cost of testing of the Warrior extension, estimated at \$2,500. Should conditions beyond the control of Alabama Power Co. require that an additional test or tests be made, then Alabama Power Co. will not be obligated to make same, but the contracting officer may request that same be done at the expense of the United States.

The completion of the items shown on the attached schedule will, in our judgment, fulfill the conditions and intent of the construction program covered by contract T-69 as instructed by you February 19, 1919 (T-108458).

It is the understanding that no further work under this contract is to be done at the expense of the United States unless same may be specifically ordered by the contracting officer, and, consequently, upon the completion of the work

herein mentioned, the construction features of contract T-69 will be considered to be finished.

It is not intended that the payment to Alabama Power Co. of the \$17,500 above referred to will commit Alabama Power Co. to responsibility for commitments or obligations incurred by the United States in connection with this contract, or for any claims which may arise thereunder.

ALABAMA POWER CO.,
By W. N. WALMSLEY, *General Manager.*

I certify that the above is a true copy of the original.

C. F. BEAMES,
Lieutenant Colonel, Ordnance Department United States Army.

MAY 24, 1919.

From: J. W. Joyes, colonel, Ordnance Department, United States Army, contracting officer.

To: Alabama Power Co.

Subject: Contract T-69 dated December 1, 1917: Acceptance of proposal of May 24, 1919, for certain work; notice of termination of period of preliminary operation, article 14; notice of suspension of demand, article 21.

1. With mutual consent and agreement on your part and on that of the contracting officer, and because of actual unreadiness of the turbogenerator pertaining to the Warrior extension, the Chief of Ordnance has deemed that the Warrior extension (and therefore "the Warrior extension, the Warrior substation, and the transmission line") was (and were) not, on December 1, 1918, and is (and are) not, at this date, "complete and ready for use in the performance of this contract."

2. Your proposal in your letter of May 24, 1919, to complete the several minor items of work now unfinished and the testing of the Warrior extension still needed for the sum of \$17,500 is accepted as submitted. This understanding will be confirmed by a contract (supplemental) providing for payment of that sum—\$17,500—by the United States upon your certificate that you accept the items as accomplished and the Warrior extension as complete and ready for use in the performance of this contract not later than July 31, 1919.

3. The Chief of Ordnance now deems that, for the purposes of the definition in article 14, and of the provisions thereof, the Warrior extension, the Warrior substation, and the transmission line will be complete and ready for use in the performance of this contract on the 31st day of July, 1919, and therefore sets that date as the definite date of termination of the period of preliminary operation defined in article 14 of the contract.

4. As this date is set in advance, your written acceptance thereof is requested in order that for mutual convenience there may be no future misunderstanding or doubt.

5. Furthermore, the United States, by me, the undersigned contracting officer, hereby serves upon you this written notice as contemplated and provided for by article 21 that the United States does hereby suspend as of July 31, 1919, its demand for energy provided for by said article 21, and that having allowed the full 60 days' notice (and more) the United States does from and after said 31st day of July, 1919, and during the period of such suspension as provided, stand relieved of its obligation to make the minimum monthly payment of \$30,000 and the contractor does, correspondingly and during the same period, stand relieved of the payments mentioned in subdivision (1) of article 17.

6. For certainty of mutual understanding your written acceptance of this notice and of such effect thereof under article 21 is requested.

J. W. JOYES,
Colonel, Ordnance Department, United States Army,
Contracting Officer.

Mr. Dent calls attention to one other act which I wish to mention. There was passed by Congress an act which was approved on March 2, 1919, entitled "An act to provide relief in the cases of contracts connected with the prosecution of the war, and for other purposes," which reads as follows:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of War be, and

he is hereby, authorized to adjust, pay, or discharge any agreement, express or implied, upon a fair and equitable basis that has been entered into, in good faith during the present emergency and prior to November 12, 1918, by any officer or agent acting under his authority, direction, or instruction, or that of the President, with any person, firm, or corporation for the acquisition of lands, or the use thereof, or for damages resulting from notice by the Government of its intention to acquire or use said lands, or for the production, manufacture, sale, acquisition or control of equipment, materials or supplies, or for services, or for facilities, or other purposes connected with the prosecution of the war, when such agreement has been performed in whole or in part, or expenditures have been made or obligations incurred upon the faith of the same by any such person, firm, or corporation prior to November 12, 1918, and such agreement has not been executed in the manner prescribed by law: *Provided*, That in no case shall any award, either by the Secretary of War or the Court of Claims, include the prospective or possible profits on any part of the contract beyond the goods and supplies delivered to and accepted by the United States and a reasonable remuneration for expenditures and obligations or liabilities necessarily incurred in performing or preparing to perform said contract or order: *Provided further*, That this act shall not authorize payment to be made of any claim not presented before June 30, 1919: *And provided further*, That the Secretary of War shall report to Congress at the beginning of its next session following June 30, 1919, a detailed statement showing the nature, terms, and conditions of every such agreement and the payment or adjustment thereof: *And provided further*, That no settlement of any claim arising under any such agreement shall bar the United States Government through any of its duly authorized agencies, or any committee of Congress hereafter duly appointed, from the right of review of such settlement, nor the right of recovery of any money paid by the Government to any party under any settlement entered into, or payment made under the provisions of this act, if the Government has been defrauded, and the right of recovery in all such cases shall exist against the executors, administrators, heirs, successors, and assigns of any party or parties: *And provided further*, That nothing in this act shall be construed to relieve any officer or agent of the United States from criminal prosecution under the provisions of any statute of the United States for any fraud or criminal conduct: *And provided further*, That this act shall in no way relieve or excuse any officer or his agent from such criminal prosecution because of any irregularity or illegality in the manner of the execution of such agreement: *And provided further*, That in all proceedings hereunder witnesses may be compelled to attend, appear, and testify, and produce books, papers, and letters, or other documents; and the claim that any such testimony or evidence may tend to criminate the person giving the same shall not excuse such witness from testifying, but such evidence or testimony shall not be used against such person in the trial of any criminal proceeding.

"Sec. 2. That the Court of Claims is hereby given jurisdiction on petition of any individual, firm, company, or corporation referred to in section 1 hereof, to find and award fair and just compensation in the cases specified in said section in the event that such individual, firm, company, or corporation shall not be willing to accept the adjustment, payment, or compensation offered by the Secretary of War as hereinbefore provided, or in the event that the Secretary of War shall fail or refuse to offer a satisfactory adjustment, payment, or compensation as provided for in said section.

"Sec. 3. That the Secretary of War, through such agency as he may designate or establish, is empowered, upon such terms as he or it may determine to be in the interest of the United States, to make equitable and fair adjustments and agreements, upon the termination or in settlement or readjustment of agreements or arrangements entered into with any foreign Government or Governments or nationals thereof prior to November 12, 1918, for the furnishing to the American Expeditionary Forces, or otherwise for war purposes, of supplies, materials, facilities, services, or the use of property, or for the furnishing thereof by the United States to any foreign Government or Governments, whether or not such agreements or arrangements have been entered into in accordance with applicable statutory provisions; and the other provisions of this act shall not be applicable to such adjustments.

"Sec. 4. That whenever under the provisions of this act the Secretary of War shall make an award to any prime contractor with respect to any por-

tion of his contract which he shall have sublet to any other person, firm, or corporation who has in good faith made expenditures, incurred obligations, rendered service, or furnished material, equipment, or supplies to such prime contractor, with the knowledge and approval of any agent of the Secretary of War duly authorized thereunto, before payment of said award to Secretary of War shall require such prime contractor to present satisfactory evidence of having paid said subcontractor or of the consent of said subcontractor to look for his compensation to said prime contractor only; and in the case of the failure of said prime contractor to present such evidence or such consent, the Secretary of War shall pay directly to said subcontractor the amount found to be due under said award; and in case of the insolvency of any prime contractor, the subcontractor of said prime contractor shall have a lien upon the funds arising from said award prior and superior to the lien of any general creditor of said prime contractor.

"Sec. 5. That the Secretary of the Interior be, and he hereby is, authorized to adjust, liquidate, and pay such net losses as have been suffered by any person, firm, or corporation by reason of producing or preparing to produce either manganese, chrome, pyrites, or tungsten in compliance with the request or demand of the Department of the Interior, the War Industries Board, the War Trade Board, the Shipping Board, or the Emergency Fleet Corporation to supply the urgent needs of the Nation in the prosecution of the war; said minerals to be enumerated in the act of Congress approved October 5, 1918, entitled 'An act to provide further for the national security and defense by encouraging the production, conserving the supply, and controlling the distribution of those ores, metals, and minerals which have formerly been largely imported, or of which there is or may be an inadequate supply.'

"The said Secretary shall make such adjustments and payments in each case as he shall determine to be just and equitable; that the decision of said Secretary shall be conclusive and final, subject to the limitation hereinafter provided; that all payments and expenses incurred by said Secretary, including personal services, traveling and subsistence expenses, supplies, postage, printing, and all other expenses incident to the proper prosecution of this work, both in the District of Columbia and elsewhere, as the Secretary of the Interior may deem essential and proper, shall be paid from the funds appropriated by the said act of October 5, 1918, and that said funds and appropriations shall continue to be available for said purpose until such time as the said Secretary shall have fully exercised the authority herein granted and performed and completed the duties hereby provided and imposed: *Provided, however*, That the payments and disbursements made under the provisions of this section for and in connection with the payments and settlements of the claims herein described, and the said expenses and administration shall in no event exceed the sum of \$8,500,000: *And provided further*, That said Secretary shall consider, approve, and dispose of only such claims as shall be made hereunder and filed with the Department of the Interior within three months from and after the approval of this act: *And provided further*, That no claim shall be allowed or paid by said Secretary unless it shall appear to the satisfaction of the said Secretary that the expenditures so made or obligations so incurred by the claimant were made in good faith for or upon property which contained either manganese, chrome, pyrites, or tungsten in sufficient quantities to be of commercial importance: *And provided further*, That no claim shall be paid unless it shall appear to the satisfaction of said Secretary that moneys were invested or obligations were incurred subsequent to April 6, 1917, and prior to November 12, 1918, in a legitimate attempt to produce either manganese, chrome, pyrites, or tungsten for the needs of the Nation for the prosecution of the war, and that no profits of any kind shall be included in the allowance of any of said claims, and that no investment for merely speculative purposes shall be recognized in any manner by said Secretary: *And provided further*, That the settlement of any claim arising under the provisions of this section shall not bar the United States Government, through any of its duly authorized agencies, or any committee of Congress hereafter duly appointed, from the right of review of such settlement, nor the right to recover any money paid by the Government to any party under and by virtue of the provisions of this section, if the Government has been defrauded, and the right of recovery in all such cases shall extend to the executors, administrators, heirs, and assigns of any party.

"That a report of all operations under this section, including receipts and disbursements, shall be made to Congress on or before the first Monday in December of each year.

"That nothing in this section shall be construed to confer jurisdiction upon any court to entertain a suit against the United States: *Provided further*, That in determining the net losses of any claimant the Secretary of the Interior shall, among other things, take into consideration and charge to the claimant the then market value of any ores or minerals on hand belonging to the claimant, and also the salvage or usable value of any machinery or other appliances which may be claimed was purchased to equip said mine for the purpose of complying with the request or demand of the agencies of the Government above mentioned in the manner aforesaid."

The CHAIRMAN. That is the so-called Dent Act?

Mr. MARTIN. Yes.

The CHAIRMAN. I think we can put that into the hearings. Have you filed any claims under that law?

Mr. MARTIN. No, sir.

Mr. DENT. It was not necessary to file any claims because they had no money demand against the Government.

The CHAIRMAN. Of course that act, as I recall it, was passed in order to validate those claims that had been entered into informally and not in accordance with the strict letter of the law.

Mr. MARTIN. Yes.

The CHAIRMAN. You had no such claims.

Mr. MARTIN. If there was any informality in the execution of the contract—and I am not aware of it—this law would reach the question.

The CHAIRMAN. Then it may not be necessary to put that in the hearings?

Mr. DENT. I do not know that it is necessary to put it into the hearings, but a reference to it may be necessary because I expect to use it in what I have to say to the committee.

The CHAIRMAN. Very well. Is there anything else, Mr. Martin?

Mr. MARTIN. I will be very glad to answer any questions the committee may desire to ask me.

Mr. McKENZIE. Mr. Martin, in order that I may get a picture of this whole thing firmly fixed in my mind, I want to ask you a few questions. As I understand your testimony your company in the fall of 1917, was operating a plant known as the Gorgas plant, on the Warrior River in Alabama, and selling your product to the people living in the surrounding towns and villages, and going on about your business practically unmindful of the fact that we were at war? Is that true?

Mr. MARTIN. No; I do not put it that way. Of course, we all knew we were at war, because every plant we had was affected and this Warrior plant was affected, and 80 per cent of our entire output was supplied to plants in the Birmingham district and other parts of our State engaged in the manufacture of war material.

Mr. McKENZIE. Up to that time, as I understood you, Mr. Martin, you had not entered into any negotiations with the Government, or made any tender of the services of your plant to enable the Government to better prosecute the war?

Mr. MARTIN. The question did not come up until November, 1917. The question was where the nitrate plant might be located, and it only came up in November, 1917.

Mr. McKENZIE. I am just trying to get this picture of the situation down there. So far as your corporation was concerned, you had not made any tender and had not entered into negotiations with the Government to assist in the prosecution of the war, so far as this particular plant was concerned?

Mr. MARTIN. We had notified Col. Joyes that that plant was there and at his service.

Mr. McKENZIE. Did Col. Joyes reply to that?

Mr. MARTIN. In several conversations we did discuss it, and we acquainted him with the situation. Of course, we told Col. Joyes that the plant was there and we would be glad to do anything he cared to have us do about it.

Mr. McKENZIE. You stated along about that time, however, Mr. Washburn came to see you, or came to see the officers of your company, and suggested that the plant might be enlarged, or something to that effect.

Mr. MARTIN. I think he just telephoned Mr. Mitchell, the president, to take up the matter with Gen. Crozier, and that is the way it came up.

Mr. McKENZIE. At that time Mr. Washburn was a stockholder in the Alabama Power Co., was he not?

Mr. MARTIN. He was a stockholder.

Mr. McKENZIE. What other position did he hold in connection with any other company or corporation?

Mr. MARTIN. Connected with us?

Mr. McKENZIE. Any other corporation or company.

Mr. MARTIN. I do not know that—he was president of the American Cyanamid Co., but he was not connected with us in any other way.

Mr. McKENZIE. But he was a stockholder in your company.

Mr. MARTIN. Yes.

Mr. McKENZIE. At the same time he was president of the American Cyanamid Co.

Mr. MARTIN. Yes.

Mr. McKENZIE. And the American Cyanamid Co., as has been testified to here, controlled the patent under which the fixation of nitrogen of the air is carried on.

Mr. MARTIN. I only know what the record states. I have no comments to make on that, because I only know what is in the record.

Mr. McKENZIE. Some years back, of which you perhaps have some knowledge, Mr. Washburn and those connected with him at that time, in 1916, and prior to that time had endeavored to get the Government to begin the construction of certain plants at Muscle Shoals for the purpose of manufacturing nitrate, or adopting a system of the fixation of nitrogen from the air; is that true?

Mr. MARTIN. I only have heard it mentioned here; I had no connection with it.

Mr. McKENZIE. You have no knowledge of it. In December, I think you said it was, you had your first consultation with the representative of the Government in connection with this matter, and the representative with whom you talked was a Mr. Williams?

Mr. MARTIN. No, sir; Col. Joyes, representing the Ordnance Department.

Mr. McKENZIE. Representing the Ordnance Department?

Mr. MARTIN. Yes.

Mr. McKENZIE. From that conversation you entered into a sort of verbal agreement as to what you were to do down on the Warrior River in connection with the Muscle Shoals proposition. Had the work begun at Muscle Shoals at that time?

Mr. MARTIN. I am sure I do not know, Mr. McKENZIE.

Mr. McKENZIE. You are not sure about it?

Mr. MARTIN. I do not know.

Mr. McKENZIE. Do you know what company contracted with the Government for the construction of a plant by the Government for the manufacture of nitrates?

Mr. MARTIN. The contractors?

Mr. McKENZIE. Yes.

Mr. MARTIN. I think it was the J. G. White Co. It is my recollection that they were the contractors.

Mr. McKENZIE. I mean the contractor that undertook the construction of the plant. Was it the Air Nitrates Corporation?

Mr. MARTIN. I have heard that testimony here.

Mr. McKENZIE. Do you know whether or not that is a subsidiary of the American Cyanamid Co.?

Mr. MARTIN. I only know what has been testified to here.

Mr. McKENZIE. You do not know that as a fact?

Mr. MARTIN. No, sir; I do not.

Mr. McKENZIE. Up to that time there had not been any work performed on Muscle Shoals on that proposition.

Mr. MARTIN. I can neither say yes or no, because I do not recall anything about it.

Mr. McKENZIE. There was no activity at Muscle Shoals at that time, as I understand it, and immediately after your company, or the representatives of your company, had this conversation with the representative of the War Department you proceeded to buy the right of way, as I understand it, for the transmission line from the Gorgas plant to Muscle Shoals.

Mr. MARTIN. No; we had the right of way, and for about one-third of the distance we had service lines on it, serving other districts, and on the suggestion of Col. Joyes, or at his request, we had to purchase the remainder of the right of way.

Mr. McKENZIE. You proceeded to purchase the right of way up to Muscle Shoals?

Mr. MARTIN. Yes.

Mr. McKENZIE. That was prior to the commencement of the construction work at Muscle Shoals, was it not?

Mr. MARTIN. I do not know.

Mr. McKENZIE. You are not sure about it?

Mr. MARTIN. No, sir; I am not sure about it.

Mr. McKENZIE. Did you purchase that right of way with the funds of the Alabama Power Co., or with money furnished by the Government?

Mr. MARTIN. With the funds of the Alabama Power Co.

Mr. McKENZIE. You own that in fee?

Mr. MARTIN. We own the easement in fee; we do not have a fee title.

Mr. McKENZIE. The right of way?

Mr. MARTIN. The right of way.

Mr. McKENZIE. And over that right of way you proceeded to construct the transmission line from your Gorgas plant to Muscle Shoals, and did construct it.

Mr. MARTIN. Yes, sir; and it was in operation for a distance of 88 miles within five months, long before there were any Warrior extension, and we were supplying power over it within five months for the use of the Government.

Mr. McKENZIE. Was that done to help out the Government?

Mr. MARTIN. That is what we did it for.

Mr. McKENZIE. Was your purpose to help out the Government, or having in mind the sale of power?

Mr. MARTIN. Well, we did it because the Government requested us to do it. The question of the sale of power—the primary question was that the Government wanted the power.

Mr. McKENZIE. Let us keep this in mind. Mr. Washburn came to see you, and after Mr. Washburn came to see you you had this interview with the representatives of the Government and they requested you to build this transmission line from the Gorgas plant, on the Warrior, up to Muscle Shoals, alleging that it was necessary to aid the Government in carrying on the war.

Mr. MARTIN. I would not say alleging; I can only speak of the way those gentlemen treated it.

Mr. McKENZIE. I do not want to put the matter in a false light.

Mr. MARTIN. Col. Joyes said his plan was to construct a nitrate plant and to have the first unit or division of it in operation in six months, and our system furnished the only available means of getting power for the operation of the unit in that time.

Mr. McKENZIE. Going back a little, Mr. Martin, when you constructed the original plant on the Warrior River at Gorgas, you laid the foundation for a 3-unit plant, as I understood you?

Mr. MARTIN. Yes.

Mr. McKENZIE. And with one water intake. You only completed one unit of it in the beginning?

Mr. MARTIN. Yes.

Mr. McKENZIE. And at that time you only had one unit completed from which you were selling power?

Mr. MARTIN. That was only a reserve at that time. Our principal station at that time, Mr. McKENZIE, was the water-power plant at Lock No. 12, in the Coosa River. This Warrior plant was the reserve station for our system.

Mr. McKENZIE. Looking to the future, you had laid the foundation for a 3-unit plant?

Mr. MARTIN. Yes, sir.

Mr. McKENZIE. I am not criticizing that as a business proposition. Then you entered into this contract with the Government?

Mr. MARTIN. After we had ordered our second unit, in the latter part of 1917. At that time we had plans made for installing a second unit of our own, which we did not complete.

Mr. McKENZIE. You had not undertaken it up to that time?

Mr. MARTIN. No.

Mr. McKENZIE. Then you went into this arrangement with the Government, and under that contract the Government was to pay for the construction of this plant with the transmission lines?

Mr. MARTIN. Of this section of the plant; yes.

Mr. McKENZIE. Did you undertake the building of that—that is, your company?

Mr. MARTIN. Yes.

Mr. McKENZIE. Did you have a cost-plus contract with the Government?

Mr. MARTIN. Cost plus a fixed fee; yes.

Mr. McKENZIE. How much did your company receive as a fee for constructing that?

Mr. MARTIN. It is stated in the contract.

Mr. McKENZIE. I wish you would put that in the record.

Mr. MARTIN. It was \$225,000 plus \$60,000, a total of \$285,000.

Mr. McKENZIE. Now, then, did the representatives of the Government at that time understand you were building this plant as an addition to your own plant, or as a separate unit?

Mr. MARTIN. As an extension.

Mr. McKENZIE. Then, as a matter of fact, you simply dovetailed onto the property you then owned and operated at Gorgas another addition paid for with Government money, and on which you got a fee for the construction?

Mr. MARTIN. We extended our plant, that was the effect of it; made an extension of it for the purpose of supplying the Government with the power from our system.

Mr. McKENZIE. The Government paid all the bills and you simply constructed it.

Mr. MARTIN. Yes.

Mr. McKENZIE. Was that sort of a plant the suggestion of the Government officials or was it your suggestion that it be done in that way?

Mr. MARTIN. I do not recall that. The main point was this: The question arose first of whether the Government could advance the funds in any way to us to enable us to make the extension. We found it was impracticable, upon application to the War Credits Board, to make an advance of those funds, and the question of credits on all kinds of propositions such as ours was a very serious one. The granting of credits on such propositions was seriously curtailed and the Government had absorbed all the credits at that time, so the question was how we could finance this extension. That was the question.

Mr. McKENZIE. It is true, is it not, Mr. Martin, that the Government could have constructed a steam plant at Muscle Shoals at the same time and had it at no greater cost than for constructing this one?

Mr. MARTIN. Mr. McKENZIE, coincidentally the Government began the construction of a steam plant at Muscle Shoals, and completed that steam plant in the year 1919, long after the war was over, and they did it with the utmost speed. But they had to start from the ground up, and the Government had power six, seven, or eight months before the steam plant was constructed at Sheffield.

Mr. McKENZIE. Before the nitrate plant was completed, too?

Mr. MARTIN. Yes; we had our line ready and waiting. The Government began to use it in June or July.

Mr. McKENZIE. As a matter of fact, you had your plant all completed and ready for operation before the Government had any use for it at all.

Mr. MARTIN. Yes; they had begun to use our power—the line was ready on May 15, and the Government began to use the power about the 1st of June for construction purposes, and for operating purposes some time in August.

Mr. McKENZIE. Now, Mr. Martin, I want to ask you, as a business man, are you a lawyer?

Mr. MARTIN. Yes; I am a lawyer.

Mr. McKENZIE. And as a lawyer if it is not your judgment that with this particular addition hooked onto your plant in the manner in which it was hooked on and constructed that you practically shut out any other purchaser than the Alabama Power Co.?

Mr. MARTIN. You ask me my judgment?

Mr. McKENZIE. Yes; as a practical proposition.

Mr. MARTIN. As a practical question, yes. There could not be two operations at that plant in the very nature of things; it is not adapted for two operations.

Mr. McKENZIE. But in order to be doubly secure in protecting yourself—and I do not censure you for that—you entered into an agreement whereby you tried to tie the hands of the Government with a proposed option, giving you the option to buy the plant. Is not that true?

Mr. MARTIN. Mr. McKENZIE, we agreed to buy on the demand of the Government at a fair value. It never occurred to us that the day would come when this Government would want to take away our station and destroy our property

there in order to give it to some one else, and it was never contemplated that the Government would do otherwise than realize a fair value out of what it had erected.

Mr. MCKENZIE. Mr. Martin, you have stated that your company was anxious to serve the Government, and that that was your purpose in the matter, unmindful of any selfish interests. Did you have a reciprocal provision in your contract that you would sell to the Government at a fair value?

Mr. MARTIN. The land?

Mr. MCKENZIE. The plant. Did you have a reciprocal proposition that the Government could buy your property in case they did not desire to sell to your company?

Mr. MARTIN. No; in the first place we had a general mortgage on it and we could not agree to sell it.

Mr. MCKENZIE. You could sell it subject to the mortgage, could you not?

Mr. MARTIN. I do not suppose that there would be a very good title to a piece of property with a \$10,000,000 mortgage on it.

Mr. MCKENZIE. You could have sold your equity, could you not?

Mr. MARTIN. We could not do it.

Mr. MCKENZIE. At any rate, you did not.

Mr. MARTIN. We did not.

Mr. MCKENZIE. But the provision was in there that if the Government ever desired to sell this property the Alabama Power Co. should be the purchaser.

Mr. MARTIN. Would buy at a fair value.

Mr. MCKENZIE. And had the preference.

Mr. MARTIN. I think, very naturally, being on our land, and its being a part of our system, as a basis on which we were performing public service.

Mr. MCKENZIE. Being a lawyer, you understand that the law of this country has been in time of peace that the War Department, represented by Col. Joyes, who happened to be our representative, apparently, in many of these contracts, and who seemed to feel that he had authority to do as he pleased with Government property—in peace times the War Department can not sell real estate belonging to the Government without an act of Congress giving them authority. You were aware of that, were you not?

Mr. MARTIN. I was aware of that.

Mr. MCKENZIE. Then all your contention is based on the war-time legislation in the act you have read in our hearing here this morning?

Mr. MARTIN. Our contention?

Mr. MCKENZIE. Your contention that the contract is legal is not founded on the general law of the country, but on the war-time legislation you have read to us this morning.

Mr. MARTIN. Wholly aside from the legislation, the Government bound us to buy it at a fair value on its demand; and when the legislation came into being, then it was that the Government agreed to sell to us on our demand.

Mr. MCKENZIE. This New York gentleman, who, at that time, had on a soldier's uniform, I presume, and was connected with the Ordnance Department, agreed with you that that contract was good, and that the Government would be bound under the provisions of that contract?

Mr. MARTIN. I am sure he did, or he would not have executed it, if he had doubted the legal authority to do so.

Mr. MCKENZIE. Of course, I am not going to enter into a discussion with you about the legality or the illegality of it, except that I simply want to say this, that in my judgment the Government's hands are just about as effectively tied in the manner in which this thing was done as they could possibly be tied by any legal contract. And I may have the wrong view of what the aiding of the Government consists of. But I ask you now, to have it go into the record, if it is your view of the matter that the construction of the plant in the way in which this plant was constructed and the entering into the character of contract which is in evidence is a proper evidence of supporting the Government?

Mr. MARTIN. I certainly think the company acted fairly and justly in this matter. We have agreed to purchase this property at the demand of the Government at a fair value. We have complied with every request made of us by the Government; we hold ourselves ready to carry out that plan. You will find many contracts made during the war by which extensions and enlargements of plants were made on the property of others, and in how many of them will you find a provision which requires the owner of the land to pay fair value as distinguished from junk value? We think we are in a position to protect the Government. Naturally, this plant was part of our system, a system on which we

had built up public service. To create two separate and distinct operations there would vitally interfere with our whole arrangement and our whole public service.

Mr. McKENZIE. Let me ask you, How do you arrive, in such matters as this, at a fair valuation?

Mr. MARTIN. The contract provides for the selection of arbitrators. The Government selects one, the company selects one, and those two select the third, and they consider the question of fair value in the light of those principles of law which would naturally govern a court in determining value.

Mr. McKENZIE. It is true that a fair valuation is such a valuation as the property would have in the community in which the property is located, as a general proposition. Is not that one way of arriving at fair valuation?

Mr. MARTIN. Is not that a different question? I doubt whether that would be the basis here.

Mr. McKENZIE. That is the general rule. But the general rule of fair valuation could not apply in this case, because there would be no competition.

Mr. MARTIN. Yes.

Mr. McKENZIE. No one could bid on it.

Mr. MARTIN. If you ask me that question, I do not believe that principle would apply here, because we engaged to buy it at a fair value, which means its value as a going extension, and it is a going property.

Mr. McKENZIE. You are willing to do that now?

Mr. MARTIN. Yes, sir; we are willing to carry out our contract to the letter.

Mr. McKENZIE. Do you feel, Mr. Martin, that in serving the Government at this time you made any great sacrifice?

Mr. MARTIN. I have explained to you what we expended. We have never had any of it paid back.

Mr. McKENZIE. Are you operating that plant at the present time?

Mr. MARTIN. Well, not at this moment, because the rivers are full now. We are not operating it this very day.

Mr. McKENZIE. I understand you are paying a rental to the Government?

Mr. MARTIN. Yes; we are paying a rental to the Government.

Mr. McKENZIE. How much are you paying?

Mr. MARTIN. It is a mill and a half per kilowatt hour of power generated.

Mr. HULL. What are you receiving for power at the present time?

Mr. MARTIN. What are we receiving?

Mr. HULL. Yes; what are your prices?

Mr. MARTIN. Delivered?

Mr. HULL. Yes.

Mr. MARTIN. It ranges from 5 mills up, delivered over our transmission system.

Mr. HULL. I mean per horsepower?

Mr. MARTIN. It averages about \$25 per horsepower per year, delivered.

Mr. HULL. How does that compare with the price received generally by power companies, say at Niagara Falls, for primary power?

Mr. MARTIN. I have some records of comparison here. This is taken from a Department of Commerce publication dated in 1920, showing the cost per horsepower hour to the consumer of light and power generated at central electric stations, based on the use of 3,000 hours per year. For Alabama, the price per horsepower hour in 1907 was 2 cents. In 1912 it was 1.9 cents, and in 1917 the price had gone to 7 mills. There was a reduction from 2 cents to 7 mills. In 10 years it went from \$72 per horsepower to \$21, and that is the average in Alabama to-day.

In Georgia the price is the same as in 1907. In Mississippi the price per horsepower was \$96 in 1907, and \$93 in 1917. The price per horsepower hour in Mississippi was 3 cents in 1907, and it is 3 cents now. So, taking the lowest and the highest, taking Alabama at 7 mills and Mississippi at 3 cents you can get an idea of what the average is, and the same thing is true in connection with the price per horsepower per year, \$21 for Alabama and \$93 for Mississippi.

Mr. HULL. Why is there that discrepancy?

Mr. MARTIN. It is due to the fact that there is no hydroelectric development in the State of Mississippi. There are no large central stations distributing power, and hence there is that great discrepancy.

Mr. HULL. How does that compare with the price you are paying to the Government for the power you are getting from the Government?

Mr. MARTIN. We pay the Government, but we are supplying all the fuel and we transmit the power.

Mr. HULL. There can be no comparison there.

Mr. JAMES. Who drew up this contract?

Mr. MARTIN. I have explained that Col. Williams was the officer representing the Government.

Mr. JAMES. Did he draw it up or did you draw it up?

Mr. MARTIN. You know it is a question of how lawyers work together. He drew a part of it and I drew a part of it, and we worked together until it was completed.

Mr. JAMES. Did you draw up section 22?

Mr. MARTIN. I do not recall now.

Mr. JAMES. Was it your suggestion or his suggestion?

Mr. MARTIN. As to what?

Mr. JAMES. Section 22.

Mr. MARTIN. Well, I could only say it was drawn up in a mutually satisfactory form. He undoubtedly drew a part of it, and undoubtedly I made suggestions as to a part of it.

Mr. JAMES. In regard to the suggestion for the purchase of it by your company, was that your idea or his idea?

Mr. MARTIN. I can not say, Mr. James. But I will take the responsibility of saying it was ours.

Mr. JAMES. Did you consult any outside attorney in regard to the wording of section 22?

Mr. MARTIN. I do not think we did.

Mr. JAMES. Why was there a delay of 11 months in having the contract signed?

Mr. MARTIN. I was living in Alabama and these gentlemen were living in Washington. Capt. Noble died in the midst of the work. There is no particular reason I could give. It was one of the many contracts not completed.

Mr. JAMES. How long did you talk with Col. Williams when you saw him in New York City?

Mr. MARTIN. I met him several times.

Mr. JAMES. I mean the last time.

Mr. MARTIN. Probably five minutes.

Mr. JAMES. Did you see Col. Beames?

Mr. MARTIN. No.

Mr. JAMES. How much of a bond did you put up to guarantee the faithful performance of the contract against labor liens, etc.? Was it \$50,000?

Mr. MARTIN. It was \$50,000.

Mr. JAMES. When was it put up? I see by the contract you had a year to put it up.

Mr. MARTIN. It was put up within that time.

Mr. JAMES. Within a year? Was there not a bond given to the United States before a year after you first started negotiations or started work?

Mr. MARTIN. My recollection is that it was given after the contract was actually executed.

Mr. JAMES. That was a year after you got the contract for the station?

Mr. MARTIN. Yes; while the contract was in process.

Mr. JAMES. The work started in December, 1917, and you did not put up a bond until December, 1918, did you?

Mr. MARTIN. That is my recollection.

(Thereupon a recess was taken until 2 o'clock p. m.)

AFTER RECESS.

The committee met, pursuant to recess, at 2 o'clock p. m.

STATEMENT OF MR. THOMAS W. MARTIN—Resumed.

The CHAIRMAN. Mr. Martin, we will proceed, and Mr. Kearns would like to ask you some questions.

Mr. KEARNS. At the time the Government entered the Warrior plant, how much money had you invested in that plant?

Mr. MARTIN. In the plant and in services and stations and lines leading back to our system we had invested approximately \$3,000,000, but you might remember this, Mr. Kearns, in building a steam plant, which is a reserve, for a system such as ours, we also add water-power equipment, and then add steam to balance it up, so that you can not segregate the investment in steam from the investment in the main system, because one goes to balance the other.

Mr. KEARNS. Then the Government has no interest in the steam system?

Mr. MARTIN. No; as I say, this \$3,000,000 which I spoke of as investment in line and equipment in connection with the Warrior station was only a part of our whole system which represented some \$35,000,000 of investment.

Mr. KEARNS. Since this contract was entered into between your company and the Government, how much money, by virtue of the contract, has the Government invested there?

Mr. MARTIN. Approximately \$5,000,000 was invested in the plant, substation, and the transmission line to Sheffield.

Mr. KEARNS. Does that include the extension?

Mr. MARTIN. Yes.

Mr. KEARNS. That includes the extension, the substation, and transmission lines?

Mr. MARTIN. Yes.

Mr. KEARNS. And that was approximately \$5,000,000?

Mr. MARTIN. \$5,000,000.

Mr. KEARNS. Then the Government has invested \$5,000,000 and your company has invested \$3,000,000?

Mr. MARTIN. We have \$3,000,000 in the station; \$5,000,000 was the Government's investment in plant and line; in the plant the Government had approximately \$3,400,000.

Mr. KEARNS. Whatever right you have to purchase from the Government is found in article—what is the number of that article?

Mr. DENT. Article 22, I think it is.

Mr. KEARNS. Yes; article 22 of your contract, which is dated December 1, 1917; is that right?

Mr. MARTIN. Yes, sir.

Mr. KEARNS. I am now reading from article 22: "At any time subsequent to three years after the termination of the war the United States shall have the option to sell to the contractor, and the contractor shall, upon written demand of the United States, buy all its rights, title, and interest," and so on. If the United States fails to exercise its option, how would you have the right to buy?

Mr. MARTIN. Under the next succeeding provision, Mr. Kearns. Under subdivision 3 you will notice this language:

"The contractor may also at any time demand that the United States convey to it all of the right, title, and interest of the United States in and to the Warrior extension and the Warrior substation upon payment to the United States of any excess of the actual cost of said properties over the amount of said accumulated fund then in the possession of the United States."

Mr. KEARNS. If the United States entered into this contract with you in order to get possession of your plant as a war activity, how was it going to avail itself, under section 3 of that plant, if you had the right at any time to buy it out?

Mr. MARTIN. We might buy the title, continuing our obligation to the United States to deliver power.

Mr. KEARNS. But there is nothing in the contract saying you would be under any further obligation.

Mr. MARTIN. Yes.

Mr. KEARNS. Where is that?

Mr. MARTIN. You will find that—

Mr. KEARNS (interposing). There is not anything in section 22.

Mr. MARTIN. You will find our obligation that we shall deliver power for a period of 10 years.

Mr. KEARNS. Then what do you mean in section 3 that you have the right, on your demand, to compel the United States to turn over all of its right, title, and interest in that plant to you?

Mr. MARTIN. Yes; but that does not relieve us of the obligation to deliver power by another provision of the contract.

Mr. KEARNS. This contract was entered into on December 1, 1917, or it bears that date.

Mr. MARTIN. Yes, sir; it bears that date.

Mr. KEARNS. When was this contract actually entered into?

Mr. MARTIN. On the date of the false report of the armistice, 1918.

Mr. KEARNS. That was some time in November?

Mr. MARTIN. Yes, sir; November 9.

Mr. KEARNS. About the 2d or 3d of November, was it not?

Mr. MARTIN. November 9.

The CHAIRMAN. The date of the actual armistice was November 11.

Mr. KEARNS. Yes; but he refers to the day of the false report.

The CHAIRMAN. That was about three or four days before that.

Mr. KEARNS. I thought it was earlier in November than that, about the 4th.

The CHAIRMAN. No; I think it was a little later than that.

Mr. KEARNS. At that time this statute had been passed that would authorize the Secretary of War to sell this or any other plants.

Mr. MARTIN. Yes.

Mr. KEARNS. But at the time this contract bears date—that is, on December 1, 1917—that statute, of course, had not been passed.

Mr. MARTIN. That is true, Mr. Kearns.

Mr. KEARNS. And were it not for this enabling statute, you would not have any authority to enter into this contract?

Mr. MARTIN. The United States could not bind itself to agree to sell to us.

Mr. KEARNS. Yes; that is what I mean.

Mr. MARTIN. That is correct, Mr. Kearns. Of course, I suppose that you gentlemen who have been on this committee can appreciate the position in which many manufacturers, many producers of equipment, and many contractors were in in the early days. There were thousands of people who went ahead on verbal requests or requests by telephone or any kind of request from Government officials to produce equipment or what not for the purpose of going forward with the war program. The question of contract rights and obligations were secondary. The question was to do the thing that the officials of the Government wanted. The question of terms and conditions and obligations of the contracts remained to one side while we were doing the work the Government wanted.

Mr. KEARNS. Does your company claim any right to the buildings that the Government built on your land, aside from what rights you are given under the statute that was passed after December 1, 1917?

Mr. MARTIN. No.

Mr. KEARNS. What is your answer?

Mr. MARTIN. If I understand your question, you mean do we claim any right by virtue of the fact that they are fixtures?

Mr. KEARNS. Yes.

Mr. MARTIN. We do not. We simply recognize the Government has the right, title, and interest in that property, and that the Government has agreed to sell it to us at a fair value, and whatever that property appraises at as the fair value under this contract we think we have a contract with the Government to purchase it.

Mr. KEARNS. Let me see if I understand you, Mr. Martin. Your company is not claiming any interest in that part that the Government erected on this land except what rights you are given under this statute passed subsequent to December 1, 1917?

Mr. MARTIN. And the contract entered into, which is under discussion here.

Mr. KEARNS. Now, let me understand you. Would you claim any right because the Government without authority entered upon your premises and erected buildings on your land; do you claim a right to retain those buildings?

Mr. MARTIN. No; Mr. Kearns, we do not.

Mr. KEARNS. You do not claim that?

Mr. MARTIN. No.

Mr. KEARNS. All the rights you are claiming are under and by virtue of your contract as construed under the statute which was passed, giving the Secretary of War authority to dispose of real estate?

Mr. MARTIN. You say as construed by the Secretary of War. We can not agree with the construction that the law officers of the Government place upon it. We claim our legal rights as expressed here and as interpreted by ourselves under this contract.

Mr. KEARNS. Has the Government taken any power under this contract?

Mr. MARTIN. Yes.

Mr. KEARNS. For how long has the Government been using power generated by your company?

Mr. MARTIN. I will put it in this form: The Government had the right to take energy, making payment therefor under the specific terms of this contract. It might suspend the taking of energy, under the terms of this contract, for a time and take energy from our system on a different basis. It suspended the taking of energy under this contract and has all along been taking energy from us

under a separate arrangement, as a power company, because it did not need the volume of power, by reason of the armistice coming, that was contemplated in the making of the contract.

Mr. KEARNS. Has the Government each month been paying you \$30,000?

Mr. MARTIN. Oh, no, sir; it never has paid us \$30,000 a month.

Mr. KEARNS. It provides for that in this contract.

Mr. MARTIN. Yes, Mr. Kearns; it does provide that the Government, so long as it takes power under this contract, shall pay \$30,000 a month as a minimum charge. It never did pay the \$30,000 a month, and it never did take under this contract. You will see that the very next section says that the Government may suspend the taking of power under this contract, whereupon its obligation to pay \$30,000 a month ceases, and we got formal notice from the Government that they desired to suspend its right to take power under this contract, which we accepted, of course, and thereupon the Government arranged with us, wholly independently, to serve power to the Government from our system in a very much less quantity, paying therefor at rates in effect by the public service commission.

Mr. KEARNS. Just one more question, Mr. Martin: Your company does not claim anything at Muscle Shoals except the Warrior plant and its connecting lines?

Mr. MARTIN. At Muscle Shoals?

Mr. KEARNS. Yes.

Mr. MARTIN. Yes; we have——

Mr. KEARNS. I mean any part that would be included in the Ford offer.

Mr. MARTIN. Yes. The Alabama Power Co. owns in fee simple the abutment sites at the proposed Dam No. 3, which the Government is asked to construct under the Ford offer.

Mr. KEARNS. And that is included in the Ford offer?

Mr. MARTIN. Yes, sir; the abutment sites and some other lands which we own in fee simple.

Mr. KEARNS. At how much money do you value that interest?

Mr. MARTIN. I could not answer that question, Mr. Kearns. We have never placed any value on it. We have owned it for many years.

Mr. KEARNS. Have you not any idea of what the value of that property is?

Mr. MARTIN. I could not undertake to express any opinion on that question now. The property has been in our possession and ownership for 10 or 15 years, in our company and its preceding company.

Mr. KEARNS. Did the Government ever make any contract with you for that?

Mr. MARTIN. No, sir.

Mr. KEARNS. And you have no idea what that interest would be worth?

Mr. MARTIN. No; none that I would care to express now, Mr. Kearns.

Mr. KEARNS. Then, if Congress should authorize the Secretary of War to accept the Ford offer, then it would be transferring to Ford a part of your property for which the Government never had any kind of a contract.

Mr. MARTIN. That is correct, Mr. Kearns. We did convey to the Government, in fee simple, several years ago, the site at which the Wilson Dam is being erected. We also owned that and we conveyed that to the Government in 1918 for \$1.

Mr. KEARNS. But that does not include these other properties?

Mr. MARTIN. No, sir; that land which constituted the abutment sites of Dam No. 2, the Wilson Dam, we had expended upward of \$500,000 on its development, and at the inception of the war we were asked to hasten the whole program and we conveyed that title to the Government for \$1.

Mr. KEARNS. Was there a provision in the contract or in this conveyance whereby the Government was to return it to you?

Mr. MARTIN. No, sir; we practically donated it to the Government.

Mr. KEARNS. You donated \$500,000 worth of property to the Government for \$1?

Mr. MARTIN. Yes, sir. I have in my hands the letter, if you care to know about it, to the Government officers, tendering it, giving our reasons for it, and the answer of the Secretary of War acknowledging it with thanks and appreciation, if you would like to hear it, I would be glad to read it.

Mr. KEARNS. You can put that in the record.

Mr. HILL. May he not read that, Mr. Chairman; I would like very much to hear it.

The CHAIRMAN. Is it very long, Mr. Martin?

Mr. MARTIN. No, sir.

The CHAIRMAN. Then you might read both the letter transmitting the offer and also the letter accepting it.

Mr. MARTIN. I am reading from a letter dated February 18, 1918:

ALABAMA POWER Co.,

Birmingham, Ala., February 18, 1918.

Col. C. KELLER,

Corps of Engineers,

Office of the Chief of Engineers, United States Army,

Washington, D. C.

SIR: Following the several interviews which I have had with you recently on the subject of the desire of the Government to acquire him the Muscle Shoals Hydroelectric Power Co. the dam site and certain other properties at Muscle Shoals, I have conferred fully not only with the directors of that company but also with the representatives of the security holders of the Alabama Traction, Light & Power Co. (Ltd.). As I believe I explained to you, the last-mentioned company is interested by reason of its stock holdings in Alabama Power Co., which latter company owns the stock of the Muscle Shoals Hydroelectric Power Co.

The properties in question represent a very heavy investment by our company, and have occupied an important position in our plans for securing power for the future. For several years we have worked on plans for ultimately developing these water powers as an integral part of the hydroelectric system which will be required by our companies to meet the needs of the communities which they serve. Much of this work was done by us in collaboration with the Army engineers, looking toward a development in co-operation with the Government on some such plan as was favorably reported on by the Army engineers in House Document No. 1262, Sixty-fourth Congress, first session.

I am adverting very briefly to these features, as I judge from the several interviews which I have had with you and with other representatives of the Government that you are fully aware of what the company has done in preparation for the ultimate development of this water power, and I believe you appreciate that it should receive consideration in the disposition of any surplus power not required for the needs of the Government.

From our recent interviews it is obvious that our respective views as to the value of our property and the price which you would agree to pay are quite irreconcilable. As directors of a large public-service corporation, we have always believed that in addition to the development of our water powers at Muscle Shoals being a very valuable and necessary complement to our system throughout the State, the large industrial community which would grow up at Muscle Shoals would add a special value to that power plant. In times like these, however, such considerations must be secondary to the urgent needs of the Nation to secure these properties immediately for the carrying out of the Government project for the production of war nitrates, and we have accordingly determined to donate our lands to the Government for this purpose. I have already given instructions to the company's attorneys for the preparation of the necessary deeds of conveyance.

It is our understanding from you that the Government only desires to acquire the site at Dam No. 2 and adjacent properties, with flowage easement on such of our other properties as may be affected by this development.

I need hardly assure you of the desire of the company to cooperate with the War Department to the fullest extent in placing at your disposition the benefit of all our engineering studies and records relating to the projected development.

I trust that this disposition of the matter meets with your views.

Yours, very truly,

JAMES MITCHELL, *President.*

Then, on the 20th of February, 1918, a letter from the Secretary of War:

WAR DEPARTMENT.

Washington, February 20, 1918.

Mr. JAMES MITCHELL,

President Alabama Power Co., Birmingham, Ala.

DEAR SIR: Referring to your letter of the 18th instant, addressed to Col. Keller, in which you express the willingness of your company to donate to the United States certain properties and flowage easements needed for the

proposed Federal power development at Muscle Shoals, I beg to acknowledge with thanks the company's generous and public-spirited action.

The further steps necessary in regard to the matter will be given immediate attention.

Very truly, yours,

NEWTON D. BAKER, *Secretary of War.*

Then, I have in my hand a photograph of the check which we received from the United States in the sum of \$1 in payment for these lands.

Mr. KEARNS. And that was land connected with Dam No. 2?

Mr. MARTIN. Dam No. 2, the Wilson Dam.

Mr. KEARNS. Which had cost your company \$500,000?

Mr. MARTIN. Yes, sir; slightly less than \$500,000 we had expended in connection with that development.

Mr. KEARNS. Would the other land which you have at Muscle Shoals, or other property of whatever character that is included in the Ford offer, either land or property, or land and property, be worth as much as the land at Dam No. 2 that you transferred to the Government for \$1?

Mr. MARTIN. Would it be worth as much?

Mr. KEARNS. Would it be worth as much or more?

Mr. MARTIN. I would not want to say whether it was worth as much or more, but \$500,000 does not measure the value of the land.

Mr. KEARNS. The value of the land you still have there?

Mr. MARTIN. Yes, sir.

Mr. KEARNS. That is included in the Ford offer?

Mr. MARTIN. Yes, sir. Of course, our expenditures in that connection cover a long period of years, investigations and studies and plans and what not. We had some engineering and borings at the sites and we carried on for years civil engineering work as well as the purchasing of land.

Mr. KEARNS. At the time these letters were written, your letter offering your land at Dam No. 2 to the Government for \$1, and the Government's acceptance, was that before or after you had entered into your contract for the air nitrates plant?

Mr. MARTIN. You mean whether it was before or after this Warrior situation arose?

Mr. KEARNS. I mean before or after you had donated or really given these rights to Dam No. 2 to the Government.

Mr. MARTIN. We started in on the Warrior extension work with the Government late in December, 1917. This matter of donating the land to the Government arose in February, 1918, two months later.

Mr. KEARNS. Two months after that.

Mr. MARTIN. Approximately two months.

Mr. McKENZIE. If you will pardon me, Mr. Kearns, following your question, the point which it occurs to my mind Mr. Kearns is trying to arrive at, is whether or not at the time you wrote this letter to the War Department and they replied, whether that was subsequent to the date of the contract entered into between the Air Nitrates Corporation and the Government of the United States covering the plant constructed by the Air Nitrates Corporation.

Mr. MARTIN. I do not know the date of that contract, Mr. McKenzie.

Mr. KEARNS. Whatever land you own, however, at Muscle Shoals, that is to be included in the Ford offer, you realize the Government would have the right to condemn?

Mr. MARTIN. Of course, no one questions the right of the Government to condemn property for governmental purposes in accordance with the Constitution, Mr. Kearns. There are limitations upon those questions, possibly.

Mr. MILLER. Prior to the war, the Alabama Power Co. was engaged in this business of creating and distributing power generally throughout the State of Alabama or the northern portion of it, and in the progress of its enterprise it installed this plant on the Warrior River.

Mr. MARTIN. Yes, sir; that is correct.

Mr. MILLER. As you say, a relay plant or a reserve plant.

Mr. MARTIN. A reserve plant; yes.

Mr. MILLER. And for the purpose of being a reserve plant, and to function as such, it was connected up with your distribution system?

Mr. MARTIN. Yes.

Mr. MILLER. That plant is south of a point called Jasper, is it not?

Mr. MARTIN. Yes; it is southeast of Jasper, Mr. Miller.

Mr. MILLER. You had started a line from the Warrior steam plant as far north as Jasper?

Mr. MARTIN. Yes; and as I recall it had also extended somewhat northwesterly from Jasper to certain coal mines.

Mr. MILLER. Now, with that completed before the war and in operation, as your reserve plant or a part of it, it became necessary, then, when the subsequent arrangement was entered into between you and the War Department to complete that transmission line on northward from Jasper to Muscle Shoals?

Mr. MARTIN. Yes.

Mr. MILLER. How many miles is it from the Warrior steam plant to Jasper or about how many?

Mr. MARTIN. It is probably about 20 miles.

Mr. MILLER. And from Jasper on to Muscle Shoals is approximately how far?

Mr. MARTIN. About 68 miles.

Mr. MILLER. Then, so far as the Government's necessities were concerned, the transmission line to be completed to comply with the Government's necessities was 68 miles from Jasper northwesterly to Muscle Shoals?

Mr. MARTIN. No, sir. You see this line from the Warrior plant to Jasper was a 44,000-volt line. It was therefore of small capacity, and you need a 110,000-volt line to transmit power a distance of 90 miles efficiently.

Mr. MILLER. Then you had to practically reconstruct that line?

Mr. MARTIN. No, sir; we did not reconstruct that line. It was a question of building a new line all the way back from the Warrior plant.

Mr. MILLER. From Jasper?

Mr. MARTIN. No; from the Warrior plant.

Mr. MILLER. From the Warrior plant to where?

Mr. MARTIN. To Sheffield.

Mr. MILLER. Then you built two transmission lines.

Mr. MARTIN. The line still stands serving Jasper and other places in that district, on the same right of way, and side by side is a new line constructed from the Warrior plant 90 miles to Sheffield.

Mr. MILLER. Now, I see very clearly that in the construction of the Government's activities there they utilized your foundations at the Warrior plant to construct additional units, and so on, and as a result of the method of construction, whether the most practical or not, the Government's activities there were inseparably interwoven and interlaced with your activities in the physical construction of the Warrior steam plant.

Mr. MARTIN. Yes, sir; that is right.

Mr. MILLER. They were not capable of a division in any wise.

Mr. MARTIN. That is true, Mr. Miller. It was not physically possible to extend the plant and do what was necessary to increase that plant and make it a separately contained plant.

Mr. MILLER. Then, preceding this time, you had a verbal understanding which, eventually, ripened into a contract, which was signed on the day that the false report of the armistice was circulated in the United States, but which dated back to the 1st day of December, 1917; that is right, is it not?

Mr. MARTIN. Yes, sir; that is correct.

Mr. MILLER. Now, simultaneously with the building of the Government's addition to the Warrior steam plant, or very closely connected with it, the Government commenced constructing its own steam plant up at nitrate plant No. 2.

Mr. MARTIN. Yes; that is true.

Mr. MILLER. Which was of a capacity approximately double what they had put in at the Warrior steam plant.

Mr. MARTIN. Yes.

Mr. MILLER. Now, getting back to this contract, the contract was drawn to cover the very contingency that has now arisen.

Mr. MARTIN. It was, Mr. Miller.

Mr. MILLER. And the condition of the Government and the condition of the Alabama Power Co. is just in that status to which your contract applies so far as section 22, I believe, is concerned.

Mr. MARTIN. Yes, sir; neither the Government nor the power company ever contemplated that the United States would desire to engage in the power business, but the Government contemplated that it would desire to purchase power from us, under an arrangement which would insure a fair, honorable, decent way for the Government to get the fair value out of the property it created. That was the basis of our understanding.

Mr. MILLER. Now, let us see what that understanding is. You were to operate not only for your use there at the Warrior steam plant but also to

operate the units installed by the Government or that portion installed by the Government.

Mr. MARTIN. Operate it, maintain it, and insure it at our own expense; yes, sir.

Mr. MILLER. And furnish electric current to the Government?

Mr. MARTIN. Yes.

Mr. MILLER. At 6½ mills per kilowatt hour?

Mr. MARTIN. At 6½ mills.

Mr. MILLER. Now, the Government had put in \$4,978,000, according to the report of the Chief of Ordnance, or as you say, approximately, \$5,000,000, which is correct, I dare say, Mr. Martin.

Mr. MARTIN. It is slightly under \$5,000,000.

Mr. MILLER. Now, you say you had put in your installation at the Warrior steam plant, before the Government made any additions thereto, approximately \$3,000,000.

Mr. MARTIN. Yes.

Mr. MILLER. Then after the Government had embarked jointly with you the investment stood as 3 is to 5; that is right, is it not?

Mr. MARTIN. As 3 is to 5?

Mr. MILLER. You say that before the Government put anything in there you had an investment of approximately \$3,000,000.

Mr. MARTIN. Yes, sir.

Mr. MILLER. And the Government put in approximately \$5,000,000.

Mr. MARTIN. In the power plant and transmission line, together.

Mr. MILLER. Yes.

Mr. MARTIN. There was about \$3,500,000—

Mr. MILLER (interposing). Then your respective interests in the money paid in would be approximately as 8 is to 5?

Mr. MARTIN. In station equipment it is about 3½ to 3.

Mr. MILLER. The Ordnance Department tells us that we have put into the Warrior generating plant \$3,337,000.

Mr. MARTIN. That is correct.

Mr. MILLER. We have put into the Warrior substation \$384,000, and we have put into the transmission lines \$905,000, and then they have included the Drifton Railway with which we are not concerned just now, because I am simply getting at the comparative sums of money that the United States Government and the Alabama Power Co. put in there, and as near as I can get the figures, it is about as 3 is to 5, because the United States Government put in \$5,000,000 and you put in \$3,000,000.

Mr. MARTIN. Now, there are some other elements, if I may call your attention to them.

Mr. MILLER. I am just taking your word that you have put in approximately \$3,000,000 there.

Mr. MARTIN. Prior to that time; yes.

Mr. MILLER. Yes; prior to that time, and at the time the Government came into your activities.

Mr. MARTIN. Yes.

Mr. MILLER. Now, after the Government came into your activities, it put in \$5,000,000, approximately?

Mr. MARTIN. Yes.

Mr. MILLER. Now, what did you put in after the Government came in?

Mr. MARTIN. We put in by way of investment, and certain expenses which I enumerated this morning, something in excess of \$1,000,000, and in addition to that, by this investment in the lines, the Government was enabled to draw on our entire system for its power supply, and you can not overlook the fact of the reserve value of our entire system in connection with the Warrior station.

Mr. MILLER. What I was getting at was the respective amounts of money involved.

Mr. MARTIN. Yes.

Mr. MILLER. You testified this forenoon, I believe, that your expenses in connection with the matter were \$1,016,000?

Mr. MARTIN. That is correct.

Mr. MILLER. Now, we will take \$1,016,000, which, added to your \$3,000,000 of previous investment, would make approximately \$4,000,000.

Mr. MARTIN. Yes.

Mr. MILLER. Then your relations would be about as 4 is to 5?

Mr. MARTIN. If you want to separate the Warrior plant from the rest of the system; yes.

Mr. MILLER. No; I am not separating it. I am keeping it with the plant, and what I am getting at there is who has the major investment there, you or the United States of America? Now, after the Government had put in approximately \$5,000,000, you were to operate this plant and charge the Government 6½ mills per kilowatt hour?

Mr. MARTIN. Yes.

Mr. MILLER. And out of that the Government was to retain a fund of 2 mills, which was to be put into a fund by itself, was it not?

Mr. MARTIN. Yes; that is correct.

Mr. MILLER. Now, this contract further provides that when that accumulating fund of 2 mills shall have reached the amount of the Government's investment, the Government's investment should be turned over to the Alabama Power Co.?

Mr. MARTIN. Yes.

Mr. MILLER. In other words, you were charging the Government 6½ mills per kilowatt hour, and there was 2 mills put down as a sinking fund and retained by the Government, and when those 2 mills should have accumulated into approximately \$5,000,000, the Alabama Power Co. should absorb the entire United States Government holdings there, so far as they related to the Warrior steam plant?

Mr. MARTIN. Now, we have got to get at that 6½ mills and see just what the relations of the parties are.

Mr. MILLER. I am taking the terms of your contract.

Mr. MARTIN. Yes; but we were required to pay to the Government 2 mills as a sinking fund; that is true.

Mr. MILLER. Hold on; was that 2 mills that you were required to pay or was that taken out of the 6½ mills?

Mr. MARTIN. I was going to say that the result is just the same.

Mr. MILLER. I understand that the result mathematically is just the same; but it is quite different from the Government's angle of it. Now, look at your clause 18 or 19 and give me your construction of article 18, on page 154 of part 3 of the hearings. Let me read and see if I am not right:

"The United States shall pay to the contractor [which is the Alabama Power Co.] at the rate of 6½ mills for each k.w.h. of energy actually delivered to the United States at the Warrior substation. Said rate is based upon the power factor of the load of the United States measured at the Warrior substation being no less than 85 per cent. Energy generated at the Warrior extension or the Warrior substation shall be measured at the low tension side of the step-up transformers at said Warrior substation."

The balance of that section relates to the voltage. Now, what I am getting at is where did this 2 mills come from?

Mr. MARTIN. It came in this way—

Mr. MILLER (interposing). Let us get the provision of the contract governing that.

Mr. MARTIN. If you will go back to article 17 you will see "Payments by contractor."

Mr. MILLER. Mr. Martin, is this not covered in article 19?

Mr. MARTIN. Yes; but you have to consider 17 and 19 together, I think, to get at this.

Mr. MILLER. Yes; I see it is referred to in section 17.

Mr. MARTIN (reading):

"Beginning at the termination of the period of preliminary operation mentioned in article 14, and so long as the United States shall require the contractor to supply energy to the United States for the operation of either or both of said nitrate plants, the contractor shall pay to the United States monthly for the use of the Warrior extension and Warrior substation interest at the rate of 6 per cent per annum upon the actual cost to the United States of said extension and substation, less the amount of the accumulated fund referred to in article 19, as the same may vary at each monthly computation of such interest. In computing such cost there shall be excluded all payments by the United States for supervision," etc. " * * * The contractor shall also pay to the United States interest monthly at the rate of 6 per cent per annum upon the sum of \$30,000 expended in the Drifton extension. Now that operated in this manner: There was invested in the Warrior extension, \$3,417,602.70.

Mr. MILLER. Where do you get those figures?

Mr. MARTIN. That is in the record.

Mr. MILLER. You mean that is the Chief of Ordnance estimate.

Mr. MARTIN. Yes, sir.

Mr. MILLER. You are taking then the figures of the Chief of Ordnance?

Mr. MARTIN. Yes, sir. And the Warrior substation, \$383,756.30; Drifton extension, \$30,000, or \$3,831,496.06. We are required to pay 6 per cent on that, or \$229,897.54 a year. That is the interest charge. You have got to take that into account in getting at the question to which you are leading.

Mr. MILLER. Well, we will take it into account. Now, return to paragraph 19 of your contract which reads as follows:

"From and after such date as the contractor shall begin to operate the Warrior extension and Warrior substation as a part of its own system, the United States shall retain 2 mills per k. w. h. from the amounts payable to the contractor by the United States under article 18 hereof, except that (a) in no case shall the said minimum monthly payment by the United States be less than \$30,000, and (b) the United States shall retain no part of the payments due for energy delivered by the contractor at a rate in excess of the capacity at the time of the said Warrior extension."

Now, you are charging there only on the Government's own property; is not that true?

Mr. MARTIN. Six per cent; yes.

Mr. MILLER. They pay you these amounts, then, for that part of your increased capacity, the United States putting in this investment with yours?

Mr. MARTIN. The Government pays us 6½ mills for power and we contract to pay the Government interest on its investment.

Mr. MILLER. But according to exception (b) the United States shall retain no part of the payments due for energy delivered by the contractor at a rate in excess of the capacity at the time of the said Warrior extension, provided that said 2 mills shall no longer be retained by the United States when the accumulated fund shall equal the actual cost to the United States of the Warrior extension and the Warrior substation, computed as set forth in article 11.

Now, when this accumulated fund reached the sum of \$4,417,000, the entire property investment of the United States, so far as it was connected with the Warrior substation, passed to the Alabama Power Co.

Mr. MARTIN. We had paid for it.

Mr. MILLER. But you operated it in the meantime.

Mr. MARTIN. We were to pay a certain amount for it; yes.

Mr. MILLER. How much?

Mr. MARTIN. Actual cost.

Mr. MILLER. Actual cost?

Mr. MARTIN. Yes, sir.

Mr. MILLER. Now, where in your contract do you say that at the time when this accumulated fund should reach the amount of the Government's investment, you should pay the Government what it had invested?

Mr. MARTIN. I do not say that.

Mr. MILLER. No; that is not there.

Mr. MARTIN. You see the theory of this payment of 2 mills was to return to the Government its capital investment.

Mr. MILLER. You returned to the Government its capital investment?

Mr. MARTIN. Yes, sir; we simply repaid to the Government this \$3,800,000.

Mr. MILLER. Now, let us see about that. We will take up that contingency and see how that applies. Let us look at article 22, and I am reading now from the top of page 157, subdivision (b).

"If the value so fixed be greater than said fund, then the United States shall upon payment by the contractor of the amount by which such value is greater than said fund, or payment thereof being secured as hereinafter provided, convey all of its rights, title, and interest in and to said properties to the contractor by proper instruments in writing within 60 days after notice of the award, retaining in payment the whole of said fund."

Mr. MARTIN. Yes.

Mr. MILLER. Now, suppose you purchased the property from the Government, do you take the fund?

Mr. MARTIN. Do we?

Mr. MILLER. Yes.

Mr. MARTIN. No, sir. That was in the event of an arbitration fixing the value of the property at any given figure, whatever might be in this accumulated fund was to go as a credit on that value thus fixed.

Mr. MILLER. Suppose that accumulated fund is equal to the value fixed by the arbitrators as the value of the plant.

Mr. MARTIN. If the value was fixed as the amount in the fund?

Mr. MILLER. Yes.

Mr. MARTIN. Then, there is a provision for conveying the title to the company.

Mr. MILLER. Yes. Now, where does the Government get any money out of it?

Mr. MARTIN. By the payment of the 2 mills. That is a capital payment.

Mr. MILLER. Then you construe it that when this accumulated 2 mills payment should have reached the value of the United States interest there, the United States retained this 2 mills constantly—did you say you paid that to the United States?

Mr. MARTIN. Yes; we certainly would.

Mr. KEARNS. May I ask just one question, Mr. Miller?

Mr. MILLER. Yes.

Mr. KEARNS. I understand the Government was to pay you 6½ mills per kilowatt hour for your energy.

Mr. MARTIN. Yes.

Mr. KEARNS. And instead of paying you the full amount of 6½ mills it would keep 2 mills?

Mr. MARTIN. That is correct.

Mr. KEARNS. And those 2 mills belonged to you?

Mr. MARTIN. Yes, sir.

Mr. KEARNS. And when the 2 mills grew into a sum equal to the amount the Government had invested in your property it was to transfer the property to you; is that it?

Mr. MARTIN. Yes, sir.

Mr. MILLER. Now, that is one element, and let us turn to—

Mr. MARTIN. You understand that 6½ mills was fixed as the base price for energy based on coal at \$2.30.

Mr. MILLER. Yes.

Mr. MARTIN. Based upon that figure of 6½ mills for energy, this arrangement was worked out. Now, we are prepared to defend and show any figures you want and any data you want as to the fairness and correctness of that figure of 6½ mills, and we were to pay the Government 2 mills into that accumulated fund on account of its capital investment in the plant.

Mr. MILLER. I think I understand that. Now, you say you were willing to take that plant from the Government as a going concern and not at its scrap value. It being indivisible and incapable of physical division, this contract was so drawn that you would have no competitor in undertaking to purchase the holdings of the United States Government in the Warrior steam plant, provided the value of the plant or the investment had not been absorbed by this fund of which we have been speaking.

Mr. MARTIN. You assume that there must be a competitor in fixing a fair value.

Mr. MILLER. Yes.

Mr. MARTIN. I think you will agree with me that under the principles of law which govern the ascertainment of fair value they are as well defined as any principles of law. Those principles of law are read into this contract, and, competitor or no competitor, fair value can be fixed.

Mr. MILLER. There is a way of fixing the fair value by what an article would bring in the market, free and open, where the purchaser or any contemplated purchaser would get property capable of segregation and something he could use himself, but no human being who was a bidder on this property in competition with you could ever separate his property from your property down there.

Mr. MARTIN. No, Mr. Miller; but on a reproduction basis, and considering all the elements that must enter into fair value, you do not need to consider the question of competition.

Mr. MILLER. And, furthermore, there is a clause in this agreement that in the event the United States Government should sell this property or its interest therein to any other person except the Alabama Power Co. the plant could not be operated.

Mr. MARTIN. That is correct, Mr. Miller.

Mr. MILLER. Yes.

Mr. MARTIN. And it was put in there because the situation was not capable of being divided into two operating plants.

Mr. MILLER. Then the whole thing was shaped so that the Alabama Power Co. would ultimately absorb the United States interest there, and no other human being could come in competition with the Alabama Power Co.

Mr. MARTIN. There was no way by which this arrangement could be worked out except on a basis of our agreeing to purchase the property at a fair value, and we stand ready and willing to do it.

Mr. MILLER. I understand all that, and I have had it deeply impressed here that in your relations with the United States Government you so entwined the Government's investment with your own investment and laced backward and forward until ultimately there would be no human being that could purchase or come in competition with you for the purchase of the Government's rights in that property.

Mr. MARTIN. Mr. Miller, I do not accept your premise. The Alabama Power Co. did not interlace anything. This contract was made by Government officials with us on a fair basis, and it was understood from first to last that this property was to be developed and constructed just as it was to accomplish the Government's purposes, namely, the sale and delivery of energy.

Mr. MILLER. I understand; but there are different ways of accomplishing the same result. Now, you take issue with me, let us refer to subdivision 5, of article 22, on page 157, part 3, of the hearings:

"In the event that the contractor [that is you] shall on demand of the United States fail or refuse to purchase the Warrior Extension and Warrior substation under any of the foregoing subdivisions of this article, the United States may sell the same to another, subject to the conditions that said properties shall not be operated and that they shall be removed within six months after the sale has been consummated. Upon the consummation of such a sale with another purchaser, the United States shall pay over to the contractor the whole of said accumulated fund [that is, this 2 mills fund we were talking about a moment ago] less the amount, if any, by which the actual cost of the said properties shall exceed the price realized from such sale."

Mr. MARTIN. Yes, sir.

Mr. MILLER. Now, we have got a \$5,000,000 investment down there, and we have got it so interlaced and stitched up with the Alabama Power Co. that if the United States should want to sell it, it could only sell it to some person who could not operate it, and still you say that you want to buy it as a going concern, but no other human being could possibly buy it on the basis of a going concern. That gives the Alabama Power Co. a wonderful advantage, does it not, over any possible competitor?

Mr. MARTIN. The very inception of this whole arrangement looked to the thing which is done now. The United States Government appreciated that this extension could only be made in the manner in which it was made, and we obligated ourselves to buy it at a fair value in order to protect the Government in the situation of which you speak.

Mr. MILLER. And in buying it at a fair value you absolutely bar any competitor.

Mr. MARTIN. We could not afford to have our plant segregated into two parts. We could not afford to turn our plant over. That was the fundamental basis of this whole arrangement.

Mr. MILLER. You are not transferring any plant. You turn over the output of a part of your plant, but you did not turn over any plant to the United States?

Mr. MARTIN. That is exactly what we could not do.

Mr. MILLER. But the Government turned over a plant to you which bears a relation to your investment of 5 to 4, the Government being the major holder of interest there.

Mr. MARTIN. The Government advanced funds for the extension of property, and we agreed to buy that property on the basis of fair value.

Mr. MILLER. And the Government advanced an amount one-fourth more than you have put in there, but still this thing is so interwoven that when the time comes when the war shall be over and the Government shall desire to dispose of it, which time is now.

Mr. MARTIN. Yes.

Mr. MILLER. The only possible people that the Government can deal with will be the Alabama Power Co.; is not that true?

Mr. MARTIN. That is correct, Mr. Miller, and that was contemplated, and the contract from beginning to end contemplated that, and there is no other way by which this extension could have been worked out.

Mr. MILLER. I see very plainly what the contract is, but I have been wondering if there is any other human being that would put a dollar into an enterprise on such a basis as the United States Government put its money in with you. Can you conceive of any institution in the world, or can you conceive of the United States, except in the extremity of war, making such a contract?

Mr. MARTIN. This was the extremity of war, Mr. Miller.

Mr. MILLER. And I am afraid, Mr. Martin, that I am forced to believe that you took advantage of the Government in its extremity of war.

Mr. MARTIN. We resent the insinuation, sir. We did not. We made a fair, decent, honorable contract with the United States Government.

Mr. MILLER. I have the right to my interpretation, I think, Mr. Martin.

Mr. MARTIN. And I have the right to mine, too.

Mr. MILLER. And I have the right to express my opinion.

Mr. MARTIN. And I have the right to express my opinion, and I will.

Mr. MILLER. And I say, sir, that it looks to me as if the Alabama Power Co. had ingeniously interwoven the Government's interest along with yours to such an extent that they never could be segregated and that you would be the only man that could become the purchaser.

Mr. MARTIN. And I resent the insinuation.

Mr. MILLER. You can resent it all you please, Mr. Martin.

Mr. MARTIN. Yes.

The CHAIRMAN. The gentlemen will please observe order. We are getting along very nicely here, and there is no use losing your tempers.

Mr. MARTIN. The Government could have gone and built a plant. The Government came to us. The Government officials recognized the situation and wanted power, and this was the way that the Government officials had of getting power.

Mr. MILLER. It is plain that they got the power and I see the end of the horn the Government is coming out in this thing, too, notwithstanding the great patriotism that you suggested to the committee this morning, Mr. Martin.

Mr. MARTIN. Has any representative of the Government in the Ordnance Department questioned the fairness of this contract—Gen. Williams or Col. Burns?

Mr. MILLER. We will take that up—

Mr. MARTIN. And those men who made this contract?

Mr. MILLER (continuing). When we come to it.

Mr. MARTIN. They know it is a fair contract.

Mr. MILLER. You say it is a fair contract.

Mr. MARTIN. Yes, sir.

Mr. MILLER. In opposition to that, Mr. Martin, I would say that it is the most unconscionable contract I ever saw signed by people.

Mr. MARTIN. We nevertheless have our opinion.

Mr. MILLER. Now, that is your view and my view.

Mr. MARTIN. Yes, sir.

Mr. MILLER. I have no hesitation about accepting your view and you should have none in accepting my view.

Mr. MARTIN. I do not accept your view.

Mr. MILLER. And I dare say, from my reading of this contract, the Government was simply overreached under the terms of this contract or else it was taken advantage of by the exigencies of war.

Mr. MARTIN. Neither of which was the case.

Mr. MILLER. Let us now go on a little further. I am referring now to paragraph 6.

"In the event that (a) the Warrior extension and Warrior substation are not sold in the manner herein provided to the contractor or to another within the period of 10 years, referred to in article 15, or (b) said properties not having been so sold, the United States or its said successor shall cease for 365 consecutive days to take any energy from the Warrior extension; the United States shall, upon six months' notice in writing from the contractor, remove the Warrior extension and Warrior substation from the lands of the contractor unless it shall, within 90 days after receipt of such notice, proceed to exercise its option under subdivision 1 on this article."

Now, there is another contingency. If somebody should come along and should be induced to buy the United States' interest in it he could not operate the plant, and if the United States should hold it and not sell it, it must remove the plant from your property, in which case you get the benefit, likewise, of this two-mills fund.

Mr. MARTIN. There is not a cent in that accumulated fund.

Mr. MILLER. I understand there is no accumulated fund now.

Mr. MARTIN. And never was.

Mr. MILLER. But suppose the war had continued, as you were preparing for in this contract, evidently, and a great deal of your energy had been absorbed, there would be considerable in this accumulated fund, would there not?

Mr. MARTIN. That is possible.

Mr. MILLER. Yes. Now, then, let us take the power extension and transmission line. The Alabama Power Co. built those, did they, on your land?

Mr. MARTIN. Yes, sir.

Mr. MILLER. Did you own the land prior to the time the United States Government got into relations with you?

Mr. MARTIN. We had owned the right of way to a point beyond Jasper, about 20 miles.

Mr. MILLER. Then between Jasper northward, for approximately 68 miles—

Mr. MARTIN. Something like that.

Mr. MILLER (continuing). You acquired the right of way?

Mr. MARTIN. We did.

Mr. MILLER. Why did not the United States acquire that right of way itself?

Mr. MARTIN. The United States requested us to acquire and pay for it.

Mr. MILLER. And then why did you not acquire it for the United States?

Mr. MARTIN. We were requested to acquire it and take the title in our name.

Mr. MILLER. Who made that request?

Mr. MARTIN. Col. Joyes.

Mr. MILLER. Col. Joyes did not deem it worth while for the United States to have anything down there in its own name, but everything on the property of the Alabama Power Co.; every dollar of this \$4,800,000 investment. That is right, is it not?

Mr. MARTIN. That is your interpretation of it.

Mr. MILLER. I am asking you if it is not your interpretation?

Mr. MARTIN. I did not get your question.

(The stenographer read the question referred to.)

Mr. MARTIN. Col. Joyes considered that the interest of the United States was protected when the contract required us to buy the property at fair value.

Mr. MILLER. I will ask you this question: As a matter of fact, every dollar of the \$4,878,000 that the Government has put in there, in connection with the Warrior Steam Plant and the transmission line, is on the property of the Alabama Power Co.?

Mr. MARTIN. It is.

Mr. MILLER. Then we have this condition: We have an investment there which is heavier than yours, bearing the relation of five to four, and that is on your property, and we can not sell it to a purchaser who can operate it, and if we do not sell it to you, and the Government keeps it, it has got to take it off of your land. That is the condition of the United States Government, is it not?

Mr. MARTIN. But the Government is protected because it can require us to buy at a fair value, and that was contemplated from the first, that we would stand ready to buy at a fair value.

Mr. MILLER. And the whole thing was so shaped, was it not, Mr. Martin, let us be frank, that when the Government was through using it, there could be nobody that could take over that property but the Alabama Power Co.?

Mr. MARTIN. At a fair value.

Mr. MILLER. At a fair value?

Mr. MARTIN. Yes, sir.

Mr. MILLER. Now, if you were after fair value, why was the wording of this contract so twisted around that nobody could compete against you?

Mr. MARTIN. In the first place, we had the Warrior Station and it was an integral part of our hydroelectric system. If that station was to be extended and we were to obligate ourselves to deliver power from it, and if we were to undertake to extend it for the account of the Government, we could not undertake that if the extension should be separated into another plant. The Government might take the whole plant. It might have taken it all, of course, but if the Government undertook to take it all there were other obligations and conditions which would arise by reason of that. The Government did not undertake to do that. It was not necessary for the Government to take

the station. We could not part with a part of the station. It would disarrange our whole hydroelectric system.

Mr. MILLER. It would disarrange your whole system?

Mr. MARTIN. It would disarrange our whole system because our water-power system must have a steam reserve. This plant was built for that steam reserve. We had many contracts to sell power based on our ability to deliver power throughout the year, this plant supplying the deficiency.

Mr. MILLER. Mr. Martin, we are very familiar with the principle of steam-reserve plants.

Mr. MARTIN. And that accounts for the fact that we could not undertake to separate this property into two stations. It could not be operated as two stations.

Mr. MILLER. The plant was so constructed there, physically, that it could not be separated from your plant.

Mr. MARTIN. It could not be, because the very location of it is such that it can not be separated. There is not physically enough space or square feet of acreage to permit of two plants being operated there. There is not sufficient cooling water. That was a part of the whole situation which the Government officials recognized.

Mr. MILLER. If the war had run along a sufficient amount of time, Mr. Martin, for this accumulated fund to have reached the value of the plant, you say you would have taken over the entire plant and have paid the United States the value of it; is that right?

Mr. MARTIN. If we had paid the United States Government the cost of the property, we would have taken the title to it.

Mr. MILLER. I will ask the reporter to read the question and answer.

(The reporter read the question and answer referred to.)

Mr. MARTIN. My answer is right.

Mr. MILLER. But if the war did not run along long enough for this accumulated fund to amount to anywhere sufficient to meet the cost of the plant, the plant then was to be in such a position that it could not be sold to anybody in the world except you?

Mr. MARTIN. At a fair value.

Mr. PARKER. Mr. Martin, you have stated that this contract was not signed until November, 1918.

Mr. MARTIN. Yes, sir.

Mr. PARKER. Col. Hull, on page 129, calls it a contract of December 1, 1917, and refers to previous statutes. He was asked when that contract was made and answered that it was dated December 1, 1917, and seems not to have understood that it was made in November, 1918. It is a matter of some importance. Have you any correspondence or written statements which show when the contract was really executed?

Mr. MARTIN. We have.

Mr. PARKER. There was no acknowledgment?

Mr. MARTIN. We have, Mr. Parker. I have before me the minutes of the board of directors of the Alabama Power Co. of November 4, 1918, which I will give you.

Mr. PARKER. That is already in the record, on page 168, or the motion authorizing the execution of the contract. There may be something else in the minutes.

Mr. MARTIN. Yes; there is something else in the minutes which I want to read to you. At this meeting of the board of directors, held November 4, 1918, the minutes recite:

"The Chairman then explained the proposed agreement with the United States for the construction of the Warrior extension and transmission line to Sheffield, dated December 1, 1917, and after full discussion of the subject it was, on motion, resolved that the president and vice president, or either of them, is separately authorized to sign and execute on behalf of this company any and all proposals which may be submitted, any contracts, bonds, or other documents relative to any work which is or may be awarded by the United States Government to this company, and also any contracts and bonds with the Government concerning such work."

There is a certified copy of this resolution attached to the contract itself.

Mr. PARKER. A copy of the resolution but not of the recital.

Mr. MARTIN. Yes; not of the recital.

Mr. PARKER. Have you any correspondence which shows that the Ordnance Department at that time asked you to attend to the execution of that contract.

Mr. MARTIN. As late as November?

Mr. PARKER. In November; yes.

Mr. MARTIN. I think we have. I have letters to and from Col. Williams.

Mr. PARKER. They are not here, are they?

Mr. MARTIN. My associate has just handed me one letter.

The CHAIRMAN. This morning, I think, you stated that you had correspondence regarding this matter prior to the time when the formal contract was ratified, and that you agreed to put into the hearings those letters, as I recall.

Mr. PARKER. What does this letter say.

Mr. MARTIN. It is just a letter under date of October 19, 1918, to me from Col. Williams transmitting to me certain articles of the contract which he has rewritten, from articles 1 to 21, with the exception of article 15. He transmits them under date of October 19, 1918. Col. Beames, a witness to the contract, is available and various other witnesses are available. I was present myself when the contract was executed, and both witnesses to the contract can be very readily had. I have here another letter from Col. Williams, dated November 1, 1918, addressed to me at our New York office relative to the contract, sending certain pages of the rewritten contract. It is dated November 1, 1918.

The CHAIRMAN. But, Col. Williams, you said, has gone to Japan.

Mr. MARTIN. Yes.

The CHAIRMAN. So, he is not available to be called before the committee.

Mr. MARTIN. No, sir.

The CHAIRMAN. Could Col. Beames be called?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. I think you gave us his address when you testified this morning?

Mr. MARTIN. Yes, sir.

Mr. PARKER. Now, Mr. Martin, you have stated something about the price of water power in Alabama as given from a report of the Department of Commerce as being in 1917, 2 cents; and in 1912, 1.9 cents per kilowatt; and in 1917, 7 mills per kilowatt. What was it in 1918 or does not that appear?

Mr. MARTIN. That does not appear from the tabulation I have here, Mr. Parker.

Mr. PARKER. It is important to know what a fair price was and I want to know what you were selling power in large quantities for in 1916, 1917, and 1918?

Mr. MARTIN. The average price was between 8 and 9 mills per kilowatt-hour.

Mr. PARKER. To everybody except the Government?

Mr. MARTIN. Yes.

Mr. PARKER. In large quantities?

Mr. MARTIN. Yes; that was the average return we received over our entire system, approximately 8 mills.

Mr. PARKER. What was the lowest you sold power for to any large customer outside of the United States?

Mr. MARTIN. I would have to look that up to see, Mr. Parker.

Mr. PARKER. I wish you would look that up and put in the record all your sales in large quantities. I do not care about any of your small sales to small factories, but this contemplated a very large number of kilowatts.

Mr. MARTIN. Yes; it contemplated the sale of power which we were unable to make from our water-power system without steam addition.

Rates charged by Alabama Power Co. for hydroelectric power supplied to large consumers with service requirements comparable to those of the United States Government at nitrate plant No. 2, (rates are based on hydroelectric and not steam-generated power).

1917, 1918, AND 1919.

- (1) 7,500 kilowatts, 50,000,000 kilowatt-hours per year, 6.32 mills per kilowatt-hour;
- (2) 15,000 kilowatts, 100,000,000 kilowatt-hours per year, 6.27 mills per kilowatt-hour;
- (3) 30,000 kilowatts, 200,000,000 kilowatt-hours per year, 6.26 mills per kilowatt-hour;

1920 AND 1921.

- (1) 7,500 kilowatts, 50,000,000 kilowatt-hours per year, 7.24 mills per kilowatt-hour;
- (2) 15,000 kilowatts, 100,000,000 kilowatt-hours per year, 7.04 mills per kilowatt-hour.
- (3) 30,000 kilowatts, 200,000,000 kilowatt-hours per year, 6.92 mills per kilowatt-hour.

Mr. PARKER. Very true; but I want to know what was a fair price at that time, and you can give us that with all the remarks you choose to make about it. Did it sell in 1919 at a lower or higher rate?

Mr. MARTIN. Our average return?

Mr. PARKER. Yes.

Mr. MARTIN. It was slightly above. It went probably a little more than 8 mills, but was still between 8 and 9 mills.

Mr. PARKER. What was it in 1920?

Mr. MARTIN. There was practically no change.

Mr. PARKER. What is it now?

Mr. MARTIN. It is practically the same. There is very little change.

Mr. PARKER. The price you named to the Government was $6\frac{1}{2}$ mills, was it?

Mr. MARTIN. Yes.

Mr. PARKER. Was that price higher or lower than the price you get from other customers who buy in large quantities?

Mr. MARTIN. Considering the fact that it was based on steam, it was lower.

Mr. PARKER. If it was based on water power, how is it in comparison with what you sold power for to other people?

Mr. MARTIN. Our commercial manager tells me there would be very little difference. It would work out between 6 and $6\frac{1}{2}$ mills. It might have worked out a little less than $6\frac{1}{2}$ mills.

Mr. PARKER. You mean in sales to other people?

Mr. MARTIN. You asked me the question whether this quantity of power if sold at our standard rate would be less than $6\frac{1}{2}$ mills. Based on our water-power system it might have been a little less than $6\frac{1}{2}$ mills. I will have to work that out and see.

Mr. PARKER. For the whole year?

Mr. MARTIN. Yes; but would not have been less than 6 mills.

Mr. PARKER. And what was the price of your steam power?

Mr. MARTIN. We had no other contract with anyone based on the delivery of steam power.

Mr. PARKER. And steam power is more or less expensive than water power?

Mr. MARTIN. It is more expensive. We could not deliver steam power at $6\frac{1}{2}$ mills except on a very high load factor.

Mr. PARKER. I understand that the tract of land on which the power plant was erected belonged to you.

Mr. MARTIN. It did.

Mr. PARKER. When did you buy it?

Mr. MARTIN. Either in 1915 or 1916, before we began the erection of our plant.

Mr. PARKER. Do I understand your position correctly to be that you considered the money spent by the Government as advanced to put the plant and lines upon your property which should become yours, if you wished it, and which should be paid for, not at the cost of construction, but at a fair price as a working plant according to its value, when you finally took it over, and with a provision that meanwhile, while the Government got the benefit of the plant and paid for power, they should pay $6\frac{1}{2}$ mills a kilowatt, but deduct 2 mills a kilowatt, and you should pay 6 per cent interest on the cost of the whole plant?

Mr. MARTIN. Yes, sir.

Mr. PARKER. That proposition is a little troublesome, because I understand you do not pay interest at all except when the Government takes power from you.

Mr. MARTIN. If the Government does not take power from us we pay in the form of a mill and a half a kilowatt hour, generated at the station.

Mr. PARKER. That is in the contract?

Mr. MARTIN. Yes, sir.

Mr. PARKER. That is to say, if they do not take from you and you use the plant, you pay $1\frac{1}{2}$ mills per kilowatt hour, you furnishing the expense?

Mr. MARTIN. The thought being that the mill and a half amounts to 6 per cent interest on the investment.

Mr. PARKER. Is that what you are paying now?

Mr. MARTIN. Yes.

Mr. PARKER. Then the payments you are making now are under the same original contract?

Mr. MARTIN. Yes, sir.

Mr. PARKER. What clause is that?

Mr. MARTIN. That is subdivision 2 of article XVII.

Mr. PARKER. Are you using the plant to its full capacity?

Mr. MARTIN. We are at times.

Mr. PARKER. When you are short of water?

Mr. MARTIN. Yes; that is right.

Mr. PARKER. How will a temporary use of that sort amount to anything like 6 per cent interest?

Mr. MARTIN. How would it amount to that?

Mr. PARKER. Yes; a temporary use of that sort. How much did you pay for the use last year?

Mr. MARTIN. During the year 1921 we paid the Government \$77,211.61.

Mr. PARKER. That is the interest at 6 per cent on a million and a quarter?

Mr. MARTIN. That does not quite equal 6 per cent.

Mr. CROWTHER. During some of the evidence given this morning a condition arose which was rather regretful, to my mind, inasmuch as it gives a very faint suggestion of some collusion. I want to know whether anything like that existed. During the long period that elapsed between the writing of this contract and the final signing of it, was the legislation you quoted, which was passed in the meantime, for the purpose of validating that contract because previous legislation did not, apparently, measure up to the necessity?

Mr. MARTIN. I knew nothing about the legislation, either that it was pending or passed, until after it passed.

Mr. CROWTHER. It was true that during that period two other acts were passed, between the original writing of the contract and the final signing of the contract?

Mr. MARTIN. Yes, sir.

Mr. CROWTHER. What was the necessity of hurrying it up and then coming in and getting the contract signed?

Mr. MARTIN. It just happened that the contract was ready for execution that day.

Mr. CROWTHER. It was just a coincidence?

Mr. MARTIN. It just happened so; it was a coincidence.

Mr. CROWTHER. Do you know anything about Col. William Williams? What I mean is, is he a New Yorker, is he not? Has he been connected with this New York firm of lawyers for a very long time?

Mr. MARTIN. He is a lawyer of distinction at the bar of New York and has practiced there for 30 years.

Mr. CROWTHER. In New York?

Mr. MARTIN. In New York; yes. He told me of his experience as counsel for the United States in the Behring Strait controversy with Great Britain many years ago. He has had appointments as counsel in many matters of importance that he mentioned to me. I do not recall that I ever had any relations with him before, and I have not had any since.

Mr. CROWTHER. Do you think the contract would be as binding and would be sound if the legislation that you quoted to-day had not been enacted?

Mr. MARTIN. It would have been binding on us to buy.

Mr. PARKER. Would it have granted the privilege to the Government or its officers to sell?

Mr. MARTIN. To agree to sell?

Mr. CROWTHER. Yes.

Mr. MARTIN. I do not think it would.

Mr. CROWTHER. Not until legislation was passed?

Mr. MARTIN. That is correct.

Mr. HILL. Mr. Martin, Mr. Henry Ford has submitted to this committee a proposition for the acquisition of the Muscle Shoals property. The Alabama Power Co., of which you are president, has submitted another proposition dealing with the disposition of the Muscle Shoals property. The questions I propose to ask you and the line of inquiry I am interested in at the present

moment have nothing at all to do with the war activities of the Alabama Power Co. or of Mr. Henry Ford, nor have they anything to do with anything except the bare terms of the contracts or the offers—two separate offers—as they are now placed before this committee.

The CHAIRMAN. At this time the committee decided to take up the objection that the Alabama Power Co. has to the acquisition of nitrate plant No. 2 and the transmission line, the Waco quarry, etc., by Mr. Ford. This morning I suggested—I do not think you were present—

Mr. HILL. I was not present.

The CHAIRMAN. The matter of the Alabama Power Co. will be taken up when the Alabama Power Co. has answered the Ford proposition.

Mr. HILL. Then it is not intended this afternoon that the committee should take up the merits of the Alabama Power Co.'s proposition as bearing on the merits of the Ford proposition?

The CHAIRMAN. No.

Mr. HILL. Then I have not any questions at all to ask to-day.

Mr. WURZBACH. When and how long was Mr. Washburn president of your company?

Mr. MARTIN. He became president of our company some time in 1913; that is my recollection. He continued as president until the annual meeting of our directors in February, 1915. He was president two years.

Mr. WURZBACH. Was he connected with the company in any other official capacity before 1913 or after 1915?

Mr. MARTIN. Yes; he became director and president in 1913, and, as I say, he resigned as president in the early part of 1915, but continued as a director until he resigned in the early part of 1916.

Mr. WURZBACH. Since that time he has had no official connection with your company?

Mr. MARTIN. Not as a director or in any capacity with our company.

Mr. WURZBACH. Is Mr. Duke a stockholder of your company?

Mr. MARTIN. No.

Mr. WURZBACH. Has he ever been?

Mr. MARTIN. He never has been.

Mr. WURZBACH. You stated that the Alabama Power Co. under the contract made with the Government acquired the easements and right of way for about 67 miles of the transmission line; is that correct?

Mr. MARTIN. Yes.

Mr. WURZBACH. What does your company pay for those rights?

Mr. MARTIN. Those rights of way would cost us, including investigation of titles, etc., something like \$400 or \$500 a mile. They would run between \$400 and \$500 a mile.

Mr. WURZBACH. That would be how much?

Mr. MARTIN. For the whole distance?

Mr. WURZBACH. No; just the rights you acquired.

Mr. MARTIN. After the Government began?

Mr. WURZBACH. Yes.

Mr. MARTIN. Somewhere between \$40,000 and \$50,000 would easily cover it.

Mr. WURZBACH. You stated that your company had planned to put in a second unit at Gorgas and had placed orders for that purpose. Why did not your company offer to put in this unit instead of requiring the Government to do it and pay your company a fee?

Mr. MARTIN. Because, in the first place, the unit was not of the capacity the Government wanted. It was only a 20,000-kilowatt unit. In the second place, it was a question of financing; at that time we could not finance it except on Government credit or Government aid. We applied to the War Credits Board, through Col. Jones, for some financing to aid us in going ahead on our own account, which we were unable to get.

Mr. WURZBACH. You do not think you could have done that work at your own expense, with your own financing?

Mr. MARTIN. Not under those conditions.

Mr. WURZBACH. Could you have done it up to the present time?

Mr. MARTIN. Yes; we could have done it.

Mr. WURZBACH. Does your company own any land at the site of the proposed Dam No. 3?

Mr. MARTIN. It does. Our company owns the abutment sites at that dam and some flowage lands.

Mr. WURZBACH. In case of the acceptance of the Ford offer you would be required to convey your holdings to the Government in order for the Government to give good title?

Mr. MARTIN. I assume the Government would undertake to acquire the property in some form.

Mr. WURZBACH. About what is the value of your holdings there?

Mr. MARTIN. I have not expressed any opinion as to the value, Mr. Wurzbach. I would not really like to do that.

Mr. WURZBACH. I think at this point, Mr. Martin, I want to ask you whether your engineers or your directors had in mind a fair value of the property involved in this contract under section 22. I think that is the provision under which you claim an option to purchase from the Government?

Mr. MARTIN. Yes, sir.

Mr. WURZBACH. What is that amount?

Mr. MARTIN. As to what a fair value is?

Mr. WURZBACH. Has your company in mind any amount?

Mr. MARTIN. No; we have not fixed upon any amount. That is subject to arbitration.

Mr. WURZBACH. I understand that; but I suppose you and the members of your company, your officers, have thought about what a fair value for the property would be; have you not?

Mr. MARTIN. Yes; very naturally we have, Mr. Wurzbach.

Mr. WURZBACH. Would you mind stating what amount you had in mind as a fair value for that property?

Mr. MARTIN. Now, you see that question is one which would have to come before the board of arbitration, and very naturally I would hesitate to go into the question now because it is a matter which would naturally come before that board, and I would not care to express an opinion about it now.

Mr. WURZBACH. How does the cost of reproduction at this present time compare with the cost at the time of the construction of this work?

Mr. MARTIN. The cost of reproduction now, our chief engineer tells me, is about 70 per cent of the cost at that period.

Mr. WURZBACH. Seventy per cent of the cost of construction in 1918—I think that is when it was constructed.

Mr. MARTIN. In 1918; yes.

Mr. WURZBACH. After deducting your fee, or the fee that your company received, what would be a fair value, in your opinion?

Mr. MARTIN. I would not like to express an opinion on that. That is a conclusion.

Mr. WURZBACH. Is not that the only fair value that the Government could get for this property, there being no other possible competitors for this particular property?

Mr. MARTIN. Taking into account all the elements which make up fair value, its cost of reproduction is one, and then you would have to consider the question of maintenance and depreciation, and life, etc. All these elements enter into it. Of course, the original cost is one of the elements to be taken into account, and you will see a provision in the contract which requires us to buy it at a fair value.

Mr. WURZBACH. And the production cost was about \$5,000,000?

Mr. MARTIN. Yes.

Mr. WURZBACH. Under this contract you would be forced to pay the price that the arbitrators agree upon?

Mr. MARTIN. We would; that is our interpretation of the contract.

Mr. WURZBACH. You conveyed some rights you had at the site of Dam No. 2 to the Government?

Mr. MARTIN. We did.

Mr. WURZBACH. What was the date of that conveyance?

Mr. MARTIN. The date of our letter to the Secretary of War was in February, 1918. We tendered a conveyance to the Secretary of War or the Chief of Engineers, and possibly in a letter we were asked to make some changes in that, and we did make changes in it, and the deed was finally delivered, as I recall, some time in 1920. I have not the exact date before me, but I can get it for you.

Mr. WURZBACH. Have you a copy of the deed?

Mr. MARTIN. I think I have it in town; I have not got it here.

Mr. WURZBACH. About how many acres did that involve?

Mr. MARTIN. I do not recall; I would have to look it up.

Mr. WURZBACH. Was it an absolute deed, with no conditions attached to it?

Mr. MARTIN. No conditions attached to it.

Mr. WURZBACH. Mr. Martin, this contract that is dated December 1, 1917, was, in fact, not signed until November 4, 1918.

Mr. MARTIN. In November, 1918.

Mr. WURZBACH. As a lawyer, what would you consider the true date of that contract?

Mr. MARTIN. The actual date of its execution by the parties.

Mr. WURZBACH. The date of execution and delivery?

Mr. MARTIN. Yes.

Mr. WURZBACH. Most of the obligations, in fact all the obligations involving the construction work, the performance of the work, the actual performance of the contract, except the option, had already been performed by that time?

Mr. MARTIN. Yes; they had practically been performed.

Mr. WURZBACH. Did you draw the contract?

Mr. MARTIN. No; I did not. It is Col. Williams's theory of the contract. Col. Williams redrafted the entire contract when he got into it.

Mr. WURZBACH. You got together and discussed the contract prior to December 1, 1917?

Mr. MARTIN. Yes.

Mr. WURZBACH. I suppose you had duplicate drafts of that contract?

Mr. MARTIN. Yes—prior to its execution?

Mr. WURZBACH. Prior to its execution.

Mr. MARTIN. Yes; there were numerous drafts of it.

Mr. WURZBACH. Have you any of those original drafts?

Mr. MARTIN. We have some of them. I do not know whether they are here or not. I do not think they are in Washington.

Mr. WURZBACH. Would you mind incorporating one of those in the record?

Mr. MARTIN. Yes; I would be glad to do that.

Mr. WURZBACH. Were there any material changes made in that contract between December 1, 1917, and November 4, 1918, when it was actually signed?

Mr. MARTIN. The contract as it was signed was materially different from the contract, naturally, which would have been signed on the 1st of December, 1917, if I get your point. There was no completed contract drafted in 1917. The first time there was any completed contract drafted was some time in 1918.

Mr. WURZBACH. On November 4?

Mr. MARTIN. No. There were drafts of the contract prior to November 4 at different times. You asked me if there were any changes between those dates—that is, between December 1, 1917, and the final draft. I would have to look at the draft to see.

Mr. WURZBACH. You had a draft of the contract on December 1, 1917, did you not?

Mr. MARTIN. No, sir.

Mr. WURZBACH. Then why did you date this contract December 1, 1917, instead of November 4, 1918, when it was actually signed and delivered?

Mr. MARTIN. We began the negotiations with Col. Joyes in November, and all the drafts bore the date of December 1. No one ever thought about changing them; we began the work in December. It never occurred to me but that the principle of law that applied would be that the true date of the execution of the contract would always be proven, and I never questioned the matter of dating the contract at all. This question as to when the contract was executed was never discussed in so far as dating it was concerned. So far as the legal effect is concerned, of course, we executed the contract in the light of the law as it existed, but none of us thought to date the contract without reference to the law as it then existed.

Mr. WURZBACH. You had negotiations with the attorney for the Government before December 1, 1918?

Mr. MARTIN. Oh, yes; frequently.

Mr. WURZBACH. And you drew up some kind of a draft of a contract?

Mr. MARTIN. Yes.

Mr. WURZBACH. On December 1, 1917?

Mr. MARTIN. No; there was no contract drawn in 1917.

Mr. WURZBACH. I thought you said you did have?

Mr. MARTIN. You said 1918.

Mr. WURZBACH. I mean December 1, 1917. That is the date of the contract in the record now?

Mr. MARTIN. Yes.

Mr. WURZBACH. That is the date it bears?

Mr. MARTIN. That is the date it bears.

Mr. WURZBACH. Although it was signed on November 4, 1918?

Mr. MARTIN. On November 9, 1918.

Mr. WURZBACH. When was the contract actually signed?

Mr. MARTIN. On November 9, 1918.

Mr. WURZBACH. And the contract that was signed on November 9, 1918, is dated December 1, 1917?

Mr. MARTIN. That is correct; yes.

Mr. WURZBACH. And you did have some form of a contract prepared about December 1, 1917?

Mr. MARTIN. No, sir; there was no contract prepared then.

Mr. WURZBACH. When did you first prepare a draft of a contract?

Mr. MARTIN. Some time in 1918, Mr. Wurzbach; I could not tell you when. I might be able to tell you by looking at my records.

Mr. WURZBACH. Is that this particular contract that was signed on November 9, 1918, that you say was prepared some time—you thought in August, 1918?

Mr. MARTIN. I wonder if we are speaking about the same thing. There were various drafts of this contract, beginning in the early part of 1918, at different times, with Capt. Noble, the first law officer of the Government. He died and his work was taken up by Col. Williams. Col. Williams changed the entire theory of the contract. It was first drafted in two or three parts, according to my recollection, separate and distinct contracts. Col. Williams changed it to one contract and drafted it entirely over after Capt. Noble died. So there were drafts and drafts of the contract. Those negotiations proceeded until the final form of the contract was agreed upon in November, 1918.

Mr. WURZBACH. At that time, during the year 1918, you were living in Birmingham, Ala.?

Mr. MARTIN. Yes.

Mr. WURZBACH. And Col. Williams was in New York?

Mr. MARTIN. He was in Washington most of the time.

Mr. WURZBACH. I suppose you had considerable correspondence with reference to this contract and as to how it should be drawn and the terms which it should contain?

Mr. MARTIN. Yes.

Mr. WURZBACH. Would you have any objection to furnishing this committee with that correspondence in connection with that contract and place that in the record?

Mr. MARTIN. I shall be glad to do it.

Mr. FIELDS. Mr. Martin, on what date did Mr. Washburn resign his position as director of the Alabama Power Co.?

Mr. MARTIN. In March, 1916.

Mr. FIELDS. You have stated that prior to your entering into this contract with the Government you owned part of the right of way of the transmission line between the Gorgas plant and nitrate plant No. 2. How long before you entered into your contract, Mr. Martin, did you acquire the title to the land on the transmission line?

Mr. MARTIN. Probably from one to two years before. We owned a distribution system in the city of Jasper. We had service to cities, towns, and coal mines and other enterprises, and we had constructed service lines from the Gorgas plant location to those communities, and this right of way was acquired on which to construct those lines. I would have to look up the records to give you a more exact date.

Mr. FIELDS. You have stated that your first contract, written or oral, with the Government for the extension of this plant was about December 1, 1917?

Mr. MARTIN. In December, 1917. There was no written contract.

Mr. FIELDS. I said written or oral, whichever it was.

Mr. MARTIN. It was merely a verbal authorization to build the transmission line as quickly as we could, and on that verbal authority we began the work.

Mr. FIELDS. I suppose you had a good many letters which passed between the Alabama Power Co. and the agents of the Government?

Mr. MARTIN. Yes.

Mr. FIELDS. Which contained provisions of the proposed contract. You evidently had something to start your operations on?

Mr. MARTIN. Yes; we had work orders, and I am going to put those in the record at the request of the chairman.

Mr. FIELDS. How far had you progressed with that work about May 1, 1916, about the time this statute was enacted?

Mr. MARTIN. The transmission line was erected and in operation.

Mr. FIELDS. How far had you progressed with the construction of the addition to that plant?

Mr. MARTIN. The plant was being erected, the apparatus was contracted for, and the steel was being erected, so my chief engineer says.

Mr. FIELDS. I believe you have stated that because of the nature of this construction it would be impossible to unscramble, so to speak, the interests of the Government and the interests of the Alabama Power Co. in this property owned jointly by them. If I remember correctly, one engineer before the committee has stated that it could be unscrambled. Will you explain for the benefit of the committee just why it could not be separated?

Mr. MARTIN. It can be separated in the sense that it can be removed. It can not be separated in the sense that it can remain and form a distinct and separate operation.

Mr. FIELDS. That is the point I wanted you to explain.

Mr. MARTIN. Did you see the pictures of the plant this morning?

Mr. FIELDS. Yes.

Mr. MARTIN. The site is located at the junction of Bakers Creek and the Warrior River. The Alabama Power Co. owns a small acreage at that site in fee simple. Immediately adjoining is the land of a coal company, in which the power company owns the surface interests.

Then we have one water intake, having in view when we constructed the plant that we would, of course, own the plant site. We had no purpose in making two intakes, so we have one intake for the water and one discharge tunnel. The water comes into one tunnel into the power house and serves the needs of the generator we had installed, and then serves the needs, as it passes through the same tunnel, of the other unit. We have coal-handling devices coming from the same common source, and we have ash-handling facilities from the same source. We have one common substation, and the switching apparatus is on one switchboard. The housing facilities are, of course, located in a village. There is no separation; the water employed operates on one side of the plant or on another. We have a small village of houses for the operatives. With the limited acreage, the boiler facilities, the cooling water, and other facilities are so constructed there as to constitute one plant. It was simply made as an extension of an existing, going plant. You can not have two operations in an area so restricted. The question of conflicts will inevitably arise as respects cooling water, as affect the use and handling of those things which come within a closely circumscribed area.

Mr. FIELDS. It would have been possible, would it not, in the construction of the plant to have constructed it so it could have been separated had the Government desired to separate it?

Mr. MARTIN. Not at that location; it could not have been constructed differently at that location.

Mr. FIELDS. I believe you stated that you were ready to furnish the Government power there some five months before the completion of the steam plant at nitrate plant No. 2?

Mr. MARTIN. Some months before.

Mr. FIELDS. Did your company, in its desire to help the Government, propose at any time to construct the steam plant at nitrate plant No. 2 instead of extending your own plant?

Mr. MARTIN. We had nothing to do with nitrate plant No. 2.

Mr. FIELDS. You did not tender your services for the construction of that plant instead of the extension of your plant?

Mr. MARTIN. We had nothing to do with that work.

Mr. FIELDS. Do you not believe that your company, with its intimate knowledge of this character of construction, might have constructed the steam plant at nitrate plant No. 2 with greater speed than it was constructed.

Mr. MARTIN. I would not like to pass on that question. The contract was in the hands of the J. G. White Co. They were among the best engineers in this country, and they had a difficult problem there. They had to begin from the foundation up and create a situation. We had six months' start in the fact that we had water intakes, had the foundations, had a village, had power lines, and everything ready to immediately start construction at Warrior.

Mr. FIELDS. This was the thought that struck me this morning when you were discussing that subject, that with the country at war, and this power

available 88 miles away, which required not only the addition to your own plant but the construction of a transmission line, it seems to me a little strange that your company did not first suggest the construction of a steam plant at nitrate plant No. 2. It seems that nobody gave that matter any thought, but the whole thought was to extend your own plant.

Mr. MARTIN. Mr. Fields, the question of constructing the entire plant there, the entire facilities involved not only months of time, but would also have involved the carrying of coal from the very fields where our plant is erected, 90 miles over a single-track road, which, in the best of conditions is congested, and the Government officials wanted to have two separate plant locations on which they could get power. If they had followed the true economics of the situation they would have erected both plants in the Warrior coal field instead of hauling coal and transmitting the power. But the nature of the conditions was such, the transmission lines, etc., that as a matter of war protection the situation was divided into two plants. The idea was to have a call on our Warrior station, and also have a plant at Sheffield. We had nothing to do with the policy in connection with the matter, of course. That was entirely beyond our province. It might interest you to know that within 30 or 40 days after this work at Warrior began, we received orders to stop the construction. We did not know why, but it was then developed that Mr. Washburn had proposed to the Government that it build a new nitrate plant at Kingsport, Tenn., and that the Government transfer this entire Warrior equipment to the plant at Kingsport. We knew nothing about it and had nothing to do with it. It was the plan of Mr. Washburn to erect a plant at Kingsport, Tenn. He carried that idea forward and succeeded in stopping the work. Other representatives of the Government took the position that it was to the interest of the Government that this work at Warrior proceed, but that delayed it for ten days or two weeks. That happened in the early part of the work. Mr. Washburn had no connection with our situation and was not acting for us directly or indirectly. I merely mention that so that you can understand the full situation.

Mr. Frederick Darlington was chairman of the power section of the War Industries Board. He is, in part, my authority for this statement; Maj. R. D. Coombs, who is in this room now, is also authority for that statement. He was one of the officers in charge of this work, and I am sure he would be glad to answer any questions you would care to ask him about it.

Mr. FIELDS. You have stated that th's company owned the land abutting dams 2 and 3. I suppose it has been a part of the plan of your company to develop the power at Muscle Shoals as your needs would justify that being done?

Mr. MARTIN. We did own a site at dam No. 2, but we transferred it to the Government for \$1. We still own property rights at dam No. 3.

Mr. FIELDS. I say I suppose that in connection with this general scheme you entertained the hope that you might be granted a franchise under which you would develop power at dams 2 and 3, as you developed a market for it?

Mr. MARTIN. Of course, to some extent that is the situation. The whole situation at Muscle Shoals was one of long years' standing. Mr. Worthington was in charge of the matter in behalf of our company for many years, until his resignation from our company.

Mr. FIELDS. Of course, you had a perfect right to do that. Now, if in order to meet a great public need or the demands of the Government, it becomes necessary for the Government to develop this or have it developed under some contract, you would not undertake, or you would not regard it as a proper policy to disregard the needs of the Government because they conflict with the interests of your own company?

Mr. MARTIN. Mr. Fields, we have never disregarded the interests of the Government. We transferred property rights at dam No. 2 to the Government for \$1. So far as the interests of the Government go, of course, those interests are paramount in the consideration of every patriotic citizen. When that question in its general terms is applied to a specific situation, you have to deal with the situation to which it is applied. I prefer to answer it in that form.

Mr. FIELDS. Your agreement with the Government of 1917 was entered into on the part of the Government by Col. Joyes?

Mr. MARTIN. Col. Joyes represented the Government.

Mr. FIELDS. Then any alterations of or additions to the contract were made by other officers?

Mr. MARTIN. Col. Joyes was in charge of the work of construction from first to last. These gentlemen to whom I have referred were undoubtedly working either with him or under his supervision in that whole situation.

Mr. FIELDS. Was Capt. Noble an emergency officer?

Mr. MARTIN. He was an emergency officer.

Mr. FIELDS. What was his business before he went into the Army?

Mr. MARTIN. He was a lawyer.

Mr. FIELDS. Where?

Mr. MARTIN. He practiced in New York City.

Mr. FIELDS. Was Maj. Coombs a Regular Army officer or an emergency officer?

Mr. MARTIN. He came into the service as an Engineer officer during the war.

Mr. FIELDS. What was his business before that?

Mr. MARTIN. He lived in New York. He was an engineer.

Mr. FIELDS. And Col. Beames was an emergency officer?

Mr. MARTIN. Yes.

Mr. FIELDS. What was his business before he went into the Army?

Mr. MARTIN. He was an engineer, too.

Mr. FIELDS. Where is he from?

Mr. MARTIN. He lives in New York.

Mr. QUIN. Please tell us something about the stockholders of the company of which you are president? Where is the majority of that stock owned?

Mr. MARTIN. Mr. Quin, practically all of the preferred stock of the Alabama Power Co. is owned by some 3,000 stockholders residing in Alabama. The common stock is owned by the Alabama Traction, Light & Power Co. (Ltd.), and about 52 per cent of the Alabama Traction, Light & Power Co. stock is held in this country and Canada and 48 per cent in other countries.

Mr. QUIN. What countries other than this country?

Mr. MARTIN. England, Belgium, the Netherlands, Norway, Sweden—in fact, many of the foreign countries in small lots.

Mr. QUIN. How much of the stock is held in those countries across the water?

Mr. MARTIN. Approximately 48 per cent.

Mr. QUIN. How much do the Canadian interests hold?

Mr. MARTIN. My recollection is approximately 10 per cent.

Mr. QUIN. How much stock does the Alabama Traction, Light & Power Co. (Ltd.) hold?

Mr. MARTIN. That is the stock I was speaking of.

Mr. QUIN. Then, there is 58 per cent held outside of the United States and 48 per cent held across the water, 10 per cent being held in Canada—that is, 58 per cent outside of the United States. Where are these securities floated?

Mr. MARTIN. Are you speaking of stock or of all securities?

Mr. QUIN. I am speaking of stock.

Mr. MARTIN. That is approximately it.

Mr. QUIN. You have answered in reference to the stock. I want to know about your other securities. You issue bonds, do you not?

Mr. MARTIN. Yes.

Mr. QUIN. What percentage of your bonds are held outside of the United States, and other securities or evidence of indebtedness?

Mr. MARTIN. Taking it as a whole, there is about 63 per cent of all our securities in this country and 37 per cent out of this country; that is approximately correct.

Mr. QUIN. That is outside of the United States?

Mr. MARTIN. Yes; 63 per cent in this country and 37 per cent abroad; that was almost a complete reversal of the condition which existed in 1914.

Mr. QUIN. You stated that your predecessor, Mr. Mitchell, was the president of this company. He was born in England, was he not?

Mr. MARTIN. No, sir; he was born in Canada. He was a citizen of Massachusetts from his early boyhood and continued to be until his death.

Mr. QUIN. Was he naturalized?

Mr. MARTIN. Yes—he was either naturalized or born of American parents.

Mr. QUIN. You are a native-born citizen of Alabama?

Mr. MARTIN. Yes, sir; born in Judge Almon's district up near Muscle Shoals.

Mr. QUIN. The question of this contract being dated the 9th of November, 1918, is purely one of the record of the date of the signing of that instrument, is it not, so far as the contract is concerned? It had been in force and effect since the 1st day of December, as I understand it.

Mr. MARTIN. We had been operating under either verbal or written instructions; they did not rise to the dignity of an agreement. But letters had passed in the nature of work orders, modified from time to time to meet the progress

of the work. Those understandings or relationships culminated in this contract in November, 1918.

Mr. QUIN. Mr. Martin, it is hardly probable that a contract of that magnitude would have been entered into by your company without an understanding, because you did start on the work in 1917?

Mr. MARTIN. To the contrary, Mr. Quin, our company entered upon it without any specific understanding, simply because the Government wanted us to build the transmission line and get power for its purposes. The question of a contract was naturally one to come up later, as in the case of thousands of people who had arrangements with the Government of one kind or another to supply it with equipment and products to be used in the war. The question of contract was one of secondary importance and so considered by everyone. The main question was to do the work and get the results the officers of the Government wanted.

Mr. QUIN. It was understood that the Government was to finance that work, and a fee, as stated by you, was to be paid by the Government; your company was to do the work. That was clearly understood, was it not?

Mr. MARTIN. The two fundamentals were that the Government would finance the work and we would agree to buy the plant upon the demand of the Government at a fair value.

Mr. QUIN. Those were the fundamentals in there in 1917, were they not?

Mr. MARTIN. When we began, yes, sir.

Mr. QUIN. You know what a contract is; you are a lawyer. Your minds were bound to come to a meeting before you entered upon any such big job as that.

Mr. MARTIN. To that extent, yes; as to how it should be worked out, that was left to a detailed contract.

Mr. QUIN. State exactly, as near as you can, all that was understood between your company and the Government at that time, in December, 1917.

Mr. MARTIN. Well, in the first place, we were to undertake the construction, immediately and in advance of the other work, of the transmission line—and that was settled first—a transmission line over which the Government could obtain power at Muscle Shoals. This transmission line was to have a capacity of 30,000 kilowatts. The question was to get that line built, leaving to the future the determination of how much power the Government would take out of our system to meet its needs at that location. We were asked to expedite the construction of that transmission line with all speed. We did undertake at the Government's request to do it, and we started our men working, by telegraphic orders, largely at our own expense, before there was any definite arrangement for obtaining money from the Government, and we financed it for a considerable period. That work went forward and the discussions also went forward with Maj. Coombs and Col. Joyes as to what could be done to give the Government a source of power amounting altogether to 30,000 kilowatts from our system. There was no authority in the Government at that time to agree to sell us this extension. There was corporate authority in our company to agree to purchase on the demand of the Government at a fair value. So the fundamentals as finally accepted were that we would purchase at a fair value on the demand of the Government and the Government would finance the extension.

Mr. QUIN. That was understood in 1917, that feature of it, in December, 1917.

Mr. MARTIN. Yes, sir; that feature of it.

Mr. QUIN. And alone you could not have embarked upon such a proposition?

Mr. MARTIN. We could not have embarked upon the financing of it.

Mr. QUIN. You could have done the work upon the cost-plus plan, but you do not believe the Government would put all that money on the property of the Alabama Power Co. without an understanding, do you? And they did not do it without an understanding, and that understanding was in December, 1917?

Mr. MARTIN. Yes.

Mr. QUIN. And when that understanding was brought about, was there any written evidence of it?

Mr. MARTIN. Simply the work orders.

Mr. QUIN. Was there no kind of a drafted document of the War Department, or some branch of the War Department?

Mr. MARTIN. Not in December.

Mr. QUIN. No kind of documentary evidence made by the Government? Were those War Department officers so derelict and negligent as not to have some kind of a memorandum or writing?

Mr. MARTIN. I can not say they were derelict at all. They wanted the results; they wanted the power. The question of the terminology of a contract was secondary. They were willing to go ahead and start a program and they were willing to consider our agreement verbally as binding us, as it did bind us, and we did agree upon it finally.

Mr. QUIN. That was an agreement which terminated in the expenditure of about \$5,000,000?

Mr. MARTIN. Yes.

Mr. QUIN. Without any kind of a written agreement or memorandum or anything on the part of the Government?

Mr. MARTIN. Work orders and our acceptance of them.

Mr. QUIN. No kind of a written instrument or memorandum filed in the Alabama Power Co.'s office?

Mr. MARTIN. These work orders and our acceptance of them.

Mr. QUIN. Is there anything stating a conclusion reached by these verbal or telephonic communications of record?

Mr. MARTIN. There may be; I will have to look that up for you.

Mr. QUIN. If you have anything of that kind I wish you would put it in the record.

Mr. MARTIN. I will be glad to do so.

Mr. QUIN. You started to work about what date?

Mr. MARTIN. December 14.

Mr. QUIN. 1917?

Mr. MARTIN. Yes.

Mr. QUIN. How much of that work was completed on the 9th day of November, 1918?

Mr. MARTIN. It was largely completed. The transmission line had long been completed, and our chief engineer reminds me that 95 per cent was completed.

Mr. QUIN. How much, approximately, of the \$5,000,000 had been expended?

Mr. MARTIN. I can not say how much of those payments had been made at that time. You would have to get that from the Government officials.

Mr. QUIN. Your records would not show that?

Mr. MARTIN. I can not say that the records would show the exact expenditures because there was a disbursing officer of the Government acting under Maj. Coombs, who controlled that question.

Mr. QUIN. At the time of the signing of the armistice you had about completed the building?

Mr. MARTIN. That is correct.

Mr. QUIN. You did not have the machinery installed?

Mr. MARTIN. Yes; I think the machinery was installed; it was practically ready to run.

Mr. QUIN. Before you began the Government work you had constructed a building about 100 by several hundred feet?

Mr. MARTIN. I do not remember exactly; it was half the size of the building you saw in these pictures.

Mr. QUIN. And the building you constructed for that purpose for the Government was the same size, practically?

Mr. MARTIN. It is a little larger.

Mr. QUIN. The machinery that the Government unit had was, of course, of a stronger type, and put up on a more expensive basis?

Mr. MARTIN. It was a larger unit.

Mr. QUIN. And was worth more money?

Mr. MARTIN. It cost more money than ours did.

Mr. QUIN. What land did you own there at the time you started the Government work, as near as you can recollect?

Mr. MARTIN. We owned 20 or 30 acres of land in fee, and possibly 50 acres or 75 acres of surface.

Mr. QUIN. Do you own any more than that now?

Mr. MARTIN. Yes.

Mr. QUIN. When did you acquire it, what year?

Mr. MARTIN. We extended our surface title, I think we acquired the remainder—we own 100 acres of surface title; that is my recollection.

Mr. QUIN. About what year?

Mr. MARTIN. Either 1917, 1918, or 1919; I do not remember, Mr. Quin.

Mr. QUIN. It must have been after this contract with the Government.

Mr. MARTIN. It is very likely.

Mr. QUIN. You said you had at that time 30 acres?

Mr. MARTIN. We had 20 or 30 acres in fee simple, and we had the surface title on 50 acres additional. There was a coal-mining company in which we had an interest, and there were other interests in the coal mining company, and we acquired part of the surface title from the coal company, and later acquired additional surface title from the coal company to enable us to properly police the village and to make additional improvements in the camp. We own 100 acres, as I recollect now.

Mr. QUIN. After the armistice was signed, the Government constructed some railway or electrified some railway, did it not?

Mr. MARTIN. From the very first there was a program of constructing what is known as the Drifton Railroad extension. That is an extension of the Southern Railway line from where it stopped some distance from this plant down to this plant, the idea being to get additional sources of coal supply to the plant, in case there should be an interruption of a supply of power to the plant.

Mr. QUIN. That was constructed after the armistice, was it not?

Mr. MARTIN. It was completed after the armistice. The Government agreed to advance \$30,000 for the construction of that road and we advanced the balance; we advanced \$105,000 over the \$30,000 advanced by the Government.

Mr. QUIN. Then, after the armistice was signed the hammer and saw were busy until the spring of 1919, by the Government and with the Government's money?

Mr. MARTIN. I do not recall now. There were some men there, there were a few men there, but the work was practically completed. We completed the railroad and the Government simply advanced some money. That was an expensive operation.

Mr. QUIN. Did you not complete those houses after the armistice was signed; that is, for the offices of the company, and for the men to live in?

Mr. MARTIN. There was some finishing of the houses, I imagine. I do not know that there were any more houses built. The chief engineer tells me there were not. These were operatives' houses, of course.

Mr. QUIN. The War Expenditures Committee went down there, did they not?

Mr. MARTIN. No, sir; I am very sorry to say, Mr. Quin, that the War Expenditures Committee did not go down there. I think they would have handled this whole situation differently if they had gone. They would have seen what it was and would have been better able to appreciate the entire situation which confronted us down there at that time.

Mr. QUIN. Then they were in error when they said in their report that irrespective of the armistice the work was pushed rapidly, and the entire installation was made and work not stopped until in April, 1919?

Mr. MARTIN. They were in error in making a general statement of that kind. We have answered that statement, all of those statements, in a written memorandum, which is now in the Congressional Record. This Committee on War Expenditures did not go to that place, and gave us no opportunity to appear before it. We knew nothing of their report until it was filed, and I asked Senator Underwood to spread our answer upon the Congressional Record, and now that you have introduced the Graham report, I am going to ask leave of the chairman to file as a part of this proceeding our answer to those proceedings and to that report.

Mr. QUIN. You say it is already in the record?

The CHAIRMAN. Of course, this committee is holding its own investigation. Mr. Graham's committee may have made findings about your company, but I do not think this committee has anything to do with that.

Mr. MARTIN. That is correct, but some one has already introduced into these hearings the Graham report, so far as it deals with this company, and it is now a part of this record.

The CHAIRMAN. I do not recall that the Graham report was made a part of this record.

Mr. MARTIN. Then may I take the liberty of referring specifically on the record to our answer to those charges or criticisms in the Graham report?

The CHAIRMAN. I frankly do not believe the Graham report is a part of the record of this committee. Therefore, there is nothing to answer.

Mr. MARTIN. I simply wanted to refer to the Congressional Record, wherein it is contained.

The CHAIRMAN. I do not think this committee ought to take up that matter.

Mr. DENT. Mr. Chairman, I think you misunderstood Mr. Martin. All he wants is for the reporter to note where the answer to the Graham report appears in the Congressional Record, giving the date and page number of the Congressional Record.

The CHAIRMAN. I have no objection to that.

Mr. MARTIN. The answer is contained in the Congressional Record at page 1275 and following, under date of January 10, 1921.

Mr. FIELDS. In whose remarks?

Mr. MARTIN. They were offered in the Senate by Senator Underwood, and they were offered at my request in a telegram, which is also set out in this record.

Mr. QUIN. They spoke of a turbogenerator being furnished at a cost of approximately \$2,000,000, installed after the armistice?

Mr. MARTIN. No; it was installed before the armistice; 95 per cent of the work was completed at that time.

Mr. QUIN. When was it tested? They say it was tested in December, 1919.

Mr. MARTIN. It was tested on Thanksgiving Day, 1918, and the test went into December and into January. Then the machine was not found satisfactory and it was taken down and some of the parts were returned to the factory. The machine remained down for months. Then the machine was restored to its original condition and was tested again and more trouble developed, and it was not until May, 1919, that the machine was pronounced in order and all testing correct. These changes were made by the manufacturers. The troubles were due to the character of steel which they were able to obtain at that time, and it was not of sufficient tensile strength to meet the severe tests of that character of operation.

Mr. QUIN. Did your company carry on the supervision of the work by the Government after the armistice?

Mr. MARTIN. The supervision of the work?

Mr. QUIN. Yes; or did you do it?

Mr. MARTIN. The Government had an agent there.

Mr. QUIN. Your company did the work and the Government supervised it?

Mr. MARTIN. Yes.

Mr. QUIN. They had officers there for that purpose?

Mr. MARTIN. They had Maj. Coombs, Capt. Stiles, Capt. Hemphill, and several other officers were stationed there.

The CHAIRMAN. Were they emergency officers or Regular officers?

Mr. MARTIN. They were all emergency officers.

Mr. QUIN. What work was done with Government money in addition to this building, and equipping the building and putting up those houses?

Mr. MARTIN. There was the equipment of the stations.

Mr. QUIN. Equipping both stations or only one?

Mr. MARTIN. No—

Mr. QUIN (interposing). The equipment for this one big station?

Mr. MARTIN. For this extension.

Mr. QUIN. All those buildings built for residential purposes and the completion of the transmission line?

Mr. MARTIN. Yes; the transmission line.

Mr. QUIN. What else?

Mr. MARTIN. I do not recall anything except the substations. There was an extension of our substation.

Mr. QUIN. What substations were finished with the Government's money?

Mr. MARTIN. The Warrior station was enlarged to meet the requirements. In order to transmit this power we have to generate it at one voltage, 6,600, and we step it up to 110,000 volts and transmit it, and to step it up you have to have a layout in a substation consisting of transformers and switches, and things of that kind.

Mr. QUIN. Where is that substation?

Mr. MARTIN. Right at the plant. The transmission lines run out of the plant into the station and go through transformers, where the power is stepped up to the transmission voltage and transmitted to the point where it is to be used, and at the other end it is reduced again through a transforming station to the voltage required.

Mr. QUIN. How many dollars were invested there by the Government, approximately?

Mr. MARTIN. At this location, \$3,500,000.

Mr. QUIN. Where was that other money spent?

Mr. MARTIN. Part of it was in the transmission line to Sheffield and the other part was in the substation at Sheffield.

Mr. QUIN. Was the balance of the \$3,500,000 in the plant itself?

Mr. MARTIN. It is set forth in the statement sent to this committee by Secretary Weeks. That shows that there was \$3,400,000 in the Warrior generating station, \$383,000 in the Warrior substation; in the transmission line—

Mr. QUIN (interposing). That is the transmission line to Muscle Shoals?

The CHAIRMAN. Are you reading from one of the statements made before the committee?

Mr. MARTIN. Yes.

The CHAIRMAN. It is all in the record.

Mr. QUIN. I want to get the amount of money actually put in the plant and transmission line.

The CHAIRMAN. That is in the record.

Mr. QUIN. I wish you would tell me what amount you have in the plant, not counting your land, in the buildings and equipment, as near as you can approximate.

Mr. MARTIN. I think I stated this morning it was \$3,000,000.

Mr. QUIN. I thought that included your land holdings.

Mr. MARTIN. You can not separate land from the rest of it.

Mr. QUIN. You have approximately \$3,000,000 invested at that point in your own money?

Mr. MARTIN. Yes, and in addition to that we have various properties which we acquired in connection with this same situation.

Mr. QUIN. And the Government has in all \$5,000,000 in that property and the transmission line, as I understand it, and you have \$3,500,000 in those plants?

Mr. MARTIN. No; our investment there in connection with this Warrior plant is a part of the system which represents some \$35,000,000 of investment by our company.

Mr. QUIN. I understand that; but I want to get into the record the exact amount at that point.

Mr. MARTIN. In addition to this plant forming a part of our system, if you can segregate it, which I do not believe you can, because the system has to be balanced up, and it is balanced with this steam plant reserve, the steam plant reserve represents something in excess of \$3,000,000. In addition to that we expended approximately \$1,000,000 for various items which I enumerated this morning in connection with this work, and that makes more than \$4,000,000; but you can not segregate that from the system because there are other investments in the system, dependent for their value and usefulness upon this Warrior station.

When you get into that question as to the investment which is really dependent upon this station, you get into a very large question.

Mr. QUIN. What is the matter with the Government taking that second unit and building its own transmission line to Muscle Shoals?

Mr. MARTIN. Why can not the Government do it?

Mr. QUIN. Yes.

Mr. MARTIN. Of course the Government can do it if it does not want to carry out its contract with us.

Mr. QUIN. I am not discussing that feature of it.

Mr. MARTIN. Leaving outside the contract?

Mr. QUIN. Yes; I am taking it as a business proposition. As a physical possibility the Government can do that. There is a big building and equipment there and the Government could complete the transmission line to Muscle Shoals as well as you could?

Mr. MARTIN. Yes.

Mr. QUIN. You built 68 miles of that on Government money, and it is on your land?

Mr. MARTIN. Yes; but it would cost the Government a good many hundreds of thousands of dollars to take that equipment and erect a new station, because the Government is using our facilities, foundations, intakes, ash-handling facilities, lands, coal, houses, and various things, substations and all those things have to be taken into account when you undertake to set up a new layout for a plant. You have got to start on the foundation in getting a plant. If you want to take this equipment, I do not know how much more it would cost you.

Mr. QUIN. As a matter of fact, Mr. Martin, the United States Government owning a majority of the investment there, has the vested right, under the Constitution, under condemnation proceedings to acquire your interests if you could not arrive at an amicable adjustment; as a legal proposition it could do that; could it not?

Mr. MARTIN. I can not accept your premise.

Mr. QUIN. The Government has the right, under the Federal Constitution to condemn property.

Mr. MARTIN. The Government has the right to take private property for public use upon paying just compensation.

Mr. QUIN. Then the question involved is purely one of whether or not the Ford proposition is pro bono publico, and what the value of that property would be, so far as the Constitution is concerned? I would like to have you answer yes or no to that question.

Mr. MARTIN. I can not answer yes or no on that hypothesis.

Mr. QUIN. All right; I will take your way of answering it.

Mr. MARTIN. When you come to treat this question you must remember that it is a public utility engaged in serving sixty-odd towns and cities in Alabama. It has obligations to thousands of people. We have 20,000 direct and probably 40,000 additional consumers. You have to remember the service you are dealing with. It is not private property in the ordinary sense of private property, and you have to remember that this station is a part of a big hydroelectric system for the purpose of enabling that company to better serve the public by rendering service throughout the year, service which they could not get through any other hydroelectric station without this reserve. A large part of this business is founded on the delivery of power throughout the year. The company has the right to make those contracts, and it has those obligations to others growing out of its very relationships. When you come to consider those questions, as to what the compensation will be, as to the right of the United States to take property, I will not undertake to express an opinion upon that question. I am merely giving you the facts. You are a lawyer; you can draw your own conclusion.

Mr. QUIN. I have a very definite conclusion on that.

Mr. MARTIN. I simply wanted you to know the facts.

Mr. QUIN. If the Government exercised the right of eminent domain there would be no physical impossibility, although great inconvenience for your company, to erect another plant similarly located for that purpose.

Mr. MARTIN. Mr. Quin, when you come to deal with that question—

Mr. QUIN (interposing). Can you answer that question yes or no? You know the location down there?

Mr. MARTIN. No; it is not physically feasible without going to an entirely new location. Then you have to build a new transmission line, buy new rights of way, and bring this power from a new station to load centers; you have to build a new substation, and you have a great many problems which you meet with. There are lines that radiate out of this station. This is the coal district of Alabama. We have 40 or 50 coal mines operated with electric power from our company. We furnish power for the operation of industries of various kinds, and all that would be disarranged and would have to be rearranged if you say we must close this station and build another. How are you going to do it?

Mr. QUIN. You can operate this until you get the other one built. There would be a way found to keep you from losing that. There would be no trouble except the expense the Government would pay, and the great inconvenience to your company.

Mr. MARTIN. And to the public.

Mr. QUIN. Does not the Government sometimes condemn and take a person's home? Even a railroad can do that, and you have the right under the law, as a public-service corporation, to go through any man's field.

Mr. MARTIN. We have certain limitations upon the right to condemn.

Mr. QUIN. Public-service corporations of the United States have that right, and the Government certainly reserves that right which it has against public-service corporations or private individuals.

Mr. MARTIN. Of course, the Government has the right under the Constitution to take private property for public use upon paying just compensation. But when you analyze that provision and apply it to a situation like this, there are presented other problems which appeal to you as they do to me, and which I will not attempt to pass on now.

Mr. QUIN. The Ford proposition does not appeal to your company, as I understand it?

Mr. MARTIN. I think that is a problem for the committee to pass on. If you will pardon me.

Mr. WRIGHT. Mr. Martin, do you understand that there is any difference between the term "fair value" and the term "fair market value," or are they synonymous?

Mr. MARTIN. In the law relating to such situations as this, I think there is possibly a difference. Fair value, Mr. Wright, you will find is the basis or term used in the decisions of the Supreme Court of the United States when it comes to fixing value in rate-making cases; it is the fair value of the property. You may consider market value, although I am not prepared to say whether the question of market value enters into it. "Fair value" is the term used in the rate cases.

Mr. WRIGHT. Being a lawyer, I would like to ask you what, under the terms of the contract, you would consider the term "fair value" to mean. Suppose a board of arbitration should be appointed under the terms of the contract to assess a fair value which your company is to pay for this development there. What measure would they adopt, what elements would enter into it, applying the words "fair value" to this peculiar situation?

Mr. MARTIN. One of the questions to be looked at is the original cost, and the question of the reproduction value. Then there would be the question of the condition of the property itself; then the question as respects its age, the very nature of the property, its value in public service—there are a great many elements of that kind to be considered.

Mr. WRIGHT. Fair market value means usually what a given piece of property would bring if offered by an owner who would sell but was not obliged to sell, and was purchased by a purchaser who would purchase but was under no necessity of buying. Is not that a fair definition of fair market value?

Mr. MARTIN. Possibly; a willing buyer and a willing seller.

Mr. WRIGHT. Yes; with no necessity on the part of either one. The owner would sell but he is not obliged to sell, and some other man would buy but he would not be obliged to buy.

Mr. MARTIN. In this contract both the buyer and the seller are named. Each of the parties has agreed with the other, one to buy and the other to sell, and the only problem left is the determination of the amount.

Mr. WRIGHT. I want to get at what elements would enter into that, and you have told me that.

Mr. MARTIN. The fact that under this contract, as you just said, there can be one seller and one purchaser would of itself limit the value of the property, would it not?

Mr. MARTIN. I have not so interpreted it.

Mr. WRIGHT. In other words, there is nobody in the world situated like your company with reference to this property down there?

Mr. MARTIN. That is why we use the term fair value. That insures the Government a fair valuation at the hands of the arbitrators.

Mr. WRIGHT. Would not that be taken into consideration—that is, the fact that there can be only one purchaser and only one company or individual who can use the investment the Government has made?

Mr. MARTIN. I do not believe it would, under the terms of a fair valuation.

Mr. WRIGHT. Would not that be an element of the probable use to which the property could be put?

Mr. MARTIN. No one can put it to a greater public service use than a company such as ours. It is the highest form of use.

Mr. WRIGHT. Take a piece of real estate. It might be adapted to the construction of storehouses or it might be peculiarly suited for residential purposes. That would be an element of value. One piece of real estate might be adapted to a great many different uses which would enhance the commercial value of it. Is it not a fact that the uses to which any given piece of property could be put largely affect its market or fair value?

Mr. MARTIN. It might affect one and not the other.

Mr. WRIGHT. As to this particular piece of property, it is so developed that the Government can make but two uses of it; one is to sell it to your company and the other would be to move it away.

Mr. MARTIN. That was inherent in the situation from the beginning.

Mr. WRIGHT. If I understand your contract, it is limited to those two elements of value.

Mr. MARTIN. That is why we obligated ourselves to buy on the terms mentioned in the contract, because that was the situation.

Mr. WRIGHT. So it stands on a very different footing from an ordinary piece of property in the hands of the Government or anyone else when it comes to the matter of sale?

Mr. MARTIN. The Government either owned property which it could not sell to some one else, or—

Mr. WRIGHT (interposing). I understand the contract; I want to get the peculiar situation.

Mr. MARTIN. You have to consider all the elements in discussing it.

Mr. WRIGHT. Mr. Martin, how many dam sites or dams does your company own in northern or western Alabama?

Mr. MARTIN. We simply own these two at Muscle Shoals. I think we have two on a small creek in Jackson County.

Mr. WRIGHT. How many have you developed?

Mr. MARTIN. We have developed in our system one at a point known as Jackson Shoals and another on the Coosa River. We are in process now of developing, and we are actually constructing another development, on the Coosa River to have 110,000 horsepower capacity. That is being constructed under the terms of the Federal water power act. That is in course of construction and will be in service at the end of the year. We have been ready and waiting on Congress for a good many years to pass legislation under which we could develop water powers.

Mr. WRIGHT. Are there very many desirable water powers in that section aside from the ones you own?

Mr. MARTIN. There are a great many water powers in Alabama, small and large.

Mr. WRIGHT. I mean those of any consequence. The one on the Coosa River and the one on the Tennessee River are the principal ones in that section?

Mr. MARTIN. Yes.

Mr. WRIGHT. Who owns those?

Mr. MARTIN. We own the ones I referred to.

Mr. WRIGHT. Those are the principal dam sites or power sites?

Mr. MARTIN. Those two are.

Mr. WRIGHT. Mr. Martin, you say your company acquired the abutments on dam site No. 2. Was that property acquired at one time or in separate parcels?

Mr. MARTIN. It was acquired at different times. The Muscle Shoals Co. that owned the title was organized in 1906, and from then on for a period of a good many years the company acquired rights and property.

Mr. WRIGHT. From time to time?

Mr. MARTIN. Yes.

Mr. WRIGHT. I am speaking about the key to the situation—the dam-site property.

Mr. MARTIN. Some time probably in 1912.

Mr. WRIGHT. That your company purchased?

Mr. MARTIN. This company purchased? The people who now own or control the situation, the present stockholders, had no interest in the Muscle Shoals Co. prior to 1912.

Mr. WRIGHT. You mean to say it was first purchased by a water power company?

Mr. MARTIN. By some citizens of Alabama.

Mr. WRIGHT. Called the Muscle Shoals Co., and your company purchased from them?

Mr. MARTIN. Purchased the stock of the Muscle Shoals Co.

Mr. WRIGHT. Which carried with it—

Mr. MARTIN (interposing). The properties it had.

Mr. WRIGHT. That was in 1912?

Mr. MARTIN. Yes. We took over the stock of that company in 1912. Mr. Worthington had been in active charge of that company's work for many years and was president of that company until March, 1920.

Mr. WRIGHT. That property was acquired—that is, the site and the flowage rights—at an expense of about half a million dollars?

Mr. MARTIN. We had expended about half a million dollars on the No. 2 site.

Mr. WRIGHT. What did you do?

Mr. MARTIN. We purchased the lands. We had been carrying the property from 1906 up to the time of this development.

Mr. WRIGHT. You made no development; you simply own the property?

Mr. MARTIN. Own the property.

Mr. WRIGHT. Now, without in the slightest questioning your generosity or patriotism, Mr. Martin, will you tell the committee just the consideration which prompted your company to donate this site to the Government? Do you mean to tell the committee it was intended purely as a voluntary gift to the Govern-

ment, just an outright donation to the Government, without any return to your company or any prospect of any advantages accruing to the company? I just want to know about that.

Mr. MARTIN. That letter I read to you—

Mr. WRIGHT (interposing). That is a splendid letter; the sentiment is fine and well expressed.

Mr. MARTIN. I did not write it, but I thank you for that, anyway.

Mr. WRIGHT. You are quite capable of writing one as good.

Mr. MARTIN. The letter speaks for itself. We were asked by numerous citizens of that district to make a donation to encourage development, and we did. It was made at the time the Government was engaged in a war program. It was not an industrial program upon which the Government was engaged, it was a war program.

Mr. WRIGHT. Just coming down to this proposition as man to man, you are an Alabamian and I am a Georgian; of course, in this Great War there were a great many sacrifices made on the part of men and women, even to the supreme sacrifice. Women all over the country deprived themselves almost of the necessities of life; their food in some instances was short; they did not have enough sugar or wheat bread all the time. There were sacrifices made and deprivations on the part of the people everywhere, and ultimately a great many of them made the supreme sacrifice. We all understand that.

Do you know of any companies over this country who did work for the Government in the construction of cantonments or any other enterprises who contributed those things to the Government?

Mr. MARTIN. Contributed what?

Mr. WRIGHT. Do you know of any who made contributions?

Mr. MARTIN. Of property such as this?

Mr. WRIGHT. Yes.

Mr. MARTIN. I think it was very rare.

Mr. WRIGHT. Does not your case stand out singly and alone during the whole war as the only company which made a literal donation of a piece of property worth half a million dollars?

Mr. MARTIN. I will go further, and say the property is worth a great deal more than half a million dollars.

Mr. WRIGHT. It cost you that?

Mr. MARTIN. Its value is more than that.

Mr. WRIGHT. Then, keeping in mind the fact that the country has never been considered insolvent, but has always been able to pay its obligations, and did pay handsomely during the war, there was no limitation upon the conduct of the war, so far as money was concerned—I want to know whether you tell me, man to man, that your company simply made this voluntary donation to the Government without expecting any reward or hoping for any development that would be made there, but just parted with it without any thought of anything like that?

Mr. MARTIN. I mean to tell you we made the donation and the deed, and I mean to tell you also that in the making of the deed we discussed it with everyone who had any interest in the situation in Washington. It was the unanimous feeling at that time that in the progress of this development there should be a surplus of power for governmental purposes, which would reach the public over transmission lines such as ours. That was expressed in the letter I read this morning. That was the situation on one side.

Mr. WRIGHT. The further fact is, Mr. Martin, that the Muscle Shoals Co. had exploited this property and tried to finance it for many years.

Mr. MARTIN. I would not express it just that way.

Mr. WRIGHT. They wanted a development made there, they sought some interests which would finance it, and they had not succeeded.

Mr. MARTIN. It was not financed; that is correct.

Mr. WRIGHT. Mr. Martin, it is no secret, is it, that for many, many years it was extremely difficult in the South to finance a water-power proposition?

Mr. MARTIN. Yes; it was difficult, but at the same time our company was ready to act, to have the project financed, and an act passed Congress, but President Taft vetoed it. At different times since then our company has been in a position to finance water-power development. We are now financing a development which will cost us about \$9,000,000.

Mr. WRIGHT. It is easier to finance one now with your holdings and the business you have worked up, than it would be for a pioneer?

Mr. MARTIN. It is quite different now.

Mr. WRIGHT. Mr. Martin, you spoke a few moments ago about this property being conveyed to Mr. Ford. Of course, that is not the contention. Under the Ford offer the property goes back to the Government at the end of 100 years, if he should lease it from the Government; that is, Dam No. 2. I wanted to get the record straight on that. It would not be conveyed to Mr. Ford.

Mr. MARTIN. I do not know what the situation is about that.

Mr. WRIGHT. Speaking about your contract, the work under the contract was practically completed before the contract was really executed?

Mr. MARTIN. It was.

Mr. WRIGHT. I think you have explained about what was going on in the meantime, but the fact remains that the contract was not executed until the work was completed?

Mr. MARTIN. Yes.

Mr. WRIGHT. Mr. Martin, going back to the donation of the dam site, when your company came to construct this Warrior River steam plant, you did not even donate your services in doing that, did you? I am not criticizing you; I think you ought to have been paid for it.

Mr. MARTIN. If you examine the situation first and last, you will find that we came out rather on the financial bad side of it.

Mr. WRIGHT. That may be true in connection with the matter of taxation. But you were to get a fee of \$220,000, and did get it.

Mr. MARTIN. Yes; but it did not cover our losses or our expenses.

Mr. WRIGHT. The Government financed it all the way through?

Mr. MARTIN. Yes.

Mr. WRIGHT. In addition to the fee you received, there is embodied in the contract the right to purchase?

Mr. MARTIN. At a fair value.

Mr. WRIGHT. You said the only two rights the Government would have would be to sell the property or move it, and it would be ruinous to the Government to undertake to move that investment.

Mr. MARTIN. Yes; and I can not say that it was ever contemplated.

Mr. WRIGHT. That would be reckless?

Mr. MARTIN. In my judgment, it would.

Mr. WRIGHT. In other words, it would be practically a loss for the Government to undertake to move that, including the buildings and machinery?

Mr. MARTIN. I am sure the Government would come out better if it undertakes the arbitration in accordance with the contract and permits us to go forward in accordance with the contract and buy, than if it undertakes to remove the property.

Mr. STOLL. Is it not a fact, Mr. Martin, that the people of Alabama are very hostile to the Alabama Power Co.?

Mr. MARTIN. Mr. Stoll, there are many people in Alabama who take the view that this power at Muscle Shoals should be developed and distributed by the Alabama Power Co. There are thousands of people who believe that. There are, on the other hand, thousands of people, no doubt, who think Mr. Ford would succeed in his undertaking. We have in Alabama thousands of stockholders.

Mr. STOLL. I have seen a statement in the papers from prominent citizens of Alabama that 99 per cent of the people of Alabama are against the Alabama Power Co. That was the statement that was made.

Mr. MARTIN. I think that is a very exaggerated statement.

Mr. STOLL. So that your general reputation in Alabama, you think, is good?

Mr. MARTIN. I think it is.

Mr. STOLL. Who made the plans for the Gorgas extension?

Mr. MARTIN. They were made, I suppose, by Maj. Coombs and Mr. Thurlow; either made by Maj. Coombs or made by Thurlow, the chief engineer of our company and approved by the Government engineer, or made by the Government engineers in connection with our engineers; I do not know which way it was.

Mr. STOLL. Who was responsible for the interlocking of the Government plant and your plant?

Mr. MARTIN. The inception of the arrangement involved the operation of the station as one plant.

Mr. STOLL. It was necessary to do that?

Mr. MARTIN. It could not have been operated as a separate station.

Mr. STOLL. Is that the Alabama Power Co.'s idea to tie the two together?

Mr. MARTIN. It was not an idea—it was our idea to furnish the Government power, and there was no other way to furnish the Government the power—

Mr. STOLL (interposing). Somebody must have conceived the idea of having the two plants interlocked.

Mr. MARTIN. We had foundations; we had preparatory work; there was six months' advantage gained in making use of those facilities and installing equipment on those foundations. That was in the minds of the Government officials and ourselves. It was not a question of benefitting the Alabama Power Co.; the time element was a very great factor.

Mr. STOLL. At that time was it the intention of the Alabama Power Co. to take over this plant later?

Mr. MARTIN. It was part of the program; the Government said to us this plant can be extended to meet our needs, provided you will agree to buy it at a fair value on our demand, and we agreed to that.

Mr. STOLL. That was agreed to before you commenced to build?

Mr. MARTIN. It was a part of our common understanding.

Mr. STOLL. Before you commenced to build it?

Mr. MARTIN. Yes.

Mr. STOLL. I think you testified that they said to go ahead, and you went ahead?

Mr. MARTIN. I said there were two fundamentals, Mr. Stoll; first, the transmission line that was constructed. We were told to construct the transmission line. Three weeks passed before there was any definite understanding with regard to the extension. The transmission line would enable the Government to take power out of our system. When it came to the extension of the power station there were two fundamentals involved. One was that the Government would finance the extension and the other was that we should agree to buy at a fair value on the demand of the Government. Col. Joyes and Maj. Coombs put those two fundamentals down, and on those two fundamentals we agreed to go ahead.

Mr. STOLL. This transmission line furnishes power only to the plant at Muscle Shoals?

Mr. MARTIN. Yes; the 110,000-volt line.

Mr. STOLL. There is no other place where you could use it unless it was used there, unless you carry the line somewhere else?

Mr. MARTIN. There is a substation at the Waco quarry, on the line.

Mr. STOLL. I mean, however, in reference to the power used in the Government development in making nitrates at Muscle Shoals, there is no other purpose it could be used for, is there?

Mr. MARTIN. Except to supply power in the community for distribution.

Mr. STOLL. Is there any demand there for it?

Mr. MARTIN. Yes.

Mr. STOLL. A sufficient demand to use it?

Mr. MARTIN. To use this line. We have been asked many times by the commercial companies to serve them power for distribution in that district.

Mr. STOLL. In your contract, I believe, you stated in case the Government let some other party have it, that certain things would happen. Is it optional with you to take over this property under your contract?

Mr. MARTIN. Under our interpretation of the contract the Government, if it does not ask us to buy, is under contract to sell, if we ask the Government to sell.

Mr. STOLL. Suppose you do not ask them to sell it.

Mr. MARTIN. Provided it is not removed.

Mr. STOLL. Could they remove it and get anything for it?

Mr. MARTIN. That is a problem.

Mr. STOLL. In your opinion, do you think they could remove the property and get anything for it?

Mr. MARTIN. Of course they can get something for it, but I could not estimate about how much.

Mr. STOLL. Practically nothing?

Mr. MARTIN. I would not put it that way.

Mr. STOLL. You would have to tear it all down?

Mr. MARTIN. You have the equipment there, which is of substantial value, and it is not good business, as a straight question of taking it away, when some one is willing to buy it at a fair value.

Mr. STOLL. Do you not think that was a contract solely for your benefit in particular?

Mr. MARTIN. No, sir; I do not, because we agreed to buy on demand of the Government. They considered the two fundamental terms before they would go ahead.

Mr. STOLL. Just a moment. Unless the Government sells it to you it must be torn down; no one else can have it under that contract; that is true, is it not?

Mr. MARTIN. That is true.

Mr. STOLL. The Government could not sell it to a party and have it all torn down and get a fair profit out of it?

Mr. MARTIN. Not a profit; no.

Mr. STOLL. Therefore it must be a contract where you get the best side of it?

Mr. MARTIN. It is not that at all. The Government contemplated that this property when created would be sold to the Alabama Power Co., and the Alabama Power Co. contemplated it would buy the property.

Mr. STOLL. Why did they put this provision in the contract then?

Mr. MARTIN. Suppose we do not buy, and the Government does not make the demand of us to buy; then the property is there.

Mr. STOLL. If the Government can not sell it, why can they not demand of you to buy it?

Mr. MARTIN. I do not know; I can not conceive of any reason why the Government should not demand of us to buy.

Mr. STOLL. Why would they put that into the contract?

Mr. MARTIN. That is one of the safeguards of the transaction.

Mr. STOLL. You do not think it protects you?

Mr. MARTIN. In this case only——

Mr. STOLL (interposing). You are a lawyer?

Mr. MARTIN. I am.

Mr. STOLL. You do not think that protects you?

Mr. MARTIN. It protects us against some one else coming in or buying it, and that is what is was intended to do.

(Thereupon, at 5.15 o'clock p. m., the committee adjourned to meet Monday, February 27, 1922, at 10.30 o'clock a. m.)

MUSCLE SHOALS PROPOSITIONS.

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES.
Monday, February 27, 1922.

The committee met pursuant to adjournment at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. Mr. Dent and Mr. Martin, are you ready to proceed?

Mr. DENT. Yes; we are ready, Mr. Chairman. We have present here to-day one of the subscribing witnesses to the contract between the Government and the Alabama Power Co., who is ready to testify as to the actual date of the execution of the contract, if the committee desires to hear further testimony on that subject.

The CHAIRMAN. In order to identify the contract, we will be glad to have the witness make a statement.

STATEMENT OF MR. F. D. MAHONEY, ALABAMA POWER CO., BIRMINGHAM, ALA.

Mr. DENT. Mr. Mahoney, were you connected with the War Department in any capacity during the war?

Mr. MAHONEY. I was.

Mr. DENT. In what capacity?

Mr. MAHONEY. I was consulting engineer along electrical lines to the Ordnance Department.

Mr. DENT. Do you remember the contract between the War Department and the Alabama Power Co. relative to the so-called Gorgas steam plant?

Mr. MAHONEY. I do.

Mr. DENT. Were you a witness to that contract?

Mr. MAHONEY. I witnessed its signatures; yes, sir.

Mr. DENT. Where was it signed?

Mr. MAHONEY. It was signed on the twenty-ninth floor of the Equitable Building, in the office of Mr. James Mitchell.

Mr. DENT. In New York City?

Mr. MAHONEY. New York City.

Mr. DENT. What was the date of its actual signature?

Mr. MAHONEY. The date was the day of the false report of the armistice.

Mr. DENT. Do you remember what date that was?

Mr. MAHONEY. November 7, 1918, I believe.

The CHAIRMAN. The testimony has been that it was November 9, but you fix it at November 7?

Mr. DENT. Mr. Chairman, Mr. Martin testified that it was on the day of the false report, which he thought was the 9th, but on looking up the record, it appears it was the 7th. I thought myself at the time it was the 7th. That is all, unless the committee want to ask Mr. Mahoney some questions.

Mr. JAMES. Who are you working for at the present time?

Mr. MAHONEY. I am with the Alabama Power Co.

Mr. JAMES. In what position?

Mr. MAHONEY. Commercial manager.

Mr. JAMES. How long since?

Mr. MAHONEY. I went to work with the Alabama Power Co. in February of 1919.

Mr. JAMES. In February of 1919?

Mr. MAHONEY. Yes, sir.

Mr. JAMES. How did the contract happen to be signed in New York City instead of here in Washington?

Mr. MAHONEY. I do not know anything about the reasons for that, Mr. Congressman, I am sure.

Mr. JAMES. Whom did you go up to New York with?

Mr. MAHONEY. I was stationed in New York at the time and was called over there, I believe, by Lieut. Col. Beames to assist him or to look over certain particular paragraphs of this contract which was all ready at that time for signature, and it was signed on that day.

Mr. JAMES. Is that the only time you know anything about this contract?

Mr. MAHONEY. No; I had had connection with it prior to that time, but not in some six months prior to that time, I suppose.

Mr. JAMES. Whom did you work for before you went into the Army?

Mr. MAHONEY. I was with the American Gas Co. of Philadelphia.

The CHAIRMAN. Were you an emergency officer during the war?

Mr. MAHONEY. I was not, Mr. Chairman. I was attached in a civilian capacity, as a consulting engineer, to the Ordnance Department.

The CHAIRMAN. You were not in the Army at all?

Mr. MAHONEY. I was not.

Mr. MCKENZIE. Under whose employ were you serving in the War Department?

Mr. MAHONEY. I was in the Ordnance Department. I was under Col. Joyes in the nitrates division up until about—I think the date was July or August, when I went over to New York under Mr. Frederick L. Cranford, who was made director of construction of all nitrate plants, and was an assistant to Mr. Frederick Cranford from that time until I left in February.

Mr. MCKENZIE. How did you happen to get into the service of the Government?

Mr. MAHONEY. I was working at the time on some transmission line work up in New York and up in the anthracite regions of Pennsylvania, and I think my first knowledge of this situation came through Mr. Edward Wells, chief engineer of the J. G. White Co., who was constructing Nitrate Plant No. 1 at Sheffield. I was naturally desirous of getting into the service and he told me about this work, and I got in touch with the Ordnance Department and went on to this nitrates program.

Mr. MCKENZIE. What was your age at that time?

Mr. MAHONEY. Twenty-eight.

Mr. MCKENZIE. When did you enter the service? That is, you were not in the military service at all.

Mr. MAHONEY. No, sir; not in the military service, in a sense. It was in the latter part of 1917.

Mr. MCKENZIE. Did you make any effort to get into the military service?

Mr. MAHONEY. Indeed I did.

Mr. MCKENZIE. What was the trouble, physically not fit?

Mr. MAHONEY. No, sir. Of course, I went in with the thought of being commissioned an officer. At that time there was some question about commissioning fellows of my age in Ordnance or out of the line capacity, because I was in the draft age, and the thing went up and back, and it is a long story as to how it came out, but I never did get my commission.

Mr. MCKENZIE. You were working for a Philadelphia electrical company?

Mr. MAHONEY. I was working for the American Gas Co., a holding company, in Philadelphia.

Mr. MCKENZIE. But after your service with the Government you did not return to your former company, but entered the employment of the Alabama Power Co.?

Mr. MAHONEY. Exactly.

Mr. MCKENZIE. Did the Alabama Power Co. hold out inducements that led you to go with them rather than with your former company?

Mr. MAHONEY. After the armistice was signed we in Mr. Cranford's office were engaged in winding up the affairs of plants 3 and 4, which as you may recall from the testimony, were salvaged, and I had a portion of that work; that is, gathering all the data and arranging for the cancellation of the various contracts which were extant on plants 3 and 4 and some on plant 2. Naturally, I was looking to my future after that work should wind up. I had several offers from various concerns, among them the company I had left, the American Gas Co., and one of them from Mr. James Mitchell, of the Alabama Power Co., and that was the offer which I finally accepted.

Mr. MCKENZIE. What are your duties at the present time?

Mr. MAHONEY. I have charge of matters of power sales, rates, investigations, valuations, and any operation in the smaller towns that the company owns and operates, railway plants or electric systems.

Mr. MCKENZIE. You are not a stockholder in the company, I take it.

Mr. MAHONEY. I am.

Mr. MCKENZIE. You are a stockholder and employee?

Mr. MAHONEY. Yes, sir; as practically every employee of the Alabama Power Co. is.

Mr. STOLL. When did you acquire that stock in the Alabama Power Co.?

Mr. MAHONEY. When?

Mr. STOLL. Yes.

Mr. MAHONEY. Within the last year.

Mr. STOLL. Since you were connected with them?

Mr. MAHONEY. Oh, yes.

Mr. STOLL. Do you know why it was that this contract was dated back to December 1, 1917?

Mr. MAHONEY. I do not, Mr. Stoll; unless it was to validate work which had been done—more as a ratification than anything else. I never heard it discussed. I do not believe I noticed at the time the date of the contract. I just happened to be present in the building or in the conference, and was used as a witness.

Mr. FIELDS. What did I understand you to say your duties were while you were with the Ordnance Department?

Mr. MAHONEY. My duties were many, but my position was that of consulting electrical engineer.

Mr. FIELDS. Were you on this Muscle Shoals or Gorgas proposition?

Mr. MAHONEY. I was on the entire program, Mr. Fields—Muscle Shoals, Gorgas, nitrate plants 3 and 4 at Cincinnati and Toledo.

Mr. JAMES. Were you offered a position by the Alabama Power Co.?

Mr. MAHONEY. Was I offered one?

Mr. JAMES. Yes.

Mr. MAHONEY. Yes, sir.

Mr. JAMES. While you were in the employ of the Government?

Mr. MAHONEY. It was about the middle of January, 1919, when Mr. Mitchell first discussed with me the matter of going to Alabama.

Mr. QUIN. What was the date, as near as you can recall, that you were connected with the construction of this plant at Gorgas and the Muscle Shoals nitrate plants?

Mr. MAHONEY. I presume it was in January of 1918 that I first heard of this phase of the situation, Mr. Quin, the Gorgas phase of the Muscle Shoals situation; somewhere in January of 1918.

Mr. QUIN. When did you go to work with that enterprise?

Mr. MAHONEY. About that time.

Mr. QUIN. And that was under the contract of December 1, 1917, that that construction was going on?

Mr. MAHONEY. Yes, sir.

Mr. QUIN. Did you stay with that branch of the service until the armistice was signed?

Mr. MAHONEY. Not directly connected with the Washington office. As I say, I was moved over to New York in July or August.

Mr. QUIN. I meant with that branch of the service.

Mr. MAHONEY. Yes, sir.

Mr. QUIN. Who was paying you, the Government or the contractor?

Mr. MAHONEY. The Ordnance Department.

Mr. QUIN. The Ordnance Department was paying you, not as an officer, but as a civilian?

Mr. MAHONEY. Yes, sir.

Mr. QUIN. That work was carried on under the contract which is dated December 1, 1917, was it not?

Mr. MAHONEY. Yes, sir.

Mr. QUIN. The Alabama Power Co. did its part under that contract, as you understand it?

Mr. MAHONEY. Yes, sir.

Mr. QUIN. They received their pay or fee under that contract?

Mr. MAHONEY. Yes, sir.

Mr. QUIN. Do you know anything about how the fees were paid?

Mr. MAHONEY. I do not, sir.

Mr. QUIN. You were not one of the bookkeepers?

Mr. MAHONEY. No, sir.

The CHAIRMAN. If there are no further questions, we are very much obliged to you, Mr. Mahoney.

Mr. DENT. Now, Mr. Chairman, the other witness to this contract, Col. Beames, lives in New York City, and we are prepared to get him here, but not to-day, and if the committee desires any further testimony we will bring him down here just simply to take the time of the committee to prove the date of the actual execution of the contract. We have a telegram from him to the effect that he remembers distinctly that it was on the day of the false report of the armistice.

The CHAIRMAN. You can file the telegram.

Mr. DENT. The telegram from him relative to his recollection as to when the contract was executed?

The CHAIRMAN. Yes.

Mr. DENT. All right.

Mr. MCKENZIE. As I understand it, Col. Beames was an Engineer officer?

Mr. MARTIN. He was an Engineer officer, yes, sir; Lieut. Col. Beames.

The CHAIRMAN. And what is his full name?

Mr. MARTIN. C. F. Beames.

(The telegram referred to follows:)

[Telegram.]

MACON, GA., February 4, 1922.

THOS. W. MARTIN.

Care Hotel Waldorf Astoria, New York, N. Y.

As a witness to the signing of contract No. T-69, bearing date December 1, 1917. I confirm your understanding that said contract was finally executed by the contracting officer and the late Mr. Mitchell at New York, on November 7, 1918.

C. F. BEAMES.

Mr. DENT. Mr. Chairman, there is just one additional statement Mr. Martin would like to make, and then I will be prepared to go ahead and wind up.

ADDITIONAL STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO., BIRMINGHAM, ALA.

The CHAIRMAN. We will be glad to hear from Mr. Martin.

Mr. MARTIN. I just want to make an additional statement. Mr. Chairman, to the effect that no one connected with the proposal of Mr. Henry Ford in any way has taken up with us this subject of our property rights; and no one representing the Government has taken up with us the subject of our property rights prior to the hearings before this committee, and we would have liked to have had, but did not have, an opportunity to present our views to the Judge Advocate General. We had no opportunity, prior to the time the matter came before this committee, to present our case.

Mr. DENT. In other words, neither party to the contract consulted you with reference to your property rights at all.

Mr. MARTIN. No. That is correct.

The CHAIRMAN. Then, let me ask you these questions. At the beginning of July, say, of 1921, you were engaged in your present business of selling power?

Mr. MARTIN. Yes.

The CHAIRMAN. And I presume also electricity.

Mr. MARTIN. We were.

The CHAIRMAN. Did you receive, from the Chief of Engineers of the War Department, any letter suggesting to you to make an offer for the Muscle Shoals property?

Mr. MARTIN. We did.

The CHAIRMAN. Did you accept that?

Mr. MARTIN. I would be glad to go into that subject but that leads possibly into another branch of the question, but if you wish me to, I will go into it now.

The CHAIRMAN. I think it would be well to go into it because that matter has been brought to the attention of the committee by the Chief of Engineers.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. He called the attention of the committee to the fact that he issued probably a dozen letters to people who were in that business at that

time, and said that the Ford offer was the only reply received favorable to this proposition that we are considering.

Mr. DENT. Mr. Chairman, if I may make a suggestion, would not that be properly in line with the hearing when you consider the bid of the Alabama Power Co. rather than to mix it up with this proposition which we are contending is purely the assertion of their legal rights under the Ford proposition. Of course, we are ready to go into it right now.

The CHAIRMAN. There is no particular hurry about it. If you intend to go into it when you present your other matter, that is time enough, I take it.

Mr. MARTIN. Yes.

The CHAIRMAN. But I think we ought to have your statement completely regarding the answer you gave Gen. Beach.

Mr. MARTIN. We had planned to go into that, Mr. Chairman.

Mr. FIELDS. It seems to me that might have some bearing on the legal aspect of the proposition.

Mr. QUIN. No; it could not do that.

The CHAIRMAN. I do not think it is very material whether it goes in here or whether it goes in, in reference to their own proposition. I do not think the place it goes in is material.

Mr. MILLER. As I understand it, we are now on that portion of the hearing where the Alabama Power Co. is asserting or wants to point out its legal rights under the Ford offer.

Mr. DENT. Exactly.

Mr. MILLER. And when they get to the submission of their own proposition, then it seems to me it would be better to bring up the matter suggested by Mr. Martin.

The CHAIRMAN. I have stated that the committee at that time will be very glad to hear him on the proposition. Mr. Martin, Mr. James would like to ask you a question.

Mr. JAMES. What percentage of this work was done by subcontracts; I mean, the work at the Gorgas plant.

Mr. MARTIN. On such work as grading we employed, I think, some contractors who had teams to do some grading work, and possibly some contractor to supply erectors of steel. It was a very small percentage.

Mr. JAMES. Did you pay those men monthly?

Mr. MARTIN. They were paid on the pay roll twice a month, so the Chief Engineer states.

Mr. JAMES. Did you have a written contract with those contractors?

Mr. MARTIN. Yes.

Mr. JAMES. Were these contracts with the subcontractors dated before or after this contract was signed in New York City.

Mr. MARTIN. I am speaking from pure recollection, but I would assume they were dated subsequently. I have nothing to fix it in my mind.

Mr. JAMES. As a good business proposition you figured it was to your interest in looking after the interests of the Alabama Power Co. to have written contracts with your subcontractors signed at about the time they started to work.

Mr. MARTIN. Those things emanated in the form of a letter in the nature of a purchase order from the engineering staff of the Government at Birmingham.

Mr. JAMES. I mean the work of your subcontractors.

Mr. MARTIN. I do not know that I have any definite idea one way or the other about that. Our chief engineer states they were mostly handled on purchase orders approved by the resident engineer of the Government, just as in the case—

Mr. JAMES. I am not talking about that. You said you hired men to do grading, etc., as subcontractors. Did you have a written contract with those subcontractors?

Mr. MARTIN. I assume it was in the nature of a purchase order. That is the way the work moved from time to time.

Mr. JAMES. Will you put in the record the dates of the contracts with these subcontractors?

Mr. MARTIN. We can not furnish the dates of the contracts or purchase orders with subcontractors from data which we have here in Washington. However, as these contracts or purchase orders related only to grading, and as all grading was completed on or before November 1, 1918, these subcontracts or purchase orders were all dated prior to that time.

Mr. DENT. That is all we have from Mr. Martin, Mr. Chairman, unless there are some further questions.

Mr. QUIN. Mr. Martin, who designed and made the specifications for the work you did down there. Did the Alabama Power Co. do that?

Mr. MARTIN. In the first instance, Mr. Quin, the Alabama Power Co. had made plans for the enlargement of this power station. On those plans it had arranged to purchase equipment or had placed orders for some equipment for a new unit—a second unit. Those plans were practically completed for that particular size unit that we wanted. When the Government came into it, those plans, of course, were available to the Government. They had to be changed from time to time to meet the new ideas that the Government engineers had. Among others, the Government engineers wanted larger equipment than the equipment we had planned. From time to time additional plans were made, either made by our own engineering staff and approved by the Government engineers, or made by the Government engineers, in conjunction with our engineers.

Mr. QUIN. Then you mean to state that the original plan of this Gorgas plant and transmission line—

Mr. MARTIN. Not the transmission line, because we had no plans on the subject of the transmission line.

Mr. QUIN. Did you make that plan for the continuation of the 68 miles of transmission line?

Mr. MARTIN. We did make that plan; yes.

Mr. QUIN. Then the Gorgas plant was designed by the Alabama Power Co., was accepted with certain variations by the Government, and whatever changes were made in it were made, perhaps, by your company in conjunction with the Government's engineers?

Mr. MARTIN. Yes, sir; the recital in the contract, in the opening clause, states that the company had, among other things, in connection with this extension, Item D plans and specifications.

Mr. QUIN. That is, the Alabama Power Co.?

Mr. MARTIN. Yes, sir; that is in the contract.

Mr. QUIN. Then, that part of the contract you carried out.

Mr. MARTIN. We did.

Mr. QUIN. You carried out the construction of it?

Mr. MARTIN. Yes.

Mr. QUIN. Did you draw your fees along as the work was being done, or wait until it had all been completed, before you drew your fees?

Mr. MARTIN. I am sure I could not tell you.

Mr. QUIN. I presume you drew it, like other contractors, as the work went along?

Mr. MARTIN. The chief engineer advises it was toward the end of the job that the fee was paid.

Mr. QUIN. About what time, if you have any evidence on that?

Mr. MARTIN. It was late in the work, Mr. Quin. We would have to find the records to tell you.

Mr. QUIN. Will you find out about that and put it in the record?

Mr. MARTIN. Yes; we will undertake to find that out.

The information requested is as follows:

"The payment of \$60,000 to the company by the United States, provided for by article 12 of contract T-69, was received November 27, 1918. The contractor's fee, provided for in article 13 of said contract, was received as follows: November 27, 1918, \$100,000; April 18, 1919, \$75,000; May 28, 1919, \$50,000."

Mr. QUIN. The work from starting the breaking of the ground clear on to completion had to be paid for, did it not?

Mr. MARTIN. Yes.

Mr. QUIN. And the Government advanced all of that money?

Mr. MARTIN. It did after the work was well started; yes.

Mr. QUIN. And you paid your men and the subcontractors out of Government funds?

Mr. MARTIN. No; the Government took over the pay rolls and made direct payments for the work after the job was well advanced, and had a disbursing officer on the job and handled the payments direct.

Mr. QUIN. Mr. Wurzbach asked you the other afternoon to produce the letters and written memoranda and working orders; have you procured those?

Mr. MARTIN. Yes, sir; there is quite a batch of them [indicating].

Mr. QUIN. Will you put those in the record, according to his request?

Mr. MARTIN. Yes.

(The letters, work orders, and written memoranda requested are as follows:)

NOVEMBER 6, 1917.

Col. J. W. JOYCE,

Ordnance Department, Washington, D. C.

DEAR SIR: In a conference to-day Mr. Frank S. Washburn, president of the American Cyanamid Co., asked the Alabama Power Co. to formulate a definite proposal as to what it was prepared to do in the way of supply of power to the proposed new nitrate works at Muscle Shoals, Ala., on the Tennessee River.

Until such time as there shall have been definitely determined the details of the Government's requirements we are only able to formulate a proposal along general lines, and one which may be considerably modified as to details in carrying it out.

The financing of such an installation at this time would not be warranted by the present needs of the power company, but it is prepared to cooperate in every possible way with the Government in the undertaking which you have in view.

We estimate that the necessary additions to our Warrior River steam plant and the transmission lines and substation necessary for delivering power at Muscle Shoals will cost approximately \$2,250,000. If the Government will finance the undertaking and assist in deliveries, the power company will be prepared to install with maximum urgency the necessary steam plant, substation, and transmission lines. The company will supply 30,000 kilowatts, delivered to the Muscle Shoals substation at a combined energy, and demand charge of 7 mills (\$.007) per kilowatt-hour.

The power company will undertake to set aside 3 mills (\$.003) per kilowatt-hour for all energy supplied under this proposal until the Government has been reimbursed for all sums advanced to the company in this connection.

We understand the power requirements of the proposed nitrate plant, so far as this company is now concerned, to be about 30,000 kilowatts, which must be in readiness in about six months. The company can be in readiness with this amount of power within the time required, and with the completion of the extension above referred to can continue to furnish this amount of power regularly.

The company has contracts with the Gulf States Steel Co., Tennessee Coal & Iron Co., many coal mines, the Southern Manganese Co., and various graphite products companies, all of which are directly connected with the proper conduct of the war, whose continued operations will not be affected under the plan proposed herein.

The Alabama Power Co. has available considerable apparatus which ordinarily takes a long period to obtain and which might be used in connection with the proposed work. It also has an excellent construction and operating organization with a long experience with local conditions.

Holding ourselves at your orders for further treatment of the subject, we are,

Very respectfully, yours,

ALABAMA POWER CO.,
JAMES MITCHELL, *President.*

" SUGGESTED BASIS FOR CONTRACT BETWEEN ALABAMA POWER CO. AND UNITED STATES
FOR POWER FOR AIR NITRATES CORPORATION PLANT AT SHEFFIELD.

"Whereas the United States desires to obtain from Alabama Power Co. at as early a date as possible after the completion of the nitrate plant on or after June 1, 1918, about 35,000 kilowatts, and Alabama Power Co. has contracted for all the power from its existing plants that are economical to operate, and can not finance at this time any extensions of plants, but has existing at its Warrior River plant certain foundations and accessories for two 35,000-kilowatt units additional to what is now installed; and

"Whereas Alabama Power Co. would effect some economies in the operation of its present Warrior plant by operating therewith other units and would derive benefit from the use of such quantity of power as might be available after meeting the United States needs from additional units there installed; and

"Whereas the United States would likewise derive benefit from the economies of joint operation of all the units—that now existing and those now proposed to be installed at the Warrior plant—and would thereby derive the further benefits of power at a cost probably lower than elsewhere obtainable and of the assurance

of ample power for its needs by the guaranties of the Alabama Power Co., based upon all its plants;

"Agreed that the Alabama Power Co. shall acquire at its expense the necessary rights of way and shall build a transmission line from its Warrior plant to the Air Nitrates Corporation plant at Sheffield, and also upon its existing foundations at Warrior, so far as suitable, to erect suitable temporary building and procure and erect therein and on said foundations one 85,000-kilowatt turbo-generator, with battery of boilers and all accessories as now there exist and can serve such unit in addition to that now installed belonging to Alabama Power Co., and also procure and erect ready for use but without boilers, etc., therefor, another similar 85,000-kilowatt turbo-generator as a spare generator available in the event of temporary unserviceability of the aforesaid one;

"The United States to pay all cost of the foregoing constructions and procurements, except right of way, and in addition as remuneration for its services and as payment in full for whatever of its existing facilities, etc., may be used to aid in such work, a basic fee of — per cent of such cost, provided such fee is understood to be based upon completion and availability for use of the transmission line by six months from date of contract and of the first power unit complete by eight months from said date, and that, as representing the estimated value to the United States of such utilities, a sum equal to 1 per cent of said fee on each of said utilities shall be added to the 5 per cent fee thereon for each day by which completion shall antedate the stipulated date of completion, and, likewise, 1 per cent of said 5 per cent fee shall be deducted therefrom for each day by which completion shall be delayed beyond such stipulated date, provided, however, that in no event shall the fee be less than 3 per cent nor more than 7 per cent, the Government to cooperate in securing deliveries, subject to delays beyond control.

"Also, as soon as transmission line and nitrate unit shall be completed, and upon demand of contracting officer, Alabama Power Co. to stand obligated to furnish 10,000 kilowatts and to furnish as much more as it can spare without operating Birmingham plant or depriving other customers now under contract, at rates as follows: Demand charge of \$1.25 per kilowatt per month, plus energy charge for current used according to scale, which shows for over 50,000 kilowatt hours per month a price of \$0.004 per kilowatt hour—no extras, no constructive basis for demand rate, which shall be upon 10,000 kilowatt hours, that is, \$12,500 per month—and this arrangement to continue in force until the additional power-generating equipment (first unit) above provided to be installed at cost of United States shall be ready for operation.

"Thereafter, Alabama Power Co. to operate all units at Warrior plant—their own and those of the United States—as a single plant, keeping careful cost record, furnish United States regularly 30,000 kilowatts whenever needed, whatever other customers' demands may be, supporting this guarantee by the entire system owned or controlled by it, hydro or steam, including the Birmingham steam plant; and the Alabama Power Co. to have the privilege of using as they see fit in their general business such portion of the power generated as above at their Warrior plant (including the United States owned apparatus) as the United States shall not require; and

"In consideration of such use by Alabama Power Co. of such surplus power, and the expectation of economies of such joint operation, the Alabama Power Co. agrees to accept from United States as payment in full of all obligation of United States for use of Alabama Power Co. land, foundations, accessory apparatus, right of way, and all other of its property thus used in the joint operation of the plant or in the transmission, or occupied by the articles belonging to United States and of all services whatsoever by Alabama Power Co., and any of its agents, employees, etc., only the proportions of the operating costs of the Warrior plant which the current held for or used by United States bears to total current generated.

"After June, 1921, or later date of cessation of United State participation in present war, the United States owned transmission line and power apparatus and temporary building, etc., to be leased or sold to Alabama Power Co., if law permits and if satisfactory agreement on price, and if not, all property of United States to be removed within, say, six months, from premises and right of way of Alabama Power Co. at United States's expense. The Government to commandeer power from Alabama Power system when necessary to deprive other customers in order to supply Government under any provision hereof."

WASHINGTON, D. C.,
December 7, 1917.

Col. J. W. JOYES,
Colonel, Ordnance Department, United States Army.

Washington, D. C.

SIR: This company acknowledges receipt of your purchase order (Ex. Order No. 154) of date December 7, 1917, for the construction of a transmission line from our steam plant on the Black Warrior River to the site of the proposed ammonium nitrate plant at Sheffield, Ala.

In accordance with your instructions, we are proceeding to book this order as a definite order on behalf of the Ordnance Department, United States Army, and will proceed as speedily as possible toward carrying out your instructions.

Yours, very truly,

ALABAMA POWER CO.,
By THOS. W. MARTIN,
Vice President and General Counsel.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, December 7, 1917.

ALABAMA POWER CO.,
Birmingham, Ala.:

By authority of the Chief of Ordnance you are hereby given an order to construct on lands owned by you, or rights of way under your control, from your steam-power plant on the Black Warrior River to the site of the proposed ammonium nitrate plant of the Air Nitrates Corporation at Sheffield, Ala., for the present known as the United States Nitrate Plant No. 2 a transmission line for the purpose of, and of proper capacity for transmitting electric current of 3-phase, 60-cycle and about 110,000 volts. This line to be built as economically as possible, being for the temporary use of the United States in transmission of power during the period of the present war, or thereabouts. The line to be the property of the United States, and suitable arrangements to be made as already tentatively agreed upon to cover the payment of actual cost plus a percentage thereof, to cover use of Alabama Power Co.'s lands, right of way, construction forces, and other facilities, etc., and profit. All these conditions to be embodied in a future contract.

Priority class A-1 has been requested from the War Industries Board for the manufacture of this material (copy of which is inclosed) so that delivery may be made at the earliest possible date.

Although this writing is in letter form, please book it as a definite order on behalf of the Ordnance Department, United States Army, by the undersigned, and promptly acknowledge receipt thereof.

Very truly, yours,

J. W. JOYES,
Colonel, Ordnance Department, United States Army.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, December 7, 1917.

ALABAMA POWER CO.,
Birmingham, Ala.:

By direction of the Chief of Ordnance you are hereby given an order to furnish certain electric power, as specified hereafter, to the United States Nitrate Plant No. 2, being constructed for the United States at Sheffield, Ala. (Muscle Shoals), by the Air Nitrates Corporation of New York, viz:

Upon completion of the transmission line from your Warrior plant to the United States Nitrate Plant No. 2, at Sheffield, expected to be by or soon after June 1, 1918, which you are to construct under my order XOT-154, you to furnish from any resources of your system a guaranteed 10,000 kilowatt and as much more as may be available without interfering with your present signed customers, or requiring operation of the Birmingham steam plant, and as the United States may require, at certain rates tentatively agreed upon and to be embodied in contract to be signed directly.

Following the writer's conversation with you at the Warrior steam plant Wednesday, we are holding these orders in suspense until we are further advised by you.

Yours, very truly,

CHIEF ENGINEER.

SUGGESTED BASIS FOR LEASE OR PURCHASE OF PROPOSED STEAM PLANT.

The Alabama Power Co. lease to the Government free of charge such lands, clearing sites, and foundations, tunnels, and other construction work which it may have completed or partially completed as may be necessary for the following:

The Government to pay for the construction and equipment of a power house such as may be necessary to furnish power to the terminal substation of the Sheffield transmission line, and to consist of at least one 30,000 kilowatt turbo generator, and corresponding equipment.

One battery of boilers for operating the above plant continuously at full capacity.

One spare 30,000 kilowatt turbo generator and necessary equipment except boilers and corresponding accessories.

All arranged to operate interconnected with existing Warrior steam plant.

The power company to operate the combined Warrior plant as a unit separate from the rest of the power company's system and charge each party with the power actually used at actual power house cost; each party to pay such costs, maintenance, etc., as pertains to its share of the plant.

The power company to agree to lease or buy and the Government to lease or sell its investment at Warrior site on termination of its need for war purposes. Value to be agreed upon at once and to be based on costs prevailing prior to influence of war, say years 1914-15, less depreciation, etc., and having in view its permanent value to the Government and to the company.

In case of lease company to pay 5 per cent interest and sinking fund to amortize in 12 years.

Or contract to buy on installments annually with interest on balance due.

In making price, fact of company operating plant at no cost to Government should be considered. Company to have right in meantime to use surplus capacity of plant, at its own cost.

If it be said that the Government can not under present laws bind itself to sell or lease after the war—then we suggest that an agreement can be made which will be binding on the power company by which it will agree to buy or lease from the Government on certain stated terms, within a certain period after the war—if the Congress hereafter vests power to carry out such an arrangement.

DECEMBER 19, 1917.

WAR DEPARTMENT.

OFFICE OF THE CHIEF OF ORDNANCE.

Washington, December 21, 1917.

ALABAMA POWER CO.,

Birmingham, Ala.

By authority of the Chief of Ordnance, you are hereby directed to make the following modifications of our Order XOT-154, of December 7, 1917:

In addition to the transmission line proper ordered in XOT-154, as originally drawn, that order will cover also suitable transformer station for step-up to 110,000 volts at the Warrior plant end, and suitable transformer station for step-down from line voltage to 12,000 volts or thereabouts, as to be more particularly specified by inspector, and both these stations to be complete outdoor stations with proper oil switches, etc., details to be approved by inspector.

All facilities contemplated will be of ample capacity to carry 35,000 kilowatts continuously without injury and without excessive energy loss and voltage drop. At present single circuit of 250,000 circular mills, hard-drawn stranded copper, regarded as most suitable—this to be definitely decided between you and the undersigned.

It is to be understood that every effort is to be made to have this entire line with the two substations in readiness for use by June 1, 1918, and that whatever temporary arrangements are necessary for taking the current (which you will then have to take from your own lines, instead of from your additional

generating capacity which we expect to install) must be provided in some manner satisfactory to this office.

In addition to the payments mentioned in the original order for actual cost the percentage will be 6 per cent.

Nothing else on order to be changed.

J. W. JOYES,
Colonel, Ordnance Department, United States Army.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, January 8, 1918.

ALABAMA POWER Co.,
Birmingham, Ala.

By direction of the Chief of Ordnance, Purchase Order XOT-155 and letter (T-8277) of December 14, 1917, are hereby cancelled, and you are hereby given an order to purchase and install for the United States as a temporary addition to the steam-power producing facilities at your Warrior River plant in Alabama, and to enable you to supply to the United States at Sheffield, Ala., the supply of power contemplated by a separate purchase order XOT-156, Mod. No. 1, of even date herewith, as follows:

One 30,000-kilowatt turbo-generator unit, with suitable accessories, as condensers, switchboards, battery of boilers, etc., directly necessary to its service. In addition to what you now have installed, or should properly put in for the portion of your plant now existing.

Also to install the foregoing upon your existing land and foundations, etc., and to erect thereover a temporary building for the protection of such apparatus.

Provided, That all of the foregoing work is to be performed by you, subject to the approval of the undersigned and on the basis of reimbursement of actual cost plus a construction fee in consideration of which you will allow without special rental or similar charge therefor, the use of your land, foundations, and other property as needed—the actual amount or percentage of such construction fee to be embodied in a future contract; said contract to be mutually agreed to by your company and this office, or in the event of disagreement to be referred to a competent and authorized board for settlement.

Although this writing is in letter form, please book it as a definite order on behalf of the Ordnance Department, United States Army, by the undersigned, and sign below the acknowledgment and acceptance on the part of your company.

J. W. JOYES,
Colonel, Ordnance Department, United States Army.

JANUARY 8, 1918.

We accept the above order.

ALABAMA POWER Co.,
By JAMES MITCHELL,
President.
THOMAS W. MARTIN,
Vice President and General Council.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, January 8, 1918.

ALABAMA POWER Co.,
Birmingham, Ala.

By direction of the Chief of Ordnance, purchase order XOT-156 is hereby canceled, and you are given this order to furnish certain electric power, to be specified hereafter, to the United States, at Sheffield, Ala., viz:

Upon completion of the transmission line from your Warrior plant to Sheffield, which line you are to construct under my order XOT-154, you will furnish from any resources of your system such part of 10,000 kilowatt as the United States may require; and in excess of that quantity, if available, as the United States may require. The rates of payment to be embodied in a future contract.

Also upon completion of the additions to your Warrior steam plant to be built by you for the United States, as covered by my order XOT-156, Mod. No. 2, which

completion is expected to be about August 1, 1918, you will furnish from said additions such part of 30,000 kilowatt as the United States may require, and in excess of that quantity, if available, from your system as the United States may require.

The rates for power and other terms hereunder to be embodied in a future contract; said contract to be mutually agreed to by your company and this office, or in the event of disagreement, to be referred to a competent and authorized board for settlement.

Although this writing is in letter form, please book it as a definite order on behalf of the Ordnance Department, United States Army, by the undersigned, and sign below the acknowledgment and acceptance on the part of your company.

J. W. JOYES,
Colonel, Ordnance Department, United States Army.

JANUARY 8, 1918.

We accept the above order.

FEBRUARY 28, 1918.

MEMORANDUM IN RE INSTRUCTIONS FOR DISBURSEMENTS UNDER AGENCY CONTRACTS
WITH PARTICULAR REFERENCE TO THE CONTRACT WITH THE ALABAMA POWER CO.

Purchases.—The agent—that is, the Alabama Power Co.—will issue purchase orders to vendors for material needed in the discharge of the contract work. There should be at least three copies of these purchase orders, one for the contractor, one to accompany the vouchers to the Auditor for the War Department, and one for the records of the disbursing officer who shall make the payment thereunder.

Invoices.—It would perhaps be wise for the agent to prepare a particular form of invoice to be issued by vendor containing such data as the agent may desire for his files. These invoices should be at least three in number, one for the agent, one to accompany the voucher to the Auditor for the War Department, and one to remain with the memorandum voucher in the office of the disbursing officer who shall make the payments. The invoice which shall go to the Auditor for the War Department along with the original voucher should contain the following certificate signed in each case by the vendor:

"I (or we) certify that the above account is correct and just, and that payment therefor has not been received."

When the invoice, including the one containing the certificate above indicated, shall be received by the inspector at the plant, or other Government officer, he will prepare a voucher on voucher form 330-a and attach thereto a certified copy of the invoice and also one of the duplicate copies thereof.

The inspector will also sign the certificate on the public voucher to the effect that the material has been received and that the quality and quantity are satisfactory, etc. The approval form on the voucher should also be signed by the proper officer, and if desirable the agent may also approve on the voucher the amount of the expenditures.

Payment.—After the voucher shall have been prepared in the manner above indicated it will be presented to the disbursing officer at the plant, who, if satisfied that the account is correct upon comparing it with the purchase order in his possession, will pay the voucher directly to the vendors; that is, to the persons who have filled the order that was given them by the agent.

Vouchers for the agent's profit.—From time to time the agent can state a voucher on form 330-a, signing the voucher in the place indicated for the creditor, for the amount of his profit as determined in the contract. He will, of course, be in a position to obtain the proper amount upon which to base this profit upon consulting his records as to orders given and actually filled. The agent's voucher for profit will also be certified to by the inspector and by the proper officer and will be paid by the disbursing officer at the plant in the manner above indicated.

Vouchers for pay rolls and method of authenticating payment to employees.—Under an agency contract the employees are considered as employees of the United States. This being the case, the agent will prepare the pay roll of his employees from his time records, and will certify the rolls as to its being correct. The inspector will also certify the roll on the faith of the certification of the agent or upon such independent information as he may have, and the disbursing officer will make the payments to the employees direct in whatever manner that may be the most convenient, presumably making the payments in cash.

Under recent decisions of the Comptroller of the Treasury the payment of these employees must be authenticated in the following or similar manner:

On the morning of the pay day there shall be circulated to all employees, by means of the paymaster, a form of receipt for the payment; these forms will be signed immediately by the employees, and all such employees who can not write will sign by mark, their signature to be witnessed by the paymaster, who is a United States employee. These employees will also have an identification tag of some sort, and when they appear before the paymaster for their pay they will exhibit the identification tag and also their pay receipt. The paymaster will then take up the pay receipts, and they will be filed away carefully as supporting papers in the accounts of the disbursing officer when his vouchers are sent to the Auditor for the War Department for settlement.

Advance payments.—Section 3648 of the Revised Statutes expressly prohibits the payment for any service or supplies in advance of the actual rendering of the service or the receipt of the supplies. Under this statutory provision, therefore, you would not be authorized to make a payment of a certain per cent of the purchase price of an article at the time, say, when the order was given, and further payment of a certain per cent, when the shipment began to move from the contractors plant, etc. (On the contrary the material must actually be received by the United States (although this receipt may be at the plant of the contractor if an inspector be sent there to receive it) before the payment may lawfully be made; and title must vest in the United States at the time of initial payment.

L. W. BLYTHE,

Lieutenant Colonel, Ordnance Department, National Army.

By F. J. KEELTY,

Major, Ordnance Department, National Army.

JULY 8, 1918.

Col. J. W. JOYCE,

Division T, Office of the Chief of Ordnance, United States Army.

Washington, D. C.

DEAR SIR: We have given careful consideration to the contract outline submitted to us on July 6 for operating the steam plant now being installed at the Warrior Plant for account of the United States Government. We have also had an opportunity to consult several of our directors on the subject and we are of the view that the contract outline is acceptable to this company in its major points, and in some of the minor points it is a matter of phraseology rather than meaning. I inclose herewith a copy of the memorandum as submitted to us under date of July 6 and beg to make the following comments:

Clause 1: In our original discussion on the subject of power production at the Warrior plant we called the attention of your Maj. Coombs to the fact that it was possible, although hardly probable, that some minor detail of installation essential to the operation of the plant with economy and reliability might have been omitted from the estimates, and that in such a case anything which was deemed reasonably essential to the highest economy of the plant should be furnished by the Government and installed under the terms of the existing understanding between yourself and the Power Co. The Power Co., however, does not ask that it shall be the judge as to what is or is not essential in this respect, but would willingly leave it to impartial authority on steam plant construction. The term facilities as used in your draft we shall assume therefore to cover this broadened interpretation.

Clause 2: In none of the discussions held to date has the Power Co. considered the idea of paying any rental for the equipment and facilities supplied by the Government. Consequently the provision for 6 per cent interest or rental charge is a radical innovation involving fixed charges of some \$12,000 to \$15,000 per month. In our proposal of November 7 we had in view that the Government should pay for the installation and remain owner of it until such time as the Power Co. might recapture it.

Clause 3: As regards the terms of Clause 3, this is identical with our original proposition which we submit hereto. It should be made clear, however, that the amount of energy available to the United States shall be limited to the amount that the unit installed by the Government is capable of delivering under the operating conditions imposed by the Air Nitrates Corporation at Sheffield. The Power Co. is willing to reinforce such energy by power which it may have available from other sources, provided that the Air Nitrates Corporation shall conduct its operations so as not to adversely affect the service of our general system. This can easily be done and will impose no hardship other than reasonable care in the design and operation of the air nitrates plant.

Clause 4. This clause in its general sense is acceptable.

Clause 5. For reasons fully discussed upon the occasion of our last interview the power company can not stand a retention by the United States of 3 mills per kilowatt hour and pay the interest charge mentioned in clause 2. Under certain conditions, however, the company can possibly agree to a retention of 2 mills per kilowatt hour, but this retention not to commence until the experimental period has passed and the plant is in normal operation, let us say from July 1, 1919.

Clause 6. The terms of this clause are generally acceptable.

Clause 7. The general terms of this clause are satisfactory to the company, except that the contract should be mutual. The period of three years within which the option is to be exercised should be extended to five years, and should cover so far as the company is concerned, a right to take over the transmission line. The terms under which the appraisal of the property is to be made are satisfactory to the company but the report of the appraisers should also determine the amount and period of the deferred payments.

Clause 8. This clause is acceptable.

Clause 9. This clause is acceptable.

Clause 10. This clause is acceptable.

Clause 11. This is acceptable so far as it goes. It should be stipulated, however, that adjustments for fuel costs are to be made when and as the changes in fuel cost occur and we suggest a figure of one-tenth mill per kilowatt hour for each 10 cents change in the price of fuel as determined by the Government. To this clause should be added provisions for a semiannual adjustment to meet variations in the cost of labor.

Clause 12. This is acceptable, but applies only to power delivered at the low tension side of the company's switchboard at the Warrior Plant.

Clause 13. At no time has there been any proposition on the part of the company to assume the cost of maintenance of the transmission line and it has not entered into the company's calculations. The company is willing, however, to undertake the maintenance of the transmission line for a fixed fee.

The period of this contract shall be for the duration of the war. Should at any time, however, any unforeseen circumstances beyond the control of the power company adversely affect the cost of operations the power company shall have the right to ask arbitration, with a view of being protected against abnormal and unforeseen increase in costs.

Returning to clause 2, the proposition to pay interest is going to be a severe burden on the company and unless satisfactory load and power factors are maintained by the Air Nitrates Corporation the company will be unable to earn any such charge. Under the circumstances we suggest that the rental be commuted into a certain amount per kilowatt hour supplied, and in any case not to commence prior to July 1, 1919.

In the early stage of our discussions you will remember that it was generally understood that the company should be entitled to use about 10,000 kilowatts of energy out of the unit to be installed, this to be in consideration of our investment in the site, the right-of-way, and the cost of connecting our general system into the Warrior Extension direct by high tension line so that any hydraulic and steam plants owned by the power company may be available as a reserve. This investment will amount very closely to \$600,000.

This, I believe, covered our views as to the outline of the contract for the operation of the plant and we are ready to proceed at once with the definite contract.

Very truly, yours.

JAMES MITCHELL, *President.*

ALABAMA POWER CONTRACT OUTLINE RE WARRIOR POWER.

JULY 6, 1918.

(1) Thirty thousand kilowatt unit and other facilities to be installed at Warrior at the expense of United States. Also transmission line to Nitrate Plant No. 2. Both on property and right of way of Alabama Power Co.

(2) The Power Co. shall pay the United States, as annual rental for the use of the facilities provided by the United States hereunder, an amount equal to 6 per cent of the cost to the United States of the proposed facilities (exclusive of transmission line) during such periods as the United States may require from the Power Co. the service contemplated under this agreement; such rental payment to be made in equal monthly installments.

(3) Power Co. to operate the power plant at Warrior and to supply current for operation of United States Nitrate Plants No. 1 and No. 2, near Sheffield, Ala., at 7 mills per kilowatt-hour, delivered at the switchboards at such plants; 110,000 volts, 3-phase A. C. The amount of energy available to the United States for such operation is to be that corresponding to the capacity of such unit, and any other power which the Power Co. may have available for such use.

(4) During such periods as the United States shall require the service from the Power Co. above provided the United States shall guarantee a minimum payment for current to be supplied pursuant thereto of \$25,000 per month.

The United States may discontinue the demand for such service on 60 days' notice at any time, in which event the United States shall, during the period of such discontinuance of demand, be relieved of the obligation as to minimum monthly payments hereunder, and the Power Co. shall correspondingly be relieved of the payment of rental for the facilities of the United States during the period of such discontinuance of demand for service, unless the period of any such discontinuance of service exceeds 60 days, there shall be no change in the minimum payment or rental charges.

Such service to be restored on 60 days' written notice by the United States, after which the minimum payment and rental charges shall become effective.

(5) The 30,000 kilowatt unit and other facilities and transmission line to remain the property of the United States, but of the above payment of 7 mills per kilowatt-hour, the amount of 3 (?) mills per kilowatt-hour is to be retained by the United States.

(6) When the amount so retained by the United States aggregates the amount of the cost to the United States of the 30,000 kilowatt unit and other facilities provided at the expense of the United States, and installation expense thereof, plus the cost to the United States (exclusive of the transmission line to nitrate plant No. 2) then the title to the 30,000 kilowatt unit and other such facilities (except the transmission line) to pass to the Power Co.

(7) The United States to have the option at any time not less than three years after the termination of the war or termination of the supply of power hereunder, whichever may be the later date, to elect that the Power Co. shall take over the 30,000 kilowatt unit and other facilities provided at the expense of the United States at a value to be determined by appraisal, such appraisal to take into consideration the value of the property to the Power Co. under the then conditions. The Power Co. to have a reasonable period to make payment of the amount due on account of such sale, not less than 5 years or more than 10 years; deferred payments to bear interest at the rate of 5 per cent and title to property to remain in United States until paid for in full. Credit to be given Power Co. for amounts retained under provisions of (5).

(8) Power Co. to assume full operating responsibility for the operation of the plant and to maintain apparatus in first-class operating condition, and shall make good any damages due to use, accident, or otherwise.

(9) Power Co. to agree to continue to supply power for the requirements of the United States at reasonable prices, taking into consideration capital investment, operating costs, and reasonable depreciation after recapture of property by Power Co.

(10) If the United States is prepared to furnish coal to Power Co. at a price lower than that on which energy rate is based, under adjustment clauses, Power Co. will accept such coal, on reasonable notice with reference to Power Co.'s obligations to accept coal from other sources. Energy rate to be adjusted correspondingly for power generated by coal so furnished by United States.

(11) Energy rate based on standard coal at \$2.30 per ton. Adjustment up and down for variations in coal cost.

(12) Contract to become effective on 30 days' written notice by the United States, such notice to be given not later than December 1, 1918, provided the proposed facilities at Warrior are completed for operation at that time.

Temporary power to be furnished in the meantime on basis \$12,500 per month per 1,000 kilowatt maximum demand, plus 5 mills energy charge, as provided in contract draft May 20, 1918.

(13) Transmission line to be maintained by Power Co., but policing transmission line to be at expense of United States.

WAR DEPARTMENT,
Washington, October 19, 1918.

THOMAS W. MARTIN, Esq.,

Alabama Power Co., Birmingham, Ala.

DEAR SIR: I send you a revised set of articles 1 to 21, with the exception of article 15, of proposed contract between the United States and the Alabama Power Co. in reference to electric energy to be furnished for the operation of certain nitrate plants. I think you will find articles 1 to 14 in almost exactly (perhaps in exactly) the shape in which they were left after we went over them together on the night of the 17th. If there are any changes you will discover them upon comparison with your notes. Article 15 I am not yet ready to send, for I have been unable to confer with Mr. Burchard. These articles are subject to further modification if this be found necessary.

Some of the articles between 16 and 21 are still in draft form. I shall be unable to send a revision of those following article 21 until I have had an opportunity to confer with Mr. Burchard. I have not yet learned when he will be in Washington again.

Respectfully,

WILLIAM WILLIAMS,
Lieutenant Colonel Ordnance Department,
United States Army.

OCTOBER 30, 1918.

LIEUT. COL. WILLIAM WILLIAMS,

Ordnance Department Building, Washington, D. C.

DEAR SIR: I inclose two redraft copies of the following articles:

Article 24, arbitration; article 25, disputes not covered by article 24; article 26, time delays due to causes beyond contractor's control; article 27, cancellation and termination before completion; article 28, measuring instruments, testing; article 29, approval by contracting officer; article 30, payments not subject to counterclaims; article 32, bond; article 33, revenue from housing, stores, etc.; article 34, contract nonassignable; article 35, service of notices; article 36, lien; article 37, definitions.

I hope to receive your suggested article 31, and further suggestions that may occur to you. Possibly then we can meet on Saturday or Monday next for a final agreement.

I am not prepared to say that article 27 is in acceptable form, but am sending my redraft for your consideration.

I also inclose your manuscript from which these copies are made.

There may be some other few changes in this draft which I will suggest at our meeting.

Very truly, yours,

THOMAS W. MARTIN,
Vice President and General Counsel.

[Telegram.]

NEW YORK, October 31, 1918.

Lieut. Col. WILLIAM WILLIAMS,

Room 200, Ordnance Department Building, Washington, D. C.

Further conferences seem advisable to agree upon all details of contract. Can you join us here Saturday or Monday?

THOMAS W. MARTIN.

WAR DEPARTMENT,
Washington, November 1, 1918.

ALABAMA POWER CO.,
120 Broadway, New York City.

DEAR SIRS: I wired you early in the day that I shall be in New York on Monday for the purpose of further discussing with you and Mr. Burchard your proposed contract with the Government in relation to the supplying of electric energy to certain United States nitrate plants.

I acknowledge receipt of articles 24 to 36 of this contract, which you sent me under date of October 30.

I now send you the first 15 pages with a few minor changes, mostly in the interest of smooth reading. On the second line of article 11 I have replaced the single subdivision of article 3 therein referred to, by two subdivisions, as you will see. The reason for this is apparent. Subdivision 3 (formerly C) was inserted subsequent to the first draft of article 11 P. If you are in accord with these corrections I have to suggest that you have these pages written off in final shape. I should like to have as many copies as possible made, up to eight—this upon the assumption that all of them will be reasonably clear.

Respectfully,

WILLIAM WILLIAMS,
Lieutenant Colonel, Ordnance Department, United States Army.

Mr. QUIN. Under what statute do you interpret it that this work was carried on?

Mr. MARTIN. There were two statutes, Mr. Quinn, passed prior to the execution and delivery of the contract. It has seemed to us that either one of those statutes; or, in fact, both of them, are connected with the authority for the execution of this contract in behalf of the Government.

Mr. QUIN. The act of 1916, under which this work was authorized, was the one on which the work contemplated on the 1st of December, 1917, was begun in accordance with your understanding with the Government?

Mr. MARTIN. No.

Mr. QUIN. Then, what act was that?

Mr. MARTIN. The act of 1916 was never considered as in any way related to this work, Mr. Quin.

Mr. QUIN. Under what act of Congress, then, was your work of the 1st of December, 1917, begun?

Mr. MARTIN. I only know what was stated to me by the Ordnance Department officials to be their position, namely, that they were proceeding under certain provisions of the general statutes appropriating funds for armament of fortifications.

Mr. QUIN. What act is that? Will you put that in the record right here?

Mr. MARTIN. There are several of those statutes, and here is a memorandum relating to them, which, I understand, was the authority for this work.

Mr. QUIN. Will you put that into the record?

Mr. MARTIN. Yes, sir; I will be very glad to.

(The statement referred to follows:)

[65th Cong., 1st sess., ch. 29, 1917, p. 199, June 15, 1917, 40 Stat. L., 199.]

AN ACT Making appropriations to supply urgent deficiencies in appropriations for Military and Naval Establishments on account of war expenses for the fiscal year ending June 30, 1917, and other purposes.

"For purchase, manufacture, and test of ammunition for mountain, field, and siege cannon, including the necessary experiments in connection therewith, and the machinery necessary for its manufacture at the arsenals, \$367,000,000."

[Appropriations for fiscal year ending June 30, 1918, Oct. 6, 1917, 40 Stat. L., 367.]

"For purchase, manufacture, and test of ammunition for mountain, field, and siege cannon, including experiments in connection therewith, machinery for its manufacture, and the necessary storage facilities, \$663,000,000: *Provided* That the Chief of Ordnance, United States Army, is authorized to enter into contracts or otherwise incur obligations for the purpose above mentioned not to exceed \$777,182,750, as in addition to appropriations herein and heretofore."

"Appropriation for armored fortifications, \$80,725,000, passed March 28, 1918, in the same language, without the proviso as set out last above." (40 Stat. L., 482.)

"Appropriation of \$1,325,776,685, passed November 4, 1918 (40 Stat. L., 1019, at 1031), in the same language as last above for fiscal year ending June 30, 1919, including necessary experiments in connection therewith, the machinery necessary for its manufacture, and storage facilities," etc.

"Appropriation of \$2,000,000,000, passed July 8, 1918 (40 Stat. L., 871), practically the same language as for appropriation for fiscal year ending June 30, 1918.

"NOTE.—The above appropriations were by the act designated for ordnance. In this subdivision of the above-mentioned appropriations the acts carry with them other purposes for ordnance."

Mr. QUIN. All this money appropriated for fortifications for military purposes was money that was appropriated for military purposes?

Mr. MARTIN. Yes, sir.

Mr. QUIN. And if money was used out of that fund it was military money authorized by Congress?

Mr. MARTIN. Yes, sir.

Mr. STOLL. Mr. Martin, you are familiar with the act of 1916 that provided for these activities at Muscle Shoals by the Government?

Mr. MARTIN. Yes, sir; you refer to section 124 of the national defense act.

Mr. STOLL. The one that provided for the building of these plants and the development of Muscle Shoals.

Mr. MARTIN. I am familiar with that section of the act, Mr. Stoll.

Mr. STOLL. Under this section that says, "The plant or plants provided for under this act shall be constructed and operated solely by the Government, and not in conjunction with any other industry or enterprise carried on by private capital," do you think the Ordnance Department with that provision of law had any authority to make a contract with you to carry on these activities there?

Mr. MARTIN. That section of the act was not the authority under which those officers proceeded. Secretary Baker has testified to that effect before one of the committees of Congress, Gen. Williams has so testified, Col. Burns has so testified, and Col. Joyes has so testified, the officers of this Government who were directly responsible for this work. That was their treatment of the question throughout with us. Now, that is as far as I can answer the question.

Mr. STOLL. I did not ask you what they thought about it, but what you, as a lawyer, thought. What was that put in that act for?

Mr. MARTIN. I do not know; only I never understood that act had anything to do with this question. The money did not come from that source at all.

Mr. STOLL. What does this refer to, then?

Mr. MARTIN. The President was given the authority from Congress to designate certain plants that should be erected for the purposes of that act.

Mr. STOLL. This is a part of the act that provided for the activities at Muscle Shoals.

Mr. MARTIN. For those activities designated by the President.

Mr. STOLL. But I say this is a part of the act.

Mr. MARTIN. Part of section 124 of the act; yes, sir.

Mr. STOLL. And you say that they just ignored that entirely?

Mr. MARTIN. No, sir; I say this whole question we are considering was never considered as in any way having anything to do with that section 124.

Mr. STOLL. Why not?

Mr. MARTIN. Because of the very nature of the situation. The President did not designate Gorgas as a part of that nitrate plant. The President never initiated the authority under that act so far as it related to Gorgas. The whole authority under which the Ordnance Department proceeded—

Mr. STOLL (interposing). The transmission line leads right into plant No. 2, does it not?

Mr. MARTIN. Yes; so it does.

Mr. STOLL. Was not that designated by the President?

Mr. MARTIN. Plant No. 2?

Mr. STOLL. Yes.

Mr. MARTIN. I think not.

Mr. STOLL. What was designated by him?

Mr. MARTIN. Plant No. 1 and the Wilson Dam, according to my understanding.

Mr. STOLL. Your contention is that this had nothing to do with what the President designated?

Mr. MARTIN. Yes; and that was the treatment of it by the Government officials from the Secretary of War down, throughout. No one ever discussed it upon that theory. No one ever discussed the legal status that might arise by virtue of that act, whether they were law officers or not. No one ever considered it had anything to do with the question.

Mr. STOLL. Did you consult your attorneys in that respect or relative to that question?

Mr. MARTIN. I do not know that we ever discussed the question. I do not recall that we discussed it.

Mr. STOLL. You just ignored that section?

Mr. MARTIN. Because it had nothing to do with the question. The officers of the Government were not proceeding under that section.

Mr. GARRETT. Mr. Martin, who were your attorneys during the time of the negotiation of this contract?

Mr. MARTIN. I was general counsel for our company.

Mr. GARRETT. You were, yourself?

Mr. MARTIN. Yes.

Mr. GARRETT. Are you the general counsel now?

Mr. MARTIN. Yes; I am president and general counsel. I do not have very much time to devote to the legal side of our work, but I am still general counsel.

Mr. GARRETT. Then, the company was being advised by you?

Mr. MARTIN. Yes, sir.

Mr. GARRETT. As to whether it had—

Mr. MARTIN (interposing). And we had other counsel who came in at different times in this situation; for instance, Mr. Niel A. Weathers.

Mr. GARRETT. Who is he?

Mr. MARTIN. He is a lawyer who has been connected with us for many years.

Mr. GARRETT. Where does he live?

Mr. MARTIN. In New York.

Mr. GARRETT. Did you have any Alabama lawyers?

Mr. MARTIN. None outside of our own legal staff.

Mr. GARRETT. Is the Alabama Power Co. a New York corporation?

Mr. MARTIN. No, sir.

Mr. GARRETT. Or an Alabama corporation?

Mr. MARTIN. An Alabama corporation.

Mr. GARRETT. Where is its headquarters?

Mr. MARTIN. In the city of Birmingham.

Mr. GARRETT. Why was this contract executed in the city of New York if you had your headquarters in Birmingham?

Mr. MARTIN. It was because the Government officials who were conducting it were living either in Washington or New York, and the president of the company at that time lived in New York.

Mr. GARRETT. Did you not testify here two days ago that your minutes were prepared and this authority given your directors at a meeting in New York?

Mr. MARTIN. That is correct, Mr. Garrett. This meeting was held on the 4th of November in the city of New York. Our company has been authorized to transact business in the State of New York.

Mr. GARRETT. Where did you get that authority?

Mr. MARTIN. By complying with the laws of New York. We have an office in New York.

Mr. GARRETT. You have a branch office of the Alabama Power Co. in New York?

Mr. MARTIN. Yes.

Mr. GARRETT. Where are your minutes kept, in Alabama or in New York?

Mr. MARTIN. They are kept, an original in one place and a carbon in the other.

Mr. GARRETT. Where are the originals kept?

Mr. MARTIN. In Alabama.

Mr. GARRETT. And the carbons are kept in New York?

Mr. MARTIN. Yes.

Mr. GARRETT. What was there at Muscle Shoals before the erection of Dams Nos. 1 and 2 or before any activity on the part of the Government for war purposes; what physical properties were at Muscle Shoals before that time?

Mr. MARTIN. Before the nitrate plants were begun in 1917?

Mr. GARRETT. Yes.

Mr. MARTIN. I do not know of any properties that the Government had except its navigation canals, in connection with the Muscle Shoals.

Mr. GARRETT. Was there any other power plant there at that time?

Mr. MARTIN. Yes; there was a power plant and distribution system serving those communities of Sheffield, Florence, and Tusculmbia.

Mr. GARRETT. That plant was at Muscle Shoals.

Mr. MARTIN. Yes.

Mr. GARRETT. Where was that located?

Mr. MARTIN. I do not know. We have no connection with it.

Mr. GARRETT. Where is this power plant located with reference to Dam No. 2?

Mr. MARTIN. I do not know where that plant is located. There is a steam plant located in the city of Sheffield, as I understand it, some two miles from that plant, so our engineer says.

Mr. GARRETT. There is no water-power plant there?

Mr. MARTIN. No, sir.

Mr. GARRETT. There was nothing of that kind at Muscle Shoals before the Government began this activity?

Mr. MARTIN. That is my understanding.

Mr. GARRETT. Then, there was nothing at Muscle Shoals, either steam or power plants, or any other activity, before the Government began this project of establishing nitrate plants.

Mr. MARTIN. There was a steam plant and distribution system supplying the needs of those communities for water and power.

Mr. GARRETT. You mean at Muscle Shoals?

Mr. MARTIN. Muscle Shoals, you understand—

Mr. GARRETT. I mean anywhere in the neighborhood of Plants 1 or 2.

Mr. MARTIN. Yes, sir; Dam No. 2 is in the corporate limits, I believe, of those communities. Florence is on one side and Sheffield on the other, and Dam No. 2 is in the corporate limits of one of those towns and possibly both, although I am not certain.

Mr. GARRETT. That was a steam-power plant?

Mr. MARTIN. There was a steam-power plant entirely distinct, of course, from Muscle Shoals.

Mr. GARRETT. That is what I am getting at.

Mr. MARTIN. It was a steam-power plant owned by the Sheffield Co. which was engaged in the generation and distribution of light and power for those communities, and having a street railway system.

Mr. GARRETT. But you had no connection with any power plant there of any kind?

Mr. MARTIN. No, sir.

Mr. GARRETT. You now own or your company owns the abutment rights on Dam No. 2, do they not?

Mr. MARTIN. No.

Mr. GARRETT. On Dam No. 3?

Mr. MARTIN. Yes.

Mr. GARRETT. You do not own anything down at No. 2?

Mr. MARTIN. No; we conveyed that to the Government.

Mr. GARRETT. How much did you own there that you conveyed to the Government?

Mr. MARTIN. I do not recall. We had some acreage there and we had the abutting sites at Dam No. 2 together with some of the flowage lands and we conveyed that to the Government for \$1.

Mr. GARRETT. How long did you own that? When did you acquire it?

Mr. MARTIN. Some of those lands were acquired—they were acquired at different times between 1906 and 1915, at various times; I could not tell you without looking at the records.

Mr. GARRETT. What was your purpose in acquiring those lands if there was nothing over there at that time?

Mr. MARTIN. With the idea of water-power development, of course.

Mr. GARRETT. You intended to develop that at some future day?

Mr. MARTIN. Absolutely.

Mr. GARRETT. And that was your idea in acquiring this land?

Mr. MARTIN. Yes, sir.

Mr. GARRETT. Who was the first person that suggested to the Alabama Power Co. about the extension of your transmission line over there to the nitrate plant?

Mr. MARTIN. As I understand, the subject came up through conference between Gen. Crozier and Mr. Washburn.

Mr. GARRETT. Mr. Washburn?

Mr. MARTIN. Yes. Mr. Washburn was the president of the Cyanamid Co., which had the patents and methods for making air nitrates. The question was one of obtaining power in the event the Government should locate a nitrate plant at Sheffield.

Mr. GARRETT. Did not your corporation, the Alabama Power Co., write a letter to the War Department making inquiry as to the development of this property and the desirability of its development?

Mr. MARTIN. No.

Mr. GARRETT. And upon that letter—

Mr. MARTIN (interposing). No; it was this way, Mr. Garrett: Mr. Washburn and Gen. Crozier discussed the subject, and Gen. Crozier asked Mr. Washburn to get in touch with us and to have furnished to some official of the Government such data as we cared to submit on the subject of a temporary power supply for the nitrate plant. Thereupon a letter was written by the Alabama Power Co. to Col. Joyes submitting various information and data.

Mr. GARRETT. That was concerning the power you already had developed?

Mr. MARTIN. Yes; concerning a supply of power from our system in Alabama to the nitrate plant to be located at Muscle Shoals.

Mr. GARRETT. Have you that correspondence?

Mr. MARTIN. Yes; it is in the record.

Mr. GARRETT. I believe you just stated that Mr. Washburn was president of the American Cyanamid Co.?

Mr. MARTIN. That is correct.

Mr. GARRETT. And had formerly been connected with the Alabama Power Co.?

Mr. MARTIN. That is correct.

Mr. GARRETT. When did he sever his connection with the Alabama Power Co.?

Mr. MARTIN. He resigned all connection with this company in March, 1918.

Mr. GARRETT. How much stock did he own in the Alabama Power Co.?

Mr. MARTIN. He owned stock in our holding company. I think it was 1,000 shares.

Mr. GARRETT. I do not understand your answer. What do you mean by "holding company"?

Mr. MARTIN. That was the stock that was held by the public at that time. He held a thousand shares of stock in the company which controls this situation.

Mr. GARRETT. Did he have common stock or preferred stock?

Mr. MARTIN. Common stock.

Mr. GARRETT. What company is that which controls the Alabama Power Co.?

Mr. MARTIN. That is the Alabama Traction, Light & Power Co.

Mr. GARRETT. Where is that company located?

Mr. MARTIN. That company is domiciled in the Dominion of Canada.

Mr. GARRETT. Does not that company own the common stock of the Alabama Power Co.?

Mr. MARTIN. It does.

Mr. GARRETT. And does not the common stock control the Alabama Power Co.?

Mr. MARTIN. Yes.

Mr. GARRETT. Then, the Alabama Power Co. is controlled by this Canadian corporation?

Mr. MARTIN. Yes; but as I stated to you, the stock holdings of this Canadian company are largely held in America now. As a result of the war in Europe in 1914 there has been an entire change in the security status situation in our company, and the largest blocks of stock are held in America to-day, and the largest single block of stock is held in Alabama by citizens of Alabama.

Mr. GARRETT. Is that common or preferred stock?

Mr. MARTIN. Preferred stock, and all the preferred stock of the Alabama Power Co. outstanding, of course, ranks *pari passu* with the common, and is all held in Alabama.

Mr. GARRETT. What did you say is the name of the Canadian corporation that owns this stock of the Alabama Power Co.?

Mr. MARTIN. The Alabama Traction, Light & Power Co. (Ltd.).

Mr. GARRETT. Does it not still own a majority of the stock?

Mr. MARTIN. It owns all the common stock of the Alabama Power Co.

Mr. GARRETT. And the common stock is the majority of all the stock, common and preferred?

Mr. MARTIN. Oh, yes.

Mr. GARRETT. Do you know whether Mr. Washburn owns any stock in the Canadian controlling corporation or not?

Mr. MARTIN. He does not now own any stock in it.

Mr. GARRETT. Did he ever own any of it?

Mr. MARTIN. He did, as I have stated to you.

Mr. GARRETT. He owned his stock in that company?

Mr. MARTIN. Yes.

Mr. GARRETT. One thousand shares?

Mr. MARTIN. Yes; 1,000 out of \$18,000,000. I would just like to say that for many years the Alabama Power Co.'s board of directors has consisted from time to time of varying numbers, but at the present time we have, as I recall, 12 directors, 10 of whom live in this country, and the majority of whom live in Alabama.

Mr. DENT. How many live in Alabama?

Mr. MARTIN. I think there are 7 of the 10 who are living in Alabama. The directors' meetings are usually held there, and all the policies of the company are fixed by this board and have always been fixed by this board.

Mr. GARRETT. The emergency officer who made the contract with your company was a New York lawyer, also, was he not?

Mr. MARTIN. Col. Williams.

Mr. GARRETT. Before entering the service?

Mr. MARTIN. Col. Williams was a New York lawyer; yes.

Mr. GARRETT. Do you know whether or not he owned stock in the Canadian corporation or the American Cyanamid Co.?

Mr. MARTIN. I know that he did not.

Mr. GARRETT. You know that he did not?

Mr. MARTIN. Yes.

Mr. GARRETT. Did you get that information from him?

Mr. MARTIN. No, sir. I never heard of his name and never knew the gentleman before he came into the situation, and I have heard nothing from him since he concluded the contract; but if he had had any stock, I would have known it. I would have heard something of it. Of course I can not speak of the Cyanamid Co. finally, but I never heard of his having any stock in it, and I do know he never had any stock in our company.

Mr. GARRETT. How long has your company maintained offices in New York?

Mr. MARTIN. We opened an office there, as I recall, in 1912 or 1913.

Mr. GARRETT. In 1912 or 1913?

Mr. MARTIN. Yes, sir.

Mr. GARRETT. And you have those offices now?

Mr. MARTIN. Yes, sir.

Mr. GARRETT. Who is in charge of them?

Mr. MARTIN. We have an assistant secretary in charge of them.

Mr. GARRETT. What is the purpose in maintaining those New York offices now?

Mr. MARTIN. Well, our banking relations are conducted in New York. We constantly must have touch with bankers to obtain funds with which to make our developments. All of our funds are raised in America and have been for many years, and we maintain that office as a matter of convenience, if not necessity, to keep in touch with our business relations in New York. Formerly Mr. James Mitchell was president of our company until his death two years ago, and lived in New York, and, of course, that was an additional reason.

Mr. GARRETT. Does anybody else occupy the New York office in conjunction with your company at this time?

Mr. MARTIN. Yes; there are two or three different concerns that occupy the office.

Mr. GARRETT. Have they any connection with any of these other corporations?

Mr. MARTIN. No; none at all.

Mr. GARRETT. Then as general counsel for the Alabama Power Co. and as its president you really are the one who drew this contract?

Mr. MARTIN. I was not president at that time. Mr. James Mitchell was president of the company.

Mr. GARRETT. You were the general counsel?

Mr. MARTIN. Yes; I was the general counsel.

Mr. GARRETT. At that time?

Mr. MARTIN. Yes.

Mr. GARRETT. And you were the one who drew this contract?

Mr. MARTIN. Well, in behalf of our company, I participated in working it out.

Mr. GARRETT. Now, just getting right down to between us boys, right across the table here, you are the man who wrote this contract out yourself, are you not?

Mr. MARTIN. No, sir; I am not.

Mr. GARRETT. Well, who did write it out?

Mr. MARTIN. The contract, naturally, was evolved from time to time from 1917 to its execution. You have got to go back to the beginning to get the fundamental basis of it.

Mr. GARRETT. I understand that, and am going back to the beginning, but you were operating there without any written contract executed.

Mr. MARTIN. That is right.

Mr. GARRETT. Until the 7th of November, and on the 7th of November you finally got this contract signed, and yet during all this time your company had been doing over \$5,500,000 worth of work that the Government was paying for.

Mr. MARTIN. Yes.

Mr. GARRETT. And it was all being done just simply by a common understanding after the 1st of December—

Mr. MARTIN. (Interposing). Just as hundreds of others were done, because we were doing a job of work and the question of contract, both to the Government officials and our company, was of less importance than getting the thing done that the Government officials wanted done.

Mr. GARRETT. Then, if you were perfectly willing to do all that without a contract up to the 7th of November, why did you not say, "We will leave it all to the Government until the end of it," and why did you come in and get your contract hurriedly signed in the State of New York away from the residence of your company?

Mr. MARTIN. It was not hurriedly signed in New York. The engagement was made to complete the contract before any question of the armistice came up. Col. Williams asked us to come to New York and execute it. That is where he was working, either in New York or Washington, and the armistice had nothing to do with it. Naturally, the contract relations had to be defined. It was of importance to the Government that it should have a contract. It was of importance to us that we should have a contract. If the Government had no contract with us by which we were to buy the property at fair value, the Government's only right was to remove the property from our land, and it was of great importance to the Government, of course, to have a contract.

Mr. GARRETT. I fail to see how much advantage or what the advantage of this contract is to the Government when they signed a contract there to construct five and a half million dollars worth of valuable property on your land and then agreed with you that you should be the only purchaser.

Mr. MARTIN. At a fair value. I will ask you this question, then: How was the Government going to adjust its rights with us if they had no contract and had erected fixtures on our land?

Mr. GARRETT. In the first place, you seem to forget, Mr. Martin, that the Government had a right at the time of the war to go down there and put this plant wherever it pleased, on your land or on anybody else's land, and to take your land for that purpose, if it wanted to?

Mr. MARTIN. I do not deny that at all.

Mr. GARRETT. It had a right to commandeer you and commandeer your power company.

Mr. MARTIN. Absolutely; and the Government could do it, of course.

Mr. GARRETT. But the Government, it seems, did not do that, but sent an emergency officer down there who made a contract, and you claim now that the Government is tied up—

Mr. MARTIN. (Interposing). No; I do not claim—

Mr. GARRETT. (continuing). So that it must sell this property to you at a fair value, whatever your fair value is, and if it does not do that it must tear down \$5,000,000 worth of stuff and move it somewhere else.

Mr. MARTIN. No, sir; the contract speaks for itself.

Mr. GARRETT. With what bank do you do business in New York?

Mr. MARTIN. We have accounts in two or three of the banks there.

Mr. GARRETT. In the National City?

Mr. MARTIN. No; we have no account with the National City.

Mr. GARRETT. Did you have during this time?

Mr. MARTIN. No.

Mr. GARRETT. Through what banks in New York did these Government funds pass?

Mr. MARTIN. I have not the slightest idea.

Mr. GARRETT. You do not know anything about that?

Mr. MARTIN. No, sir.

Mr. JAMES. Your minutes show that under date of November 9, 1918, Lieut. Col. Williams designated Col. Joyes to act in his place, do they not?

Mr. MARTIN. Our minutes?

Mr. JAMES. Yes.

Mr. MARTIN. No; I think there is a letter or memorandum attached to the contract, Mr. James. As I understood, that was after the contract was executed on the 7th of November, as I recall, and was made by Col. Williams, who surrendered in some formal way his connection with the contract to Col. Joyes. That is my recollection of it. It was explained to me that whatever authority he had in connection with it was passed along to Col. Joyes to administer.

Mr. JAMES. If the contract was signed on the 7th, why would there be a communication to you on the 9th?

Mr. MARTIN. There was no communication with us on the 9th, as I recall.

Mr. JAMES. Why would there be a communication from Col. Williams to Col. Joyes designating him as the contract officer two days after the contract was signed?

Mr. MARTIN. I think that was a formality in the Army circles of passing authority for either contracting or administering the contracts from one to another. I can not speak of that.

Mr. JAMES. I was wondering whether the contract was really signed on the 9th.

Mr. MARTIN. I think it was on the 7th, for the reason that that was the day, as I find on looking it up, of the false report of the armistice. Therefore I think it was the 7th on which the contract was executed. That is a matter that can be very easily verified from public information and from public records.

The CHAIRMAN. Mr. Martin, can you tell us what date the Dent Act was passed validating these various contracts?

Mr. DENT. Yes, sir; March 2, 1919. I have the act here, Mr. Chairman.

The CHAIRMAN. I just wanted to fix the date that law was passed because there was a great many contracts that the Government had entered into with private individuals; the officers for the Government or the private individuals failed to execute the contracts under the laws of the land, and it was held by the War Department that not having been properly executed, the parties could not be paid. Therefore, this law was passed so as to allow them to have the contracts executed, notwithstanding they had not been properly executed before the parties entered into the work.

Mr. MARTIN. That is it.

The CHAIRMAN. Your contract with the Government seemingly was also entered into because something had been left undone that should have been done to make the contract valid; is that your recollection?

Mr. MARTIN. There was no contract, Mr. Chairman, finally, no final meeting of the minds of the parties until this contract was signed in November. That is about the best way I can express it, I suppose.

The CHAIRMAN. As I understand you, you testified here that although the contract was entered into on the 1st of December, 1917, it was in the nature of letters that passed between your company and the officials of the War Department?

Mr. MARTIN. Now, Mr. Chairman, I have collected various letters and data since I was here the other day, and I would just refer to one or two of these things. I have in my hand a written memorandum dated December 3, 1917, by Col. Joyes.

The CHAIRMAN. He was the officer of the War Department.

Mr. MARTIN. Yes, sir. This memorandum is headed, "Suggested basis for contract between Alabama Power Co. and United States for power for Air Nitrates Corporation plant at Sheffield."

This is at the top of the memorandum, which I will hand to the reporter. It enters into various questions which, in substance, found their way into the contract. The concluding clause of the memorandum says:

"After June, 1921, or later date of cessation of United States' participation in present war, the United States owned transmission line and power apparatus and temporary building, etc., to be leased or sold to Alabama Power Co., if law permits and if satisfactory agreement on price, and if not, all property of United States to be removed within, say, six months from premises and right of way of Alabama Power Co. at United States expense, the Government to commandeer power from Alabama power system when necessary to deprive other customers in order to supply Government under any provision hereof."

You will note it says, "if law permits, and if satisfactory agreement on price," is agreed upon. Before any work was done that was the suggested basis.

Mr. GARRETT. Is that signed?

Mr. MARTIN. That is not signed.

The CHAIRMAN. You say that letter was sent or handed to you?

Mr. MARTIN. It was the result of a conference, Mr. Chairman, between Col. Joyes and our president, Mr. Mitchell. It was not signed, but reference was made to it in one or two of the letters which shortly followed from Col. Joyes to our company, directing us to construct the transmission line and to construct this Warrior extension.

The CHAIRMAN. To whom did Col. Joyes, or whoever was acting for the Government at that time, hand that letter?

Mr. MARTIN. To the Alabama Power Co.

The CHAIRMAN. Which one of the Alabama Power Co., or who representing the Alabama Power Co.?

Mr. MARTIN. Mr. James Mitchell represented the Alabama Power Co. as president, and I was present at some of the conferences as counsel.

The CHAIRMAN. Were you present when that letter was handed to the Alabama Power Co.?

Mr. MARTIN. I can not state I was present, specifically, but I think I was, Mr. Chairman. It has been so long ago—that has been five years now.

The CHAIRMAN. You say it was not signed by any representative of the Government?

Mr. MARTIN. No.

The CHAIRMAN. But you began to act on it?

Mr. MARTIN. Here is what happened on the 7th of December.

Mr. CROWTHER. I wanted to ask about that phrase which says "if the law permits." Did the law at that time permit?

Mr. MARTIN. It did not, and it is my understanding that there was no authority at that time, except his, that we understood there was some such provision.

On the 7th day of December there followed this order:

"ALABAMA POWER CO., *Birmingham, Ala.*:

"By authority of the Chief of Ordnance you are hereby given an order to construct"—

The CHAIRMAN. Pardon me; that was on December 7?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. That would be December 7, 1917?

Mr. MARTIN. That is correct, Mr. Chairman. It says:

"By authority of the Chief of Ordnance you are hereby given an order to construct on lands owned by you or rights of way under your control from your steam-power plant on the Black Warrior River to the site of the proposed ammonium nitrate plant of the Air Nitrates Corporation at Sheffield, Ala., for the present known as the United States Nitrate Plant No. 2, a transmission line for the purpose of, and of proper capacity for transmitting electric current of 3-phase, 60 cycle, and about 110,000 volts. This line to be built as economically as possible, being for the temporary use of the United States in transmission of power during the period of the present war, or thereabouts. The line to be the property of the United States, and suitable arrangements to be made as already tentatively agreed upon to cover the payment of actual cost plus a percentage thereof, to cover use of Alabama Power Co.'s lands, right of way, construction forces, and other facilities, etc., and profit. All these conditions to be embodied in a future contract.

"Priority Class A-1 has been requested from the War Industries Board for the manufacture of this material, copy of which is inclosed, so that delivery may be made at the earliest possible date.

"Although this writing is in letter form, please book it as a definite order on behalf of the Ordnance Department, United States Army, by the undersigned, and promptly acknowledge receipt thereof."

That was signed by Col. Joyes under date of December 7, 1917. We accepted that.

The CHAIRMAN. You accepted it?

Mr. MARTIN. Yes; our company under date of December 7, acknowledged receipt of that order and said, "In accordance with your instructions, we are proceeding to book this order as a definite order on behalf of the Ordnance Department, United States Army, and will proceed as speedily as possible toward carrying out your instructions."

The CHAIRMAN. As I recall your reading, the line was to belong, or the work you were to do there was for the United States Government, and it was to belong to the United States Government.

Mr. MARTIN. That is correct. Mr. Charman, on land or sites that are owned by us or under our control.

The CHAIRMAN. You accepted that and proceeded?

Mr. MARTIN. We accepted that and proceeded, yes. On the 7th of December there was issued another order to us.

The CHAIRMAN. December 7, 1917?

Mr. MARTIN. Yes; the same date. This is headed "Purchase order on:" It says:

"ALABAMA POWER Co.,

" *Birmingham, Ala.*

"By direction of the Chief of Ordnance you are hereby given an order to furnish certain electric power as specified hereafter to the United States Nitrate Plant No. 2 being constructed for the United States at Sheffield, Ala. (Muscle Shoals), by the Air Nitrates Corporation of New York, viz:

"Upon completion of the transmission line from your Warrior plant to the United States Nitrate Plant No. 2, at Sheffield, expected to be by or soon after June 1, 1918, which you are to construct under my order XOT-154, you to furnish from any resources of your system a guaranteed 10,000 kilowatts and as much more as may be available without interfering with your present signed customers, or requiring operation of the Birmingham steam plant, and as the United States may require, at certain rates tentatively agreed upon and to be embodied in contract to be signed directly.

"Also, upon completion of the addition to your Warrior steam plant to be built by you for the United States, as per contract to be signed directly and as covered by my order XOT-155, which completion is expected to be about August 1, 1918, you to furnish from said Warrior steam plant as a whole, including your present plant and the United States temporary additions thereto, on the basis of an equitable division of the cost of operating that plant, a firm quantity of 35,000 kilowatts or so much thereof as may be needed by the United States, undertaking to assure this quantity of power by your power resources other than the Warrior steam plant, the conditions of such assurance and of the basis of distribution of costs to be more particularly set forth in contract now tentatively agreed upon and to be signed directly.

"Priority Class A-1 has been requested from the War Industries Board for the electrical power (copy of which is inclosed).

"Although this writing is in letter form, please book it as a definite order on behalf of the Ordnance Department, United States Army, by the undersigned and promptly acknowledge receipt thereof."

That was on the 7th of December.

The CHAIRMAN. That was another case where you were to do certain things for the Government of the United States?

Mr. MARTIN. Yes, sir; which we accepted.

The CHAIRMAN. And you proceeded to carry that out?

Mr. MARTIN. Yes, sir; we carried it out.

The CHAIRMAN. Did the Government of the United States take possession of these things?

Mr. MARTIN. They had officers there who were directing what was to be done under this contract, but we proceeded in accordance with Col. Joyes's order.

The CHAIRMAN. Col Joyes in this communication said you were to do these things for the United States Government?

Mr. MARTIN. Yes.

The CHAIRMAN. He did not say you were to do them for the Alabama Power Co., but you were to do them for the Government of the United States?

Mr. MARTIN. Yes.

The CHAIRMAN. And you proceeded to carry that out?

Mr. MARTIN. We proceeded to carry that out. On the 7th of December, the same date there was the third of these purchase orders which had to do with this Warrior extension, in the same phraseology, substantially, as those which I have already read. That order says:

"ALABAMA POWER CO.,

"Birmingham, Ala.:

"By direction of the Chief of Ordnance you are hereby given an order to procure and install for the United States as a temporary addition to the steam-power producing facilities at your Warrior River plant in Alabama, and to enable you to supply to the United States nitrate plant No. 2, being constructed at Sheffield, Ala., by the Air Nitrates Corporation for the United States, the supply of power contemplated by a separate purchase order XOT-156 of even date herewith, as follows:

"1. Thirty-five thousand kilowatt turbo-generator unit, with suitable accessories, as condensers, switchboards, battery of boilers, etc., directly necessary to its service, and such auxiliary accessories as may be needed in addition to what you now have installed, or should properly put in for the portion of your plant now existing, which may be necessary for the operation of this plant as a whole, and approved by the undersigned.

"2. Spare turbo-generator, of approximately 35,000 kilowatts, as above, with the necessary accessories, not including steam-producing equipment, as may be necessary to enable this unit to take the place of the first unit mentioned above, in the event of temporary unserviceability thereof, as recommended by you and approved by the undersigned.

"Also to install the foregoing upon your existing land and foundations, etc., and to erect thereover a temporary building for the production of such apparatus.

"Provided, That all of the foregoing work is to be performed by you on the basis of reimbursement of actual cost, plus a construction fee in consideration of which you will allow without special rental or similar charges therefor, the use of your land, foundations, and other property as needed—all such conditions to be embodied in a contract now tentatively agreed upon and to be signed directly.

"Priority Class A-1 has been requested from the War Industries Board for the construction of this temporary addition to power plant (copy of which is inclosed).

"Although this writing is in letter form, please book it as a definite order on behalf of the Ordnance Department United States Army by the undersigned, and promptly acknowledge receipt thereof."

The CHAIRMAN. That, again, I take it, contained instructions to your company to build a transmission line for the Government of the United States?

Mr. MARTIN. This says, "by direction of the Chief of Ordnance, you are hereby given an order to procure and install for the United States as a temporary addition to the steam power producing facilities at your Warrior River plant in Alabama, and to enable you to supply to the United States nitrate plant No. 2 being constructed at Sheffield, Ala., by the Air Nitrates Corporation for the United States, the supply of power contemplated by a separate purchase order." The first one I read described the equipment.

The CHAIRMAN. You carried out that order?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. I understand the situation now.

Mr. WUEZBACH. Mr. Martin, I understand that it was your impression that the law of 1916, the national defense act, did not carry with it any authority to enter into the contract that was signed on November 7, 1918.

Mr. MARTIN. I said that the work was not initiated under section 124 of the national defense act.

Mr. WUEZBACH. Did you not also state, and will you not state now, that it is your opinion as a lawyer that that law of 1916 did not give any authority for this contract, which you are claiming under?

Mr. MARTIN. Yes; the law of 1916 did not have anything to do, one way or the other, with this question.

Mr. WURZBACH. You knew that in 1917, when you first began this matter?

Mr. MARTIN. Yes, Mr. Wurzbach. This whole question of authority was, as we understood, held in abeyance. The only law which had to do with this question was an act of 1892, under which the Secretary of War might make temporary leases of Government property. But when it came to authority for carrying out this work it was under certain provisions of acts of Congress making appropriations for armament and fortifications. Col. Joyes took the position that under that there was the authority for doing this work and there was the appropriation for paying for it, as I understood it.

Mr. WURZBACH. But I am asking you as a lawyer, and as counsel for the Alabama Power Co., this question: You yourselves recognize that there was no legal authority for this contract that was later signed in November, 1918?

Mr. MARTIN. To this extent, that at that time Congress had not conferred the power, as we understood it, upon the executives of the Government to dispose of property created during the emergency. That was the status of it at that time. Later, as we see it, two acts of Congress were passed—

Mr. WURZBACH. I want to come to those acts a little later. Exclusive of the acts of May, 1918, and July, 1918—exclusive of those two acts, and keeping in mind only the existing law, in December, 1917, you, as a lawyer, recognized that there was no authority for entering into this kind of contract that was later signed in November, 1918?

Mr. MARTIN. No; I will go this far with that: I recognized, as a lawyer, that there was no authority in the Government to agree to sell that which was created. There was authority in the Government, first, to go and create that which was necessary to supply its armament of its fortifications, and that was the theory on which Col. Joyes proceeded.

Mr. WURZBACH. It is not that feature of the contract, as pointed out by the chairman of the committee, that we are referring to. I am referring to the provisions in the contract under which you are claiming, that were supposed to put obligations on the Government that you are claiming under. I recognize the right to order certain work in the military department. But in reference to the giving of your company an option which you are now claiming under, you recognize that there was no law in December, 1917, authorizing that kind of a contract.

Mr. MARTIN. On that, Mr. Wurzbach—as I read to you in the very initial draft of this contract by Col. Joyes, he so expressed it, and all along it was treated in this light, that if the law permitted the property to be disposed of, as proposed at first. Later on this provision arose—

Mr. WURZBACH (Interposing). In May and July, 1918?

Mr. MARTIN. In May and July.

Mr. WURZBACH. I will ask you this question first: Knowing that, did you not have in mind, as the attorney for the company, the necessity for further legislation making this agreement legal?

Mr. MARTIN. I did not give any consideration to that, because it was just the natural discussion of the subject at that time that Congress would have to pass legislation of some character because this was one of thousands of cases, which you will find on examining the records of your committees, which came up. There were hundreds and hundreds of contractors for equipment, concerns who manufactured all kinds of equipment, who proceeded in the same way, erecting property for the account of the Government on their own lands.

Mr. WURZBACH. You knew the necessity for further legislation in order to protect your rights or your equity?

Mr. MARTIN. Of course, it was necessary for further legislation if we were to buy the property, but the Government also agreed in this initial memorandum, or Col. Joyes proposed in this initial memorandum, that if the law did not permit the Government to sell it to us, then the Government would remove the property from our lands, because we could not agree to sell the lands without destroying our plant. We were perfectly willing to agree to buy on the demand of the Government, and Col. Joyes recognized the fairness of the Government agreeing to remove the property if the Government did not sell it to us.

Mr. WURZBACH. I think you stated that the biggest part of the work was completed in about five months after you started the construction of the transmission line?

Mr. MARTIN. The transmission line was completed and in operation in the early part of May, 1918. The turbo-generator and the other facilities at the

Warrior extension were completed toward the end of the year. But meantime we supplied the power requirements of the Government over this line from our system pending the completion of the Warrior extension. That was the order Col. Joyes gave us.

Mr. WURZBACH. The main part of this work was completed before these acts of Congress of May and July, 1918?

Mr. MARTIN. No; the transmission line represented about one-fifth of the total cost, but I should say probably 40 per cent of it was completed when these acts were passed.

Mr. WURZBACH. Did you know when this legislation was enacted? Were you in touch with any Member of Congress with reference to this legislation?

Mr. MARTIN. No. The only thing I knew about the legislation was after it was passed in August. Capt. Noble handed me a copy of a general order issued by Gen. Goethals which I have read into the record, and which I understood was founded on these acts of Congress. That was an order, or a bulletin, rather, issued by Gen. Goethals.

Mr. WURZBACH. You did not find that out until August, 1918?

Mr. MARTIN. August, 1918.

Mr. WURZBACH. You testified in response to questions just asked you by the chairman of the committee with reference to certain letters that were considered by you as part of the contract which was later signed in November, 1918.

Mr. MARTIN. These work orders which I have referred to were issued to us and formed the basis upon which we proceeded.

Mr. WURZBACH. Under which you proceeded to do certain work for the Government. Have you any correspondence covering any of the other provisions of the contract as it was finally signed?

Mr. MARTIN. I have a lot of correspondence here, probably 50 sheets of it, and they do cover various features of it.

Mr. WURZBACH. Do they refer to the compensation this company was to receive?

Mr. MARTIN. I have not been over the correspondence to see, but I have filed it with the reporter.

Mr. WURZBACH. Do they refer to the provisions of the contract with the Government that gave you authority to buy this property from the Government at a fair price?

Mr. MARTIN. I do not recall. I suppose they do refer to that question in some form, of course.

Mr. WURZBACH. All of the provisions of the contract were verbally agreed upon, or you had some correspondence about them before November 7, 1918?

Mr. MARTIN. Yes; I think it might be considered in that way. It is a question where different officers had different ways of expressing it. Capt. Noble had one way of writing the contract and Col. Williams had an entirely different way. When he came into it he redrafted the contract. Capt. Noble had put it into two contracts, one for construction and one for operation, and Col. Williams entirely changed the theory of the contract and made an entirely new contract. This is the contract which was signed.

Mr. WURZBACH. I suppose you had considerable correspondence with the legal representatives of the Government with reference to the drafting of this contract?

Mr. MARTIN. Yes; there was one as recent as November 1, 1918, inclosing certain parts of the contract, and another one—

Mr. WURZBACH (interposing). Have you included in that all the correspondence and the data which would throw any light on that?

Mr. MARTIN. Here is another of October 19.

Mr. WURZBACH. Together with copies of letters which you read?

Mr. MARTIN. Yes, sir.

Mr. MCKENZIE. Forgetting the contract for a moment, I want to ask you a few questions at this time, thinking perhaps I may not get another opportunity, in connection with the practical proposition with which we are confronted, having in mind that the Committee on Military Affairs, under the leadership of our chairman, has been endeavoring for months to aid the War Department in disposing of what we might call surplus property. I am going to assume in asking these questions that your company and you were animated at the time of this transaction by the highest and most patriotic motives, the country being in war, and assuming that you as an American citizen are still so animated, so far as the interests of our Government are concerned.

With that statement I want to ask you a few questions.

What was the cost of the plant? You testified to that, but I want to get that here. What was the cost of the plant at Gorgas?

Mr. MARTIN. The Government extension?

Mr. McKENZIE. Outside of the transmission line. If you have not those figures here you can insert the cost in the record.

Mr. MARTIN. It is contained in the Secretary of War's memorandum, which he has filed.

Mr. McKENZIE. It was something over \$3,000,000, was it not?

Mr. MARTIN. Yes.

Mr. McKENZIE. And the cost of the transmission line was about how much?

Mr. MARTIN. The cost of the transmission was \$605,000.

Mr. McKENZIE. The cost of the plant was between three and four million dollars?

Mr. MARTIN. Yes.

Mr. McKENZIE. That work was carried on under very abnormal conditions, and we all understand that.

Mr. MARTIN. Yes.

Mr. McKENZIE. It was a cost-plus contract proposition. What would you say would be a fair discount from that sort of cost to a normal cost?

Mr. MARTIN. As I stated on Friday, one of our engineers has stated that the present cost of reproduction is about 70 per cent of the cost in 1918.

Mr. McKENZIE. About 70 per cent?

Mr. MARTIN. Yes.

Mr. McKENZIE. Do you think that would be a fair estimate; is it your judgment that there was not more than 30 per cent wasted in extravagance during the war in the construction of these various plants?

Mr. MARTIN. I would not like to put it in that form.

Mr. McKENZIE. I mean under the conditions that seemed to be necessary, it seems to me 30 per cent would be a very fair estimate of the extra charge. I have been under the impression it was more than that—perhaps 40 per cent.

Mr. MARTIN. You can not call 30 per cent wastage, for you must remember there was an abnormal price level during that time, and we worked under military supervision; that we had guards at the plant, that we had the 8-hour labor law, that we had the holidays to consider; we had all the incidents of governmental supervision and work.

Mr. McKENZIE. I had all of that in mind.

Mr. MARTIN. As to what enters into that 30 per cent—

Mr. McKENZIE (interposing). I wanted you to take that into account, to keep in mind, or to consider in your statement the very liberal amount that would be what we might call an overcharge over what it would cost in ordinary normal times.

Mr. MARTIN. To reproduce that plant to-day under present price levels, you could probably reproduce it for 70 per cent of the cost in 1918; that is, under private operation, under private construction, without Government supervision, as a private, going concern that knew its business.

Mr. McKENZIE. Without the connection with Muscle Shoals the transmission line beyond the town of Jasper, I take it, would be of little use to your company?

Mr. MARTIN. Mr. McKENZIE, we have this situation: We have a large power distribution in the northern section of Alabama in the Huntsville and Decatur districts; we have a single line serving them from the eastern section of our State from a point known as Gadsden, and the public service commission of our State has been endeavoring for a long time to get us to furnish in some way a duplicate service to these two districts, and we have stated to them we hoped to work out that duplicate service over this transmission line from Warrior to Sheffield and over to Decatur. It will add very substantially to that public service if we can work that out, and it has been our purpose, if we can work out an arrangement with the Government to have this duplicate service for the northern part of Alabama.

Mr. McKENZIE. It would be of value to your company?

Mr. MARTIN. It would be of value to our company, and it is a matter that has come up many times with the public-service commission of the State.

Mr. McKENZIE. Now, Mr. Martin, your company is engaged in the manufacture and production and sale and transmission of this current over that section of the State of Alabama?

Mr. MARTIN. Yes.

Mr. McKENZIE. And your corporation, as I understand it, is a going one, and at Gorgas you had laid the foundations for a much larger plant than you had

at the time of the breaking out of the war, having in mind the development and increase of your business; is that not true?

Mr. MARTIN. That is true.

Mr. McKENZIE. Now, I want to ask you, having in mind the Government's desire to dispose of this property, having in mind what it would cost to replace that property, having in mind your desire, as an American citizen, to be fair with your Government, I want to know, if you are willing to state it—and your company realizing that this is tangible property, valuable to you, whether or not you would be willing to pay to the Government at this time, when we are undertaking to unload many of these things we have no immediate necessity for, 70 per cent of what this plant cost? I am not talking about the contract; I am not talking about the connection of Mr. Ford or anybody else. I am just talking to you as the representative of this great corporation, dealing with the Government, having here a piece of property that has a value to you.

Mr. MARTIN. Yes; it has a value to us.

Mr. McKENZIE. Bearing in mind the equities and the endeavor to do justice, would your company be willing to take over this plant at 70 per cent, or 60 per cent—and I have had so much experience in investigating cost-plus contracts that I would be willing to say right off if you took off 40 per cent you perhaps would not be far out of the way—would you be willing to give the Government 60 per cent of what the Government has invested there, which would be for your benefit?

Mr. MARTIN. Mr. McKenzie, you must bear this in mind: We have a contract—

Mr. McKENZIE (interposing). I am forgetting that contract.

Mr. MARTIN. Can we forget it, when we are here under an agreement to purchase the property at a fair value, to be established by arbitration?

Mr. McKENZIE. Would not that be a fair value?

Mr. MARTIN. If the arbitrators set up that value, of course, we would have that value.

Mr. McKENZIE. You are a business man.

Mr. MARTIN. I feel that question is one which now must be settled by arbitration. You and I are not arbitrating the price at which this property would be taken over. If we were arbitrating the case we could bind the Government and the company to do a certain thing. But we can not. You are asking a question which goes right to the performance of the arbitration part of the contract. But we are willing to—

Mr. McKENZIE (interposing). The question gets right down to brass tacks.

Mr. MARTIN. We will carry out the contract, whatever the price set by the arbitrators may be. Furthermore, you have raised that question, and it is also involved in the proposition we have made to the Government as bearing on the whole situation.

Mr. McKENZIE. I am asking these questions because we do not know what is going to be the outcome of this proposition. But I did think that perhaps you might be willing to make a statement, as a business man, that would get away from that haze and that mist which you involved this proposition in by speaking of a fair value. I think it has been brought out in these hearings that this property has absolutely no value to anybody except the Alabama Power Co.

Mr. MARTIN. It has a fair value to us. The value it has to us is different from the junk value; it is a fair value which not every competent man can settle, and that is the basis on which we have agreed to take it. I would not like to express in dollars exactly what that would be in our judgment, because it is naturally one for these arbitrators to settle.

Mr. McKENZIE. I can not speak for the Government; I am only one citizen.

Mr. MARTIN. That is true, and if the Secretary of War is given the authority to speak for the Government we will deal with him.

Mr. McKENZIE. I can not bind the Government, but viewing this situation as I do I would be glad to enter into some proposition to sell this property to you if I had the power, if you showed a disposition to pay for it what is right and fair.

Mr. MARTIN. We certainly have a disposition to pay that which is fair, because we are under contract to do it.

Mr. McKENZIE. I wish you would think about that 60 per cent proposition.

Mr. STOLL. In case the Government should let you have this property according to your contract, have you any set-offs against the Government?

Mr. MARTIN. Set-offs?

Mr. STOLL. Yes.

Mr. MARTIN. No.

Mr. STOLL. Under the contract?

Mr. MARTIN. No; not growing out of this at all. We have \$1,000,000 more or less of investment and expenses, but it is not our purpose to make any claims on that.

Mr. STOLL. Under these sections 19 and 22, is not some set-off contemplated there?

Mr. MARTIN. I do not know of any set-off we have.

Mr. JAMES. In response to a question by Mr. Crowther, you said there was no law at that time but you were told there was going to be legislation to take care of it.

Mr. MARTIN. That was the general feeling among the officials, that this question was to be taken care of in some way.

Mr. JAMES. Who told you there was going to be legislation to take care of that?

Mr. MARTIN. I can not say that there was any declaration. It naturally came up in discussion with Col. Joyes, because the very words of his letter, "if the law permits," would naturally provoke a discussion in regard to that particular matter.

Mr. JAMES. Did Col. Joyes ever intimate to you that there was going to be legislation along those lines?

Mr. MARTIN. He assumed there would be.

Mr. JAMES. Did he tell you that there would be?

Mr. MARTIN. That is my impression.

Mr. JAMES. Did Col. Williams tell you that also?

Mr. MARTIN. No; Col. Williams came into it after the legislation was passed. Capt. Noble was the first law officer of the Government to handle it, and he handled it until his death. He died after these acts were passed.

Mr. JAMES. You did not know anything about those acts?

Mr. MARTIN. No. Capt. Noble handed me a memorandum—

Mr. JAMES (interposing). When?

Mr. MARTIN. In August, 1918, which I think was taken from one of the official Government reviews in Washington, containing Gen. Goethals's order, which, as I understood, was founded on these acts. It does not refer to them in terms but was founded on these acts, and Capt. Noble and I discussed the effect of that order, and it was his view that it was made with reference to these two acts of Congress. That was in August, 1918. The bulletin issued by Gen. Goethals is in your record.

Mr. JAMES. This legislation was passed in May and July. Was that legislation along the same line that Col. Joyes spoke to you about?

Mr. MARTIN. I can not say that Col. Joyes spoke about any specific legislation.

Mr. JAMES. He told you there would be legislation to take care of you, to validate the contract?

Mr. MARTIN. No; to take care of the general program of the Government. It was not only in our case, but there were numerous concerns that were doing that kind of work. There were transmission lines, connections between different lines built in the State of Ohio, and there was an extension at Pittsburgh, another at Cleveland, and another at Cincinnati. There were any number of situations of that kind. So that, considering the circumstances, it was simply one of those natural assumptions that if the Government created property on land of others some way was bound to be worked out by which the Government would salvage that property. But as to the form which the legislation would take, we did not have any idea.

Mr. JAMES. I understood you to say the other day that you did not know who the authors of the bills passed in May and July were?

Mr. MARTIN. No; I did not know anything about it.

Mr. JAMES. You understood they were riders on appropriation bills?

Mr. MARTIN. I have understood that since.

Mr. JAMES. Do you know who the author of the amendments was; did you ever look it up?

Mr. MARTIN. No.

Mr. JAMES. Did Mr. Dent look it up for you?

Mr. MARTIN. No.

Mr. DENT. I can explain that, Mr. James, when I make my statement.

Mr. FIELD. If I have understood you correctly, you entered into this contract, practically every phase of it, before this legislation was enacted?

Mr. MARTIN. Yes; through work orders and memoranda and letters; substantially the whole proposition was agreed upon.

Mr. FIELDS. In letters and work orders?

Mr. MARTIN. Yes.

Mr. FIELDS. And you discussed with Col. Joyes and among yourselves the desirability of legislation to legalize the several phases of this agreement?

Mr. MARTIN. I can not say that my discussion rose to the dignity of saying it was desirable to pass this legislation. When we undertook to find a source of power, there was not a thing; and Col. Joyes says in his memorandum. "If the law permits," he would agree, in behalf of the Government, to dispose of the property. So those words "if the law permits" were put in there. Nobody could say then—nobody could possibly say—what it would be.

Mr. FIELDS. The question has been asked why the contract was not signed until the 7th day of November, 1918. Is it not a fact that the signing of the contract was deferred in the hope that legislation would be enacted that would legalize every phase of the contract?

Mr. MARTIN. No; because you see we had agreed to buy, if the Government demanded of us to buy, at a fair price. I can not say that the question of the lack of legislation delayed the contract the slightest. I do not think it delayed it an hour.

Mr. FIELDS. You stated awhile ago that it really was not a contract prior to November 7, 1918, in that there had not been a complete meeting of minds between the agent of the Government and the representative of the Alabama Power Co. How long did it take the agent of the Government and the representative of the Alabama Power Co. to effect a meeting of minds when they met in New York on the 7th day of November, 1918?

Mr. MARTIN. I assume before that time all those points had been disposed of, Mr. Fields.

Mr. FIELDS. Is it not a fact that they were disposed of—that is, all but the signing of it—at the time they were entered into, from time to time, by either verbal or written agreements?

Mr. MARTIN. As the matter progressed we agreed from time to time upon particulars all of the contract, of course.

Mr. FIELDS. All was done but the signing, which was, so far as the substance of the contract goes, but a matter of form?

Mr. MARTIN. As I have explained, Col. Williams redrafted this contract, and his last redraft came to me on the 1st of November, 1918.

Mr. QUIN. In response to a question this morning you said that the Alabama Traction, Light & Power Co. (Ltd.), holds all of the common stock of the Alabama Power Co.?

Mr. MARTIN. Yes.

Mr. QUIN. In response to my question the other day I understood you to say that the Alabama Traction, Light & Power Co. (Ltd.) owned 10 per cent of that stock?

Mr. MARTIN. You misunderstood me.

Mr. QUIN. And that 48 per cent of it is held in foreign countries. You stated that 10 per cent was held by the Canadian corporation and 48 per cent held in England, France, Belgium, and other countries.

Mr. MARTIN. You misunderstood me. The stockholdings of our company are represented in two classes, the common stock and the preferred stock.

Mr. QUIN. Was this preferred stock?

Mr. MARTIN. No; I will tell you what that was. We have some 15,000 or 20,000 shares of preferred stock outstanding of the Alabama Power Co., all of which is practically held in Alabama. That amounts to about \$2,000,000. We have, in addition to that, common stock amounting to about \$18,000,000, all of which is held by the Alabama Traction, Light & Power Co. (Ltd.). But now you must get at the stockholders of the Alabama Traction, Light & Power Co. (Ltd.) to see wherein the control and ownership lies. The stock of that company was originally held, the large majority of it, abroad, and since the war in Europe that stock has been sold and has come to this country in great volume, and the largest single holdings of that stock are in this country. For instance, in the State of Alabama, there is one single group of people who have the largest block of stock of any one. There is another group of people in this country who have a large group of holdings. It has been quite widely scattered and held since 1914. The very fact of that stock emanating from a company in Canada is not the only question you must look at, but where the stock is held.

Mr. QUIN. In an answer to one of my questions you said that 10 per cent was held by the Dominion of Canada corporation.

Mr. MARTIN. No; I said by stockholders living in Canada. There was something less than 10 per cent held by citizens living in Canada.

Mr. QUIN. And 48 per cent across the Atlantic, and that leaves 42 per cent in this country?

Mr. MARTIN. In this country.

Mr. QUIN. You stated that 63 per cent of the securities were held in this country and 37 per cent held abroad.

Mr. MARTIN. Of our total securities; that is about the story.

Mr. QUIN. What is correct? Is it correct to say that 58 per cent of the stock is held in Canada and abroad?

Mr. MARTIN. Something less than 58 per cent.

Mr. QUIN. That is preferred stock?

Mr. MARTIN. No; that is all common.

Mr. QUIN. You stated to Mr. Garrett that all of the common stock was held by this Dominion of Canada corporation.

Mr. MARTIN. But what I am speaking of is the stock of the Canadian company. This stock has been widely distributed in this country, and that is the question you must look to. Of course, that is not—

Mr. QUIN. (Interposing). What bank controls the output of the securities of your company? They have to be sold, and some bank sells them, I presume.

Mr. MARTIN. The firm of Harris, Forbes & Co., and the firm of Coffin & Burr, are the investment bankers' organization through which we operate.

Mr. QUIN. Where are they located?

Mr. MARTIN. One firm is located in New York and one is located in Boston. They have represented our company for many years in the sale of our securities, and represent our company to-day in the sale of our securities.

Mr. GARRETT. I did not quite get the identification of that memorandum of four and a half pages which you referred to. Who made that memorandum?

Mr. MARTIN. You mean the one of the 3d of December?

Mr. GARRETT. The one you referred to, including the paragraphs which you read.

Mr. MARTIN. That was written by Col. Joyes.

Mr. GARRETT. It did not bear his signature.

Mr. MARTIN. No; it has his initials.

Mr. GARRETT. How did that get to your company?

Mr. MARTIN. He handed it to us.

Mr. GARRETT. He handed it to you?

Mr. MARTIN. Yes.

Mr. GARRETT. It was delivered to you by Col. Joyes?

Mr. MARTIN. Yes.

Mr. GARRETT. Mr. Martin, what do you say to this proposition: I understand now that your agreement was reached by correspondence, before the work began, virtually?

Mr. MARTIN. Yes; I have read it to you here.

Mr. GARRETT. Then what do you say to this proposition, as a lawyer: Where the minds of the parties reach an understanding as to what shall be done in the future, what law governs that contract; the law in force at the time of the agreement of the parties or the law in force at the time of the execution of the contract at some later date?

Mr. MARTIN. I will answer you by saying that these orders that were issued to us, Mr. Garrett, each of them said this, "All these conditions to be embodied in a future contract," and also "suitable arrangements to be made as already tentatively agreed upon to cover the cost of actual cost plus," etc. There were conditions in each of these letters agreed upon, and some were not. These conditions to be embodied in a future contract, necessarily when the future contract was made the law then in effect controls the validity of the contract.

Mr. GARRETT. What kind of a contract do you call this; what name would you give it? Would you call it a continuing contract?

Mr. MARTIN. Growing out of these work orders?

Mr. GARRETT. Yes.

Mr. MARTIN. I can not say that I can call it a continuing contract, or designate it with any such characteristic as that. We merely received work orders and were told to proceed, and proceeded.

Mr. GARRETT. What I am trying to get at is the legal question involved. You are the counsel of the Alabama Power Co., and, of course, you know the law.

The presumption is that we all know it, but it is a very violent presumption sometimes.

Mr. MARTIN. Yes; I accept that, too.

Mr. GARRETT. I am trying to get at the legal phase of it. I understand a great deal of this work was done, but there is a question involved here in connection with a certain option that you are claiming as a matter of law under this contract. When did that take effect, at the time you made the contract, or at the time you executed the contract?

Mr. MARTIN. I will answer that this way. An agreement to make an agreement is the substance of these work orders, and we agreed with Col. Joyes and he agreed with us that we would both make a future contract. But an agreement to make an agreement is not a contract, in the technical, legal sense. An agreement to make an agreement is unenforceable, you will admit that.

Mr. GARRETT. But your agreement began on a memorandum and on correspondence.

Mr. MARTIN. We began work under a memorandum.

Mr. GARRETT. The question I want to know is: When did your rights begin, when you began to execute and perform under the contract by oral agreement and memoranda agreement, or did it begin several months later when it was formally executed?

Mr. MARTIN. When there was a formal execution of the contract, that was the fixing of the rights of the parties. That is my answer to your question.

Mr. GARRETT. There were no rights fixed prior to that time?

Mr. MARTIN. No.

Mr. GARRETT. There is one more question I want to ask you in reference to Dam No. 2, under section 124 of the National Defense Act. I notice that the President, on February 23, 1918, wrote a letter to the Secretary of War. Is that in the hearing?

Mr. MARTIN. I do not think we put it in the hearing, but the Secretary of War did.

Mr. GARRETT. The President said in that letter "I refer to Section 124 of the National Defense Act of June 3, 1916, authorizing the President to determine the best means and adopt the most advantageous projects for the production of nitrates, and appropriating the sum of \$20,000,000 for that purpose. Of this appropriation. I am advised that there is an available unallotted balance of \$13,785,000.

"The completion of dam and power house No. 2, at the Muscle Shoals on the Tennessee River, as designed and projected by your department, is, in my judgment, of vital importance in accomplishing the purpose of the law. I should be pleased, therefore, to have you allot to that work all of the aforesaid balance, after deducting the sum of \$400,000, which I understand will be acquired for the purchase of land required in connection with another project."

What has that to do with your contract?

Mr. MARTIN. It has not anything to do with it.

Mr. GARRETT. I notice in Mr. Graham's report of his investigation in connection with the statement of Col. Joyes, on page 5, it says: "Under a project No. 12F in regard to land for the United States nitrate plant No. 2 at Muscle Shoals there was charged to the appropriations for this fund \$350,000." That was under the national defense act, section 124?

Mr. MARTIN. I am not familiar with that. I am only familiar with what has been stated to the committee by Gen. Williams and Maj. Burns. The Secretary of War stated that none of that appropriation was used for nitrate plant No. 2.

Mr. MILLER. Mr. Martin, the capital stock of the Alabama Power Co. is how much?

Mr. MARTIN. It is something over \$18,000,000 and about \$2,000,000 of preferred stock; that is, outstanding, I mean.

Mr. MILLER. Your company is incorporated under the laws of the State of Alabama?

Mr. MARTIN. Yes.

Mr. MILLER. What do your articles of incorporation specify as to your capital stock?

Mr. MARTIN. Authorized?

Mr. MILLER. Yes.

Mr. MARTIN. \$50,000,000.

Mr. MILLER. And out of that there has been issued about \$18,000,000 in common stock?

Mr. MARTIN. Approximately \$18,750,000 of common stock.

Mr. MILLER. How much preferred stock?

Mr. MARTIN. I think there are about 20,000 shares outstanding, about \$2,000,000.

Mr. MILLER. Is the status of your preferred stock as distinguished from the status of your common stock controlled by any law of the State of Alabama or controlled by the by-laws of your company?

Mr. MARTIN. I suppose by both, by our charter and by the laws of Alabama.

Mr. MILLER. Is there any definition of the status of the preferred stock in the laws of the State of Alabama?

Mr. MARTIN. Yes; preferred stock has such status as the articles of incorporation of a company give to it.

Mr. MILLER. What do the articles of incorporation of your company give to the preferred stock?

Mr. MARTIN. It is a charge on the earnings of the company, of course; the net earnings of the company—those earnings as they are determined after paying the operating expenses and fixed charges.

Mr. MILLER. Is it voting stock?

Mr. MARTIN. Yes; it is voting stock.

Mr. MILLER. In the annual meetings of the directors?

Mr. MARTIN. Yes; it votes *pari passu* with the common stock.

Mr. MILLER. Did I understand you correctly when you said the entire common stock of the Alabama Power Co. is controlled by the Alabama Traction, Light & Power Co. (Ltd.)?

Mr. MARTIN. It is owned by that company and the common stock of that company, in equivalent amount, is held by the public.

Mr. MILLER. Then, so far as the policy of the Alabama Power Co. is concerned, it is controlled by the Alabama Traction, Light & Power Co. (Ltd.)?

Mr. MARTIN. By the stockholders of that company.

Mr. MILLER. And the majority of stockholders of that company are foreign stockholders?

Mr. MARTIN. There is more than 50 per cent of them, as I recollect, who live outside of the United States, but I might add that the only dividends of any sort or kind that have been paid on our securities have gone to American security holders.

Mr. MILLER. I am talking about the stock.

Mr. MARTIN. Our preferred stock is entirely held in this country.

Mr. MILLER. Mr. Martin, is any of the stock of the Alabama Power Co., outside of the 20,000 shares of preferred stock, held by individuals?

Mr. MARTIN. No. The stock of Alabama Traction Light & Power Co. (Ltd.), is held by individuals.

Mr. MILLER. Then there must be a pooling contract?

Mr. MARTIN. There are a great many individuals.

Mr. MILLER. Then there is a pooling contract, is there not?

Mr. MARTIN. There is one pooling arrangement, yes.

Mr. MILLER. There is a pooling arrangement by which all of these individuals—

Mr. MARTIN (Interposing). Not all of them, just among a certain group of individuals.

Mr. MILLER. Just the minority of the holders of the common stock?

Mr. MARTIN. Yes; it represents a minority.

(Thereupon the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

The CHAIRMAN. Mr. Almon, I believe you desire to make a brief statement.

STATEMENT OF HON. EDWARD B. ALMON, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ALABAMA.

Mr. ALMON. Mr. Chairman, I want to make a very brief statement to correct what I think is an erroneous conclusion drawn by Mr. Martin when he stated that he did not understand that nitrate plant No. 2 and the Gorgas plant were authorized and constructed by virtue of section 124 of the national defense act. The national defense act, section 124, authorized the President to con-

struct one or more air nitrogen plants to be operated either with steam or hydroelectric power, one or both, for manufacture of munitions in time of war and fertilizer in time of peace.

I have been somewhat familiar with this subject and have given it some attention by virtue of the Muscle Shoals being in my district, but do not claim to have any better knowledge of it than others. The national defense act authorized the building of these plants. Plant No. 1, plant No. 2, and plants Nos. 3 and 4 which were stopped before they were completed in the State of Ohio, were, all four, in my opinion, authorized by the national defense act. The Wilson Dam is authorized by the national defense act. It was so understood by the President, it would seem, when he issued an order on the 23d day of February, 1918, which is very short, and I will read it:

"MY DEAR MR. SECRETARY: I refer to section 124 of the national defense act of June 3, 1916, authorizing the President to determine the best means and adopt the most advantageous projects for the production of nitrates and appropriating the sum of \$20,000,000 for that purpose. Of this appropriation I am advised that there is an available, unallotted balance of \$13,785,000. The completion of dam and power house No. 2—and that, of course, is a part of nitrate plant No. 2—at the Muscle Shoals, on the Tennessee River, as designed and projected by your department is, in my judgment, of vital importance in accomplishing the purpose of the law."

The CHAIRMAN. That letter was read in the hearings this morning.

Mr. ALMON. Now, I want to make one further statement, that the records, if not in evidence, can be put in evidence, to show that \$350,000 of the \$20,000,000 was expended on nitrate plant No. 2.

Mr. WRIGHT. \$350,000,000.

Mr. ALMON. No; there was only \$20,000,000 appropriated; \$350,000, as the undisputed records show, was used out of that \$20,000,000 in the construction of nitrate plant No. 2, all of which I think shows conclusively that Mr. Martin was in error when he formed the conclusion that nitrate plant No. 2 and the Gorgas plant were not constructed by virtue of the national defense act.

I would like also to call attention to this fact. I remember last February when we had up the question of an appropriation of \$10,000,000 to complete the work on the dam, the question was first a mooted question as to whether it was subject to a point of order. After thorough investigation, Mr. Graham, who was very familiar with the subject, announced in the open House of Congress that the national defense act, section 124, authorized this \$10,000,000 additional appropriation to complete the dam.

I just wanted to make those statements which, I think, on careful study by the committee, will cause them to come to the conclusion that nitrate plant No. 2 and everything connected with it, such as the Gorgas plant, the Steam plant, and the Wilson Dam, are all a part of the nitrates program provided for in the national defense act.

The CHAIRMAN. Mr. Dent, the committee will be pleased to hear you.

STATEMENT OF HON. S. HUBERT DENT, JR., ATTORNEY FOR THE ALABAMA POWER CO.

Mr. DENT. Mr. Chairman and gentlemen of the committee, I confess when I first appeared before this committee in the attitude of an attorney I felt a little queer in view of my long association around the table with the members of this committee. However, I am very glad, very much pleased, indeed, to renew my acquaintance with the members of this committee, with whom I have served so long and so cordially.

I wish to state, Mr. Chairman, at the outset that I appear before the committee simply and solely for the purpose of presenting the legal rights of my clients in the property involved in the Ford proposition. I am not concerned with any policy that the committee may see fit to adopt relative to the disposition of Muscle Shoals. That is a matter entirely for the good judgment of this committee, and, knowing the membership of this committee as I do, I am sure that this committee will give due and careful consideration to every proposition that is made, looking to the good of the Government and of the country in its final disposition of this matter.

So far as Muscle Shoals itself is concerned, many members of this committee know that during my service in Congress I was quite active in trying to have Muscle Shoals developed in some way. It was started when I was a Member, and the chairman was also a member, of the conference committee when the

national defense act was passed in 1916. I fought for that proposition up to the time that my term of office expired as a member of Congress on the 4th day of last March.

The Ford proposition is a new proposition in connection with Muscle Shoals. It is a proposition that has arisen since I retired from Congress. It was never made during my term of office as a Member of Congress, and so far as the Gorgas plant is concerned, and that is the property in which I am interested as an attorney, I do not know that I ever heard of the Gorgas plant pending the various propositions that were made to develop Muscle Shoals during my term of service as a Member of Congress, and while we were trying to develop Muscle Shoals I do not recall that the Gorgas plant ever entered into any of our deliberations or was ever considered as a necessary adjunct to the development of the Muscle Shoals proposition. As a matter of fact I may have heard of the Gorgas plant, but it had no significance to me. I knew not where it was or how it was constructed, and when we were endeavoring in the last Congress to get the Government to continue its operations at Muscle Shoals I am sure that the Gorgas plant was never considered as necessary in order for the Government to develop that project. So that the Gorgas plant has been put into the Muscle Shoals project by Mr. Ford, and since the 4th day of last March.

Now, let it be remembered that the Gorgas plant is 88 miles south of Muscle Shoals; that it is situated out in the coal fields of Walker County; that the original plant was constructed by the Alabama Power Co. as a reserve plant in order to effectuate their hydroelectric system in the State of Alabama, to utilize it in case of low water.

According to the proof the Government itself came to the power company with the idea of utilizing this plant pending the construction of its Muscle Shoals project, after the Government had decided to undertake the manufacture of nitrates at that point.

Now, Mr. Chairman, the examination in this case has taken a wide range. A great many, it seems to me, immaterial questions have been asked of the president of this company in his testimony before the committee, undertaking to present his legal rights; and let it be remembered right here, too, that this is the first time that the company has had an opportunity to be heard at all. Notwithstanding the fact that everybody concedes that it owned the original plant at Gorgas; notwithstanding the fact that everybody concedes that it owns the land upon which the plant is located; notwithstanding the fact that everybody concedes that it owns the right of way over which the transmission line up to Sheffield runs, yet it never was consulted either by Mr. Ford or by the War Department as to its rights in the matter at all, and this is the first opportunity it has had to present those rights to anybody.

I take it for granted, Mr. Chairman, that it is an immaterial matter, whether it be true or not, that the people of Alabama are hostile to the Alabama Power Co. I take it to be immaterial whether a majority of the stock of the Alabama Power Co. is owned by people in England and other foreign countries or not. I take all of these things to be absolutely immaterial, if the Alabama Power Co., a corporation duly chartered under the laws of Alabama, has a valid contract with the Government of the United States.

Now, of course, everybody knows that there is some prejudice, some hostility against every public-service corporation in this country. It is sometimes a little difficult to understand, because I do not see how we can get along without them, myself; but still that hostility exists against every kind and character of public-service corporations; but I do know this, that the Alabama Power Co. is chartered under the laws of Alabama; that it is subject to the jurisdiction and control of the Public Service Commission of Alabama, and that commission has about as wide powers as any I know of in any State in the Union; and I know, furthermore, that Alabama is one of the richest States in the United States in water power, and during all of its existence as a State that water power had been going to waste until the Alabama Power Co. came to our assistance.

But that is neither here nor there. The fact is, the Alabama Power Co. has a contract with the Government of the United States, conceding now first the validity of the contract. It has a contract with the Government of the United States by which the Government of the United States was to furnish the money to increase the equipment at the Gorgas plant and at the end of a certain period, or at a particular time, we may say, the Government has the right to demand of the Alabama Power Co. that it purchase the property which was

placed upon its land and in connection with its original plant, and the Alabama Power Co., on the other hand, has the right to demand of the Government that it sell to it that power equipment.

Now, what are the objections to that contract? First, it is said that the contract was dated on December 1, 1917. Second, it is said that the contract is violative of the spirit and intention of section 124 of the national defense act. And third, it is said that it is a hard and unconscionable bargain.

Now, let us take those three objections up in the inverse order. First, that it is a hard and unconscionable bargain.

In the first place, let me call the attention of the lawyers on this committee to the fact that if this contract is unconscionable, if it is a hard bargain, it appears on the face of the instrument itself. It has not been developed by any outside, extraneous testimony. I repeat, it appears on the face of the instrument itself. Now, I know of no rule, even in a court of equity, which will relieve against a contract because one party gets an unfair advantage over the other if that advantage appears on the face of the contract itself and the contract was executed by parties competent to contract. If both parties had the mentality to make the contract, could read and understand the contract, no court on God's green earth would relieve against its terms because on the face of it it appears that one party got a little advantage of the other. One of the parties must be under a disability or there must have been some outside perpetrated fraud or advantage taken before a court of equity, even, would intervene to relieve against a contract of that kind; but let us see if the contract is unconscionable.

The main reason, as I gather it, from the various questions asked by the members of this committee, that it is a hard bargain and an unconscionable contract, is because the only party that can purchase the Government's interest in the contract is the Alabama Power Co. Now, is that unusual? I again ask the lawyers on this committee if the law books are not full of cases where the owner of land has entered into a contract with a third party to put improvements on his land and to use those improvements for a stipulated period of time, and at the end of that time the owner to pay for them at such a price as may be agreed upon between them, or if not at such price as may be fixed by arbitration. I do not know of anything that could be fairer than that. How else could you have made the contract.

The Government might have gone down there and put up a plant of its own, but I dare say it would have cost more than it will cost the Government under this plan, and let me remind this committee that the Government did go to Nashville and put up a powder plant, and the Government went over here to Nitro, Va., and put up plants, spending millions of dollars upon those two plants with the result that when the Government did it itself, both of them were sold for scrap and the Government only got a few thousand dollars out of it, whereas under this contract the Government has the right to obtain the fair value for the property that is put upon the land of the Alabama Power Co., and if the parties themselves can not agree upon the terms, then arbitrators fix the value, and arbitrators, Mr. Chairman, are not bound by the strict rules of law in fixing the price of property.

I dare say they would take into consideration the original amount that the Government put into the plant; I dare say they would consider how much it would cost to reproduce it at this time, if they were entering into the arbitration now; and I dare say they would consider the earning capacity of the plant as it is, and, of course, take into consideration the wear and tear and the use of the property for the time that it has been used. All of those things being taken into consideration, the arbitrators could reach a fair conclusion as to what the Alabama Power Co. would have to pay for this property, and under the contract they would have to pay that price, and I venture the assertion that this is one of the fairest contracts that was made during the war, in the stress of war, of that class.

Now, it was not unusual for the Government to make contracts of this kind: in fact, the Government made contracts of this kind all over this country from the beginning of the war almost up to the end, and if you will search the records of the various departments of the Government, you will find that this character of contract was made by the different branches of the Government in various parts of the United States during the war, and the only difference that I have found is that in most of the contracts, the Government, if the contractor did not pay the price that the Government thought its property was worth, could remove the property from the premises at its own expense, whereas under this contract the Government can either remove it if it wants

to or it can make the Alabama Power Co. pay what arbitrators say is the fair value of the property.

Now, just let me call attention right in that connection to the hearings before the Naval Affairs Committee of the United States Senate, Sixty-fifth Congress, third session, pursuant to Senate resolution 404, the resolution directing the Committee on Naval Affairs to investigate the so-called motor boats and the contracts therefor made with the Ford Motor Co. for the construction of said boats.

Admiral Taylor testified before the committee. I just want to read a few extracts to show that they made this sort of contract with Mr. Ford and they made them with various other people during the war, and put money on property belonging to somebody else, with the understanding they could move it off or get paid for it. That is all there is to it. Senator Walsh said:

"In one of Senator Poindexter's questions he referred to the fact that you had spent \$3,500,000 on property which belonged to the Ford Co. I understood you to say you had spent \$35,000,000 on property owned by others on improvements on that (their) property."

The CHAIRMAN. What page is that?

Mr. DENT. Page 50.

"Admiral TAYLOR. On one enterprise, in connection with the 150 destroyers, and a part of that is on property which we own. A part of it is upon property belonging to the city of Providence and the rest upon property of various shipyards. Those contracts were made before this contract, and this contract follows substantially the form of the other contracts.

"Senator WALSH. Can you designate some of the companies with which you made such arrangements?

"Admiral TAYLOR. Yes. The Bethlehem Co., both for the Fore River Shipyard and the Union Iron Works; the New York Shipbuilding Co., Cramps, and Newport News. If I am not mistaken, that advance for the increased plant at the yard of the New York Shipbuilding Co. was \$3,500,000, in connection with the destroyers.

"Senator POINDEXTER. On land that the Government did not own?

"Admiral TAYLOR. On land that the Government did not own. That was fully understood and explained at the time we got the authorization; it was fully explained to the Committee on Appropriations of the House and they were told what we expected to do, and they gave us the money and they gave us the strongest powers that have ever been put into a bill.

"Senator PITTMAN. You say there was \$3,500,000 advanced to the New York Shipbuilding Co. We built a plant which cost that amount?

"Admiral TAYLOR. We have advanced them working capital to the amount of about \$5,000,000.

"Senator PITTMAN. You gave to the Fore River Co. \$25,000,000."

Again, my attention is called to page 38 of the same hearings.

The CHAIRMAN. Have you identified the hearing for the record?

Mr. DENT. Yes, sir. On page 38, Senator Lodge, quizzing Admiral Taylor:

"Senator LODGE. That leads me to ask another question. What becomes of the plant which the Government built on the River Rouge?

"Admiral TAYLOR. The contract provides for the handling of that plant the same as the other plants which we have provided. That contract is substantially the same in that regard as the contract made for the destroyers, with the exception that it is slightly more favorable. The contract provides that at the end of the contract there shall be an appraisal made of that plant by the compensation board, which handles the financial matters, and if the contractor is satisfied with our appraisal he may pay the price for the plant. If he does not accept, we will have the right to remove the portable plant. In the case of the other plant, we have the right to wreck the buildings for their scrap value. Those are the standard provisions in these contracts."

Now, I think, Mr. Chairman, that the Alabama Power Co., when that was the habit of the Government, not only in the War Department but in the Navy Department and in the other branches of the Government, should not be singled out as having made an unconscionable bargain with the Government, especially when their contract was a little different from the others and provides for a repayment to the Government of the property that they invest in their plant at fair value, to be fixed by three arbitrators, one selected by the Government, the other by the power company, and the two selecting a third.

Now, the other objections to the contract are the date and the fact it is contrary to section 124 of the national defense act.

I take it, it will not be disputed by any lawyer on the committee that one of the well-established exceptions to the rule that parole evidence can not be introduced to vary a written instrument is that you can always prove the true date of the instrument. That rule is laid down in all the lawbooks without any single, solitary exception, and the undisputed proof in this case shows that this contract was not actually executed until November, 1918, some months after the passage of the act of July 9, 1918, authorizing the heads of the various departments to sell property of the Government that was acquired during the war, just as this was.

Now, before I go any further into that, the question has been raised as to whether or not the Alabama Power Co. had anything to do with the passage of that law. I would like to make a brief statement in regard to that, because that question has been raised by some questions by different members of the committee.

That provision of law is a rider on the Army appropriation bill of July 9, 1918. It is very comprehensive. I have before me that Army appropriation act on page 497 of this volume, which the committee has, of "Legislation of the war Congress relative to the Army," which was compiled shortly after the war and given to each member of our committee at the time. Of course, the act can be found elsewhere. On page 6 of the act, page 502 of this volume, there is a provision headed, "Sale of war supplies."

The CHAIRMAN. Was that provision put in by the Senate?

Mr. DENT. No, sir; I do not think that was put in by the Senate. I was going to explain that to you, and I think you will recall, Mr. Chairman, when I make the explanation, how this all occurred. I thought I would read it to the committee, as it is very brief, to show how comprehensive it is.

The CHAIRMAN. Proceed.

Mr. DENT. "That the President be, and he hereby is, authorized, through the head of any executive department, to sell, upon such terms as the head of such department shall deem expedient, to any person, partnership, association, corporation, or any other department of the Government, or to any foreign State or Government engaged in war against any Government with which the United States is at war, any war supplies, material, and equipment, and any by-product thereof, and any building, plant, or factory acquired since April 6, 1917, including the lands upon which the plant or factory may be situated, for the production of such war supplies, materials, and equipment which, during the present emergency, may have or may hereafter be purchased, acquired, or manufactured by the United States. * * *"

Now, I want to refresh the memory of several members of the committee and particularly the chairman. I think you, Mr. Chairman, will recall it by reason of the fact that you and I served on the conference committee that finally worked out this bill.

The CHAIRMAN. It went to conference?

Mr. DENT. Yes, sir.

The CHAIRMAN. Then it must have been put in in conference, or the Senate may have offered it as an amendment.

Mr. DENT. It occurred in this way, as I recall it, Mr. Chairman: The Secretary of War sent to me at that particular time, and for some months beforehand, a large batch of bills that were called War Department measures, that the War Department wanted to get through Congress, and this bill was among the number. The Military Affairs Committee met and favorably reported practically all of these War Department measures, measures that the Secretary of War had sent down to me as chairman to present to the committee and had asked for their passage. Practically all of these bills were favorably reported and put on the calendar, but the calendar was so crowded we could not get any day to consider these particular bills, so we decided to tack them on to the Army appropriation bill and run the gantlet of a point of order. I am not sure whether there was a point of order made against this on the floor of the House or not; I think not. My recollection is that this was incorporated in the House appropriation bill itself and went through, but if not I am sure that it was put on in the Senate at the request of the Secretary of War and as a part of the legislative program that he needed during the war to carry out war purposes and contracts that had already been made. I would like to send this act up to you to look at. You will find that this appropriation bill of July 9, 1918, is loaded down with legislative riders, all due to the fact that

we were trying to put through the legislation that the War Department considered as absolutely essential in order to carry on its program. Beginning on page 36 of the bill and page 532 of this volume, on down to the end of the bill, page 58 of the bill, and page 554 of this volume, are the riders. There are 22 pages of riders attached to the appropriation bill, and this is one of them. I simply show you that, Mr. Chairman, in order to explain how that got into the Army appropriation bill. It was a request of the Secretary of War and was one of his schemes of legislation.

Now, Mr. Chairman, coming down to the proposition as to whether or not this contract is violative of section 124 of the national defense act, in the first place there may arise some question, if the contract between the Government and the Alabama Power Co. violates the spirit, the purpose, and the intent of section 124, whether or not the Government itself can claim any right in the premises, and whether or not both parties are not in pari delicto, and the law would leave them where they stood. Judge Parker, of New Jersey, who is a member of the committee, directed attention to that point, when Col. Hull was on the stand testifying as to this contract. However, I simply mention that because it is not the disposition of our people to take any such technical advantage. We are standing on what we believe to be substantial rights, but our contention is that this section absolutely has no application to this contract for two reasons: First, because this section limited the appropriation to \$20,000,000, and under the order that Judge Almon read here to-day, which is the same that Mr. Martin read to the committee on Friday, it was provided that the unexpended balance of that money should be used for the construction of the dam, so that there was nothing left by way of appropriations to carry on any other feature of section 124.

Now, section 124 gives the President several powers.

In the first place, the President is authorized and empowered to make or cause to be made an investigation as to the cheapest, best, and most available means for the production of nitrate and other munitions of war; second, he is also authorized and empowered to designate for the exclusive use of the United States, if in his judgment such means is best and cheapest, such site or sites upon any navigable or nonnavigable river or rivers or upon the public lands, as in his opinion will be necessary for carrying out the purposes of this act; and, third, he is authorized to construct, maintain, and operate, at or on any site or sites so designated, dams, locks, improvements to navigation, power houses, and other plants, etc.

So that the President under this order simply selected and designated the site and expended every dollar of unexpended balance of that \$20,000,000 in the selection and improvement of the site. There was no money left with which to build any nitrate plants under that section of the law, and we have got to look somewhere else for that purpose.

I remember distinctly, as I recall it, asking Secretary Baker on one occasion myself where they got authority to spend the \$85,000,000 that was spent down there at Muscle Shoals, and he answered that it was under the ordinance and fortification act passed during the war that this money was expended; but another and a conclusive reason why this contract is not governed by section 124 or that portion of it which reads that "the plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital," is that this contract is not either for the construction or operation jointly by the Alabama Power Co. and the Government of the nitrate plant. The contract, at most, between the Government of the United States and the Alabama Power Co., in so far as it relates to Muscle Shoals, is nothing more nor less than the purchase of energy by the Government of the United States from the Alabama Power Co. for the purpose of supplying them with light and power while they are constructing the work there at Muscle Shoals.

Why, confessedly, the Alabama Power Co. has never had a word to say or a thing on earth to do with the construction of those plants at Muscle Shoals, and the mere purchase of energy under this contract, the mere purchase of the right to acquire power from a plant 88 miles away so that they might have light and power while they were constructing the plant can not in any form be said to be a joint contract for the construction of the nitrate plant. It is straining language, Mr. Chairman, to contend otherwise.

In addition to that, the officers of the Ordnance Department who entered into this contract for and on behalf of the Government testify distinctly that such is not the case; that section 124 was not looked to for the purpose of making

this contract at all. For instance, during Maj. Gen. Williams's testimony before this committee, part 2, page 78, Mr. Miller read to Gen. Williams that portion of the act of June 3, 1916, which authorizes the President to erect nitrate plants, and Gen. Williams, in answer to the question propounded by Judge Miller, after reading that portion of the section, said:

"Gen. WILLIAMS. Not a cent of money carried in that act was used in this enterprise. It was paid for out of the appropriation for armament and fortifications."

Then Mr. Miller said:

"Mr. MILLER. Then it was not provided for under this act?"

"Gen. WILLIAMS. No."

Now, that is the construction, Mr. Chairman and gentlemen of the committee, placed upon the contract by the officers of the War Department themselves who were representing the Government in this transaction.

At this point let me call attention to the fact that we are dealing with a peculiar proposition by which it is attempted to make a contract on the part of one party with another for the disposition of the property rights of a third party. All we are asking is that the property rights of the third party should be given fair and just and due consideration. We claim that in order for the Government to carry out that portion of the contract, if the Government should enter into a contract with Mr. Ford in accordance with his proposition, the Government must condemn our contractual rights with it, as well as the land and the plant which confessedly we own in fee simple. In order to do that the Government must surrender about \$5,000,000 that it has put into that plant, and in addition to that the Government would be required to pay us whatever the courts would say our property rights were in the premises down there, amounting at least to some three or four million dollars. In other words, if the Gorgas plant is to be left in Mr. Ford's proposition, the Government is giving to Mr. Ford nine or ten million dollars, free gratis, for absolutely nothing, consisting of the \$5,000,000 that they have already expended and the something like \$4,000,000 that we have put into this property.

The Government is to get only \$5,000,000 from Mr. Ford for the two big plants at Muscle Shoals, so that in the end the Government will not only not get a nickel for its plants at Muscle Shoals but will actually have to go down in its pockets in order to carry out this agreement in accordance with Mr. Ford's proposition, and why? Is it necessary to the Muscle Shoals project? Is it any part of it? Is it not 88 miles away from there? Was it ever considered as a part of the Muscle Shoals project when we undertook to get the Government to continue its operations? Nobody ever heard of it before, and I say talk about unconscionable bargains, talk about hard bargains, gentlemen of the committee, here is a man that proposes to make the Government go down in its pockets and not only give up the \$5,000,000 that it has already expended upon this plant but to go down in its pockets and condemn the private property of another corporation at an expense of at least three or four million dollars in order to enable Mr. Ford to carry out his Muscle Shoals project, when it is 88 miles away from there.

That is not all, Mr. Chairman. It is not so perfectly clear—I am not so cocksure, as my good friend, Brother Quinn, is—that the Government has any right to condemn our plant, which is used in connection with another purpose, and which is situated 88 miles away from there. The right to condemn is a powerful right. It is a very extensive right on the part of the Government of the United States, but that right to condemn is limited to property that is necessary and essential in order to carry out the fundamental Government purpose; and if it can be shown that this plant is not necessary in order to effectuate the public purpose of developing Muscle Shoals so that we can make nitrogen from the air, then I question whether any court in this land will take our property away from us and give it to Mr. Ford under a condemnation proceeding. At any rate, if you make this contract, nobody could blame the Alabama Power Co., as the owner of this property, from asserting its rights in the courts, and acceptance of the contract in its present form would mean a lawsuit.

Now, Mr. Chairman, I do not intend to weary the committee any more than I can possibly help, but I want to discuss just one other feature of this proposition, and then I am going to quit.

The CHAIRMAN. I want to say, Mr. Dent, that you are not wearying the committee, but the committee is deeply interested in what you are saying.

Mr. DENT. Thank you very much, Mr. Chairman.

Suppose there was a technical advantage, a purely legal technical advantage, that the Government has, and which it could use, in order to take advantage of the Alabama Power Co. and refuse to carry out the terms of the contract. Let us come right down to that point. I do not think so, because I think we have established clearly a legal right in the premises here which I think any court of the land will uphold, but let us go further and let us suppose, just for a moment, that the Government could, by some technical, legal question, take advantage of the Alabama Power Co. and refuse to carry out this contract.

Secretary Weeks stated very frankly before the committee that he was surprised at the opinion of the Judge Advocate General stating that this contract was void; but even if it were void, he did not believe that a great Government like this ought to take advantage of a technicality and refuse to carry out its obligations, and thereby set such an example to the entire American people.

The Congress of the United States, so far as I know, representing the American people, has never been guilty of anything of that kind. On the contrary, the Congress of the United States has always exhibited just the opposite spirit. That was well illustrated by the passage of what somebody has seen fit to denominate as the Dent Act of March 2, 1919. I do not know who named it the Dent Act, because we all worried over that act together for a long time, and we had a great deal of trouble with it. You will remember the comptroller brought us down a bill which we did not like, and we all set to work and wrote one ourselves, and finally worked it out among ourselves, but at any rate that act, according to the testimony before us, as I recall, at that time was said to have involved at least something like \$1,600,000,000 worth of contracts—contracts that had been entered into over the telephone, contracts that had been entered into by telegram, contracts that had been entered into by mere verbal conversation between the contracting officers and the contractors. Under the ruling of the comptroller, it was held that not a single, solitary one of those contracts could be enforced, because the statute required that all Government contracts should be signed by the contracting officer and attached to the contract should be an affidavit to the effect, as I recall the substance of it, that the contract was to the advantage of the Government and that he, the officer, had no personal interest whatever in it. The comptroller ruled that unless all three of those conditions were complied with—that the contract was in writing, that it was signed by the contracting officer, and this affidavit attached by the contracting officer—that the contract was not enforceable.

What did Congress do in that situation? We passed the so-called Dent Act correcting, or rather validating, so to speak, every bona fide contract that was entered into on the part of the Government, on the one hand, and the contractor, on the other, regardless of its form, regardless of whether it was signed by the contracting officer or not, regardless of whether the affidavit was made or not; and there was not a dissenting voice, as I recall it, on the floor of the House against the passage of this legislation. We did have some controversy over the form that it should take. Some of the Members wanted a commission to pass on the contracts, whereas the bill itself authorized it to be done under the direction of the Secretary of War, as reported by the committee, and it finally passed in the form the committee reported it. But there was not a dissenting voice, as I recall it, on the floor of the House or of the Senate against the passage of this legislation. Why? Because this Government was too big to take advantage of any technicality; and if the contract had been entered into in good faith and it had been performed on the part of the contracting party, then Congress held that that contract should be fulfilled.

Now, I want to call attention briefly in that connection to the language of this statute. As I construe this statute, it is permanent law. It is the law of today. The time provision in it is a proviso to the effect that this act shall not authorize payment to be made of any claim not presented before June 30, 1919; but that only applies to cases where the other party to the contract has a money demand against the Government. The Alabama Power Co. has no money demand against the Government in this case, but is simply asking that its contract be fulfilled. If there is any money demand at all, it is due from us to the Government.

Now, that statute reads as follows:

"That the Secretary of War be, and he hereby is, authorized to adjust, pay, or discharge any agreement, express or implied, upon a fair and equitable basis that has been entered into, in good faith, during the present emergency

and prior to November 12, 1918, by any officer or agent acting under his authority, direction, or instruction, or that of the President, with any person, firm, or corporation for the acquisition of lands or the use thereof, or for damages resulting from notice by the Government of its intention to acquire or use said lands or for the production, manufacture, sale, acquisition, or control of equipment, materials, or supplies, or for services, or facilities, or other purposes connected with the prosecution of the war, when such agreement has been performed in whole or in part, or expenditures have been made or obligations incurred upon the faith of the same by any such person, firm, or corporation prior to November 12, 1918, and such agreement has not been executed in the manner prescribed by law."

Now, I say that that statute recently passed by Congress is an expression of the congressional will that the Government of the United States, even if it had the opportunity to take advantage of the Alabama Power Co. in this case, because of the fact that perhaps the contract may be in violation of section 124 of the national defense act, that under no circumstances ought the Government, in this instance, to set such an example to the American people.

Mr. Chairman, in simple form, that presents our case. Your attention has been called to the fact that we also own the abutting property at dam site No. 3 on the Tennessee River, which is involved in Mr. Ford's proposition. Of course, we concede that if the Ford proposition should be accepted by the Government, unquestionably, Congress could authorize that property to be condemned, because that is directly in connection with the navigation of the Tennessee River. There is no question about that, but the other proposition we do not by any means concede.

Our contention therefore is that this contract is really fairer than most of the contracts that were made during this time; that it is in line with the policy adopted by the Government during the war in making such contracts; that it is in accordance with the general law on the subject, that the owner of land has a right to make a contract with a third party to put improvements on it, he, the owner, to purchase the improvements at the end of a certain period, either by agreement or by arbitration; that the date of the contract shows that it was executed after Congress had authorized such a contract to be executed, and I may say in this connection that the right to make a sale of property unquestionably carries with it an incidental right to make a contract for the sale of the property; and that it is not in violation of section 124 because the presidential order and the testimony of the Ordnance Department all shows that this contract was made, under the authorizations for armament of fortifications; and, furthermore, that it is not a joint undertaking on the part of the Alabama Power Co. and nobody can contend that it is a joint undertaking to build and construct those nitrate plants and make fertilizer up there at Muscle Shoals on the part of the Alabama Power Co. and the Government simply because the Alabama Power Co. transmits, for a distance of 88 miles, a little power in order to light the grounds; and, lastly, Mr. Chairman, we contend that even if you have the right to take a technical advantage of the Alabama Power Co., the Government of the United States is too big and Congress is too honest to justify any such legislation.

The CHAIRMAN. Mr. Dent, the attention of the committee has been called to two laws that were passed in 1918, one of which you have already explained.

Mr. DENT. Yes.

The CHAIRMAN. Did the first law, which I think was dated in May, 1918, have anything to do with the Alabama Power Co.?

Mr. DENT. Mr. Chairman, I have heard a good deal of reference to that law. I am not familiar with it. I am not basing anything on that, and I confess I am not familiar with it. I am basing our rights upon two acts, and I have called your attention to two riders in that Army appropriation bill. You will find in the appropriation act of July 9, 1918, in addition to that power to sell Government property acquired since the beginning of the war, that there was also a provision authorizing the Ordnance Department, in addition to the powers it now has, to purchase ordnance and ordnance supplies and materials to the extent of not exceeding \$500,000,000, so that they would have been authorized under that clause of the Army appropriation act of July 9, 1918.

I believe there was one other proposition I wanted to bring to your attention, but to me it is so simple that I overlooked it.

The CHAIRMAN. Our attention has been called to the act of May 10.

Mr. DENT. Mr. Oliver has just handed that to me. I will read it if the Chairman wishes. On May 10, 1918, an act was approved providing, as follows:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That during the existing emergency the President be, and he hereby is, authorized in his discretion and upon such terms as he shall deem expedient, through the head of any executive department, to sell any supplies, materials, equipment, or other property heretofore or hereafter purchased, acquired, or manufactured by the United States in connection with or incidental to the prosecution of the war, to any person, partnership, association, or corporation or to any foreign State or Government engaged in war against any Government with which the United States is at war, and any moneys received by the United States as the proceeds of such sale shall be covered into the Treasury."

That is not quite as comprehensive as the act of July 9, 1918, but is along the same lines. Do you know why that act was passed, Mr. Oliver?

MR. OLIVER. I do not. It was put in by Mr. Martin.

The CHAIRMAN. Do you contend that under the provisions of that law the Alabama Power Co. was affected?

MR. DENT. Yes, sir; I do. I think it is broad enough to cover that, although I think the act of July 9—

The CHAIRMAN. Will you kindly state wherein you think it is broad enough.

MR. DENT. "During the existing emergency, the President is authorized through the head of any executive department to sell any supplies, materials, equipment or other property heretofore or hereafter purchased, acquired, or manufactured by the United States in connection with or incidental to the prosecution of the war."

Any property that has been acquired or that may hereafter be acquired and that was used in connection with the prosecution of the war, I think that is certainly broad enough to cover it. I presume we followed that in the act of July 9, in order to make it a little more comprehensive.

There is one point I believe I did overlook that was suggested by a question propounded by one member of the committee, and that is, If the minds of these parties came together in December, 1917, upon the terms of the contract, whether or not the law then in existence would not govern rather than the law in existence at the time of the actual execution of the written instrument. I need only call the attention of the committee to the well-established rule that where parties enter into negotiations and they are pending for a long time, with verbal negotiations and written memoranda, etc., that all previous negotiations are merged finally into the execution of the written instrument. I do not think there will be any dispute about that proposition.

I believe that is all I have to submit, unless there are some questions.

MR. OLIVER. Mr. Chairman, I would like to make a statement, purely a legal statement.

The CHAIRMAN. After we finish with witness, if you please, Mr. Dent, probably some of the members of the committee would like to ask you some questions.

MR. DENT. I will be very glad to answer them if I can.

MR. MCKENZIE. There is only one question I desire to ask my old colleague, and that is in connection with the so-called Dent Act and the struggle which he has referred to that took place in our committee in an endeavor to rewrite that law as it now stands. I want to ask you if it is not a fact that when the first bill was submitted to the Committee on Military Affairs, it practically gave immunity to all army officers for violation of the then existing law of the land in connection with contracts entered into by representatives of the War Department with civilians?

MR. DENT. That is my distinct recollection.

MR. MCKENZIE. And is it not a fact that the Committee on Military Affairs reasserted in this law and put in a provision reasserting the law and holding those officers responsible, regardless of anything that might have transpired during the war?

MR. DENT. That is very true, and if my recollection serves me right, you are the author of that amendment.

MR. MCKENZIE. I do not know about that.

MR. DENT. Yes, sir; I think you were the author of that amendment.

MR. MCKENZIE. At least I was one of the members of the committee who insisted that the rights of the Government should at least be safeguarded to that extent.

MR. DENT. I think you suggested the amendment. That is my recollection.

MR. MILLER. Mr. Dent, as I remember it, there arose down in your section

a case on this very point—on the right of the Government to condemn—which is a point that you have raised here, as to whether, under the conditions, the United States Government would have the right to condemn.

Mr. DENT. I suggested that point, Mr. Miller.

Mr. MILLER. A case arose down in your State at Montgomery, was it not, that got into the Federal courts?

Mr. DENT. Yes, sir; the Forbes case, you are talking about.

Mr. MILLER. Yes; in 259 Federal.

Mr. DENT. Yes, sir; that grew out of the building of Camp Sheridan, which was an Army camp established by the War Department in Montgomery.

Mr. MILLER. If I remember correctly, the Government was starting in to condemn some property of a man by the name of Forbes.

Mr. DENT. Yes, sir; that is correct.

Mr. MILLER. The Government had made some arrangements by which, after these condemnation proceedings, the property should go to the city of Montgomery, or something of that sort.

Mr. DENT. Yes, sir.

Mr. MILLER. And the Federal court held that the interest of Mr. Forbes in what the Government should subsequently do with that property was no more than the interest of any other citizen of the United States.

Mr. DENT. Yes, sir.

Mr. MILLER. Now, in the absence of any intervening legislation, would not that same principle of law apply to the property of the Alabama Power Co.?

Mr. DENT. I do not think so, Judge Miller. In that case Mr. Forbes owned land that was contiguous or was a part of the property upon which the military authorities had selected a camp for the training of a division of troops, and they could not agree with Mr. Forbes, and the Government filed condemnation proceedings against him to condemn those lands, and incidentally the question arose—I have not read the case recently—incidentally the question arose as to whether or not the Government, as I understand it, having decided to deed this property to the city of Montgomery after the war could offset the proceedings—you see this condemnation proceeding was not finished until after the war was over. It was begun during the war, but the proceedings were not terminated until after the war, and Judge Clayton, who was the judge that presided in that case, a former Member of Congress and a former chairman of the Judiciary Committee of the House, held it was immaterial to Mr. Forbes what the Government was going to do with it after they condemned it, but they had a right to condemn at the time they instituted the proceedings for the purpose of establishing a military camp to train a division of troops, and they actually did establish it.

Mr. MILLER. You claim that the facts under which that condemnation case was carried on in the court are to be distinguished from the one in question here.

Mr. DENT. Absolutely, because here I contend that this reserve steam plant of the Alabama Power Co., situated out in the coal fields of Walker County, 88 miles from there, can not of necessity be essential to the development of the Muscle Shoals project.

Mr. MILLER. That it is not a part and parcel of it.

Mr. DENT. Yes, sir.

Mr. CROWTHER. Mr. Dent, I have twice asked this question of two different witnesses as to whether or not there was any advantage in waiting until a later date in signing this agreement; that is, any advantage in waiting for legislation to occur during the interim. I did that not in a spirit of criticism, but merely for information, because from the information I gleaned from my many legal friends, from whom I must get such information, being just a layman myself, they all differed as to when this agreement was valid, whether on the date of December 1, 1917, or the date when it was signed.

Mr. DENT. Yes.

Mr. CROWTHER. That was why I asked that question; that is all.

Mr. WURZBACH. Mr. Dent, what do you understand by the words, "the head of any executive department." What kind of officers do you understand that to include?

Mr. DENT. The chiefs of bureaus, Mr. Wurzbach. For instance, in this case, Gen. Williams, the Chief of Ordnance.

Mr. WURZBACH. Gen. Williams?

Mr. DENT. Yes, sir.

Mr. WURZBACH. Did Gen. Williams sign this contract?

Mr. DENT. No, sir; but he authorized the man who did sign it to sign it for him. It says, "through the heads of the executive departments."

Mr. WURZBACH. Now, do you not think that the wording of these statutes means that the contract of sale must be entered into by one of the heads of departments, personally, or by a special delegation of power from the head of the department to do that particular act?

Mr. DENT. No. I do not, Mr. Wurzbach. I think when it says through the head of the department, they intentionally use that language because it was a physical impossibility for the head of the department, during the war, to sign all of the war contracts that they made.

Mr. WURZBACH. You think that any Army officer—

Mr. DENT (interposing). Designated by the head of a bureau.

Mr. WURZBACH (continuing). Could, under the terms of these acts, bind the Government without showing any special authority to do the particular acts done by the officer.

Mr. DENT. The special authority is shown by the order of the head of the department, Gen. Williams authorized this particular individual to sign the contracts for and in the name of and on behalf of the Government.

Mr. WURZBACH. What evidence of that authority have you?

Mr. DENT. In writing. It is in the record.

Mr. WURZBACH. I mean authority to sign this contract. The contract was executed and delivered in November.

Mr. DENT. Yes, sir. My attention is called to the fact that the contract itself recites that this particular officer was authorized by Gen. Williams, the head of the Ordnance Department, to sign the contract, for and in the name and on behalf of the Government. If that were not so, I still contend that the Dent Act would protect this contract because of its informal execution.

Mr. WURZBACH. I had reference to the acts of May and July 1918.

Mr. DENT. I understood that. In the body of the contract there is this recital: "This agreement, dated December 1, 1917, between Alabama Power Co (Inc.), a corporation organized and existing under the laws of the State of Alabama (hereinafter called the "contractor"), party of the first part, and the United States of America, by William Williams, lieutenant colonel, Ordnance Department, the United States Army, acting as contracting officer by authority of the Chief of Ordnance of the United States Army."

Mr. WURZBACH. You do not think that recital would be conclusive, do you?

Mr. DENT. No. I do not think it would be conclusive, but Gen. Williams has testified that he authorized the contract and approved it.

Mr. WURZBACH. He did testify to that?

Mr. DENT. I so understand.

Mr. WURZBACH. I do not remember that testimony.

Mr. DENT. The effect of the testimony is that, and I am sure he will testify to that effect, because his testimony says he approved this contract, and he says it ought to be carried out, as does also Maj. Burns of the same department.

Mr. WURZBACH. Your understanding is that it must be authorized by the head of the department.

Mr. DENT. Yes. And if I were trying this case in court I would have Gen. Williams as a witness to prove the authority for it, if I was called upon to make technical proof that I would have to make in a court of justice.

The CHAIRMAN. I think Gen. Williams did state that at least in his opinion the Alabama Power Co. had a moral obligation against the Government, or that the Government had a moral obligation toward the Alabama Power Co.

Mr. DENT. Which is the same thing as approving the contract?

The CHAIRMAN. As I remember it, that is the express language he used.

Mr. WURZBACH. That was his conclusion, but I did not hear him testify that he authorized the execution of this particular contract.

Mr. DENT. He may not have said that in so many words, but if the committee wants to go into that technical proof, I am prepared to prove that. I can state of my own personal knowledge that I can prove it by Gen. Williams, because I have talked with him about this contract myself.

The CHAIRMAN. It is my impression that he stated before the committee that he authorized some of these things to be done.

Mr. WURZBACH. I do not dispute that. The question I was putting was whether or not he authorized the execution of this contract.

The CHAIRMAN. I think that was his testimony.

Mr. DENT. That would be involved if they had not finally put the contract into written form and duly executed it. That applies as between individuals and not as between a party and the Government, on account of the fact that Government contracts must be executed in a certain way or otherwise they are void. I think that is the rule of the Comptroller of the Treasury.

Mr. GARRETT. If this contract had been executed on the date that it is purported to have been executed, according to the record, then the law on the 1st day of December, 1917, would control and not the law on the 7th day of November, 1918.

Mr. DENT. That is very true.

Mr. HULL. Mr. Dent, as I understand it, you believe that the Government should not make a contract with Mr. Ford, owing to the fact that the Alabama Power Co. has a prior right on the Gorgas plant; is that correct?

Mr. DENT. My proposition, Mr. Hull, is that the Government ought not to enter into a contract with Mr. Ford in accordance with the proposition as it is now pending, which includes the farming out, so to speak, of our property to Mr. Ford; that is, the steam plant at Gorgas.

Mr. HULL. Is the objection addressed to the steam plant or the transmission line?

Mr. DENT. It is both; they both belong to us.

Mr. HULL. The Government took the transmission line, did it not?

Mr. DENT. No. The Power Co. built it, but the Government loaned them the money during the war for that purpose.

Mr. HULL. Who owns the transmission line?

Mr. DENT. I think the Alabama Power Co. owns it, but the Alabama Power Co. was under contract to pay the Government for the value of the property that was put in there with its money.

Mr. HULL. The transmission line was not there before the war?

Mr. DENT. No; neither was the addition to the steam plant.

Mr. HULL. But the steam plant, as I understand it—and I do not know, of course—was so built that you can not take over one without taking over the other.

Mr. DENT. That is true.

Mr. HULL. But the transmission line is not in that shape, as I understand it.

Mr. DENT. As I said a little while ago, Mr. Hull, I am not an expert in matters of that kind, and I do not know anything about it; I suspect that that is true. It may be they could take over the transmission line without the plant, but that is not in my line, and I am not an expert on that subject.

Mr. HULL. I am simply trying to get the right angle on the proposition. It is very hard to understand it without seeing it.

Mr. JAMES. Mr. Dent, will you turn to part 3 of the hearings, at page 168? At the bottom of the page you will see what is marked "1st indorsement." When Mr. Quin read that a while ago, did I understand you to say that that was authority given by Maj. Gen. C. C. Williams to Lieut. Col. William Williams to sign the contract?

Mr. DENT. I did not know that Mr. Quin read this to me.

Mr. JAMES. You were asked that question.

Mr. DENT. Mr. Wurzbach asked me some questions as to whether there was any contract, whether the contracting officer had authority, and I referred to the memorandum at the bottom of the contract which is signed by Maj. Gen. C. C. Williams, Chief of Ordnance.

Mr. JAMES. Is this the exact language?

Mr. DENT. And I notice that you read it this morning to Mr. Martin.

Mr. JAMES. Do you think that is the authority of Gen. Williams given to Lieut. Col. Williams?

Mr. DENT. I would presume that is a written authority.

Mr. JAMES. That is a memorandum from the Chief of Ordnance to Col. Joyes.

Mr. DENT. Which one are you referring to, the one signed by C. C. Williams or the one signed by William Williams?

Mr. JAMES. The one marked "1st indorsement"; that is, the one you read in response to the question asked by Mr. Wurzbach as conferring upon Lieut. Col. William Williams authority to sign the contract.

Mr. DENT. Yes. That was the memorandum; I read that as a memorandum at the end of the contract showing that it was Gen. Williams's indorsement of the signing of the contract by Lieut. Col. Williams.

Mr. JAMES. But the communication is not to Lieut. Col. Williams, but to Col. Joyes.

Mr. DENT. That is because of the fact that Col. Joyes in this memorandum is designated as the contracting officer thereafter to carry out the contract, and that was signed by Gen. Williams.

Mr. JAMES. I asked Mr. Martin this morning if the communication just above that on the same page dated November 9, 1918, was the one in which Col. Williams gave his proxy to Col. Joyes to sign in his stead, and Mr. Martin said that had nothing to do with the contract, that it was simply a matter of form followed by the Army officers, and if that is true, then that means nothing else except that Col. Joyes is to relieve Col. Williams and has nothing to do with the contract, as Mr. Martin said this morning.

Mr. MARTIN. That is my impression, that at the time Col. Williams concluded the negotiations he was relieved so far as the performance of the contract was concerned, passing the authority to Col. Joyes.

Mr. JAMES. Then that brief indorsement does not confer any authority upon Col. Williams, but it simply means he was relieved by Col. Joyes, and it had nothing to do with the contract.

Mr. MARTIN. The communication marked "1st indorsement," as Mr. Dent points out, is the recognition by Gen. Williams of the fact of the execution of the contract by Lieut. Col. Williams.

Mr. JAMES. But it is not an order from Gen. Williams authorizing Col. Williams to sign any contract.

Mr. MARTIN. Undoubtedly there is such an order.

Mr. JAMES. If there is such an order, I think it must be in some other place.

Mr. DENT. If any question is raised about the authority of Col. Williams to sign the contract, I should like to produce Gen. Williams to make proof of that.

Mr. JAMES. Mr. Wurzbach raised that question.

Mr. DENT. It would be a question of but a short time to prove it. I thought it was in the record.

The CHAIRMAN. I had the impression that Gen. Williams did testify to that effect.

Mr. DENT. If the technical point is going to be raised we can easily overcome it by producing a witness himself who can testify to that. He has told me so himself, that the contract was properly executed and it ought to be carried out.

The CHAIRMAN. I will say this, that to-night I will read Gen. Williams's testimony, and if I find the testimony does not show affirmatively what he said regarding the matter we will give you notice and you can ask Gen. Williams to appear to testify in that regard.

Mr. CROWTHER. Take the last clause of the contract. I would like to ask whether this clause has anything to do with the date. It says, "In witness whereof the parties hereto have caused these presents to be executed and delivered in quadruplicate at Washington, D. C., the year and date above written."

Mr. DENT. That is simply a repetition of the first clause. The parties, in other words, can adopt any date they want to when they sign a contract, provided it is not signed on a Sunday or some day that is illegal. They can adopt any date they want to; but when it comes to the proof of the actual date of execution the law always permits the proof to be established by parole evidence.

Mr. CROWTHER. What is the meaning of this being delivered in quadruplicate at Washington?

Mr. DENT. I do not know.

Mr. CROWTHER. That was executed in New York, was it not?

Mr. DENT. Yes. I was not representing the power company at that time and I know nothing about it. I presume that the form of the contract was prepared with the idea that it would be signed in Washington, and written that way, and the parties happened to meet in New York and signed it there without making any change in it. They can also adopt the place as well as the time, but the proof as to the time can always be established by parole evidence.

Mr. CROWTHER. Your contention is and you would hold as a lawyer that this contract dated from the time of its signature in New York?

Mr. DENT. And delivery. Without that no contract is good. It has not only to be signed but delivered before it has any vitality.

Mr. CROWTHER. The date of December 1, 1917, does not mean anything, really.

Mr. DENT. It means nothing, except that the parties adopted it for some reason, I know not what; it may be because that was the date when the original transaction began.

Mr. DENT. That would be involved if they had not finally put the contract into written form and duly executed it. That applies as between individuals and not as between a party and the Government, on account of the fact that Government contracts must be executed in a certain way or otherwise they are void. I think that is the rule of the Comptroller of the Treasury.

Mr. GARRETT. If this contract had been executed on the date that it is purported to have been executed, according to the record, then the law on the 1st day of December, 1917, would control and not the law on the 7th day of November, 1918.

Mr. DENT. That is very true.

Mr. HULL. Mr. Dent, as I understand it, you believe that the Government should not make a contract with Mr. Ford, owing to the fact that the Alabama Power Co. has a prior right on the Gorgas plant; is that correct?

Mr. DENT. My proposition, Mr. Hull, is that the Government ought not to enter into a contract with Mr. Ford in accordance with the proposition as it is now pending, which includes the farming out, so to speak, of our property to Mr. Ford; that is, the steam plant at Gorgas.

Mr. HULL. Is the objection addressed to the steam plant or the transmission line?

Mr. DENT. It is both; they both belong to us.

Mr. HULL. The Government took the transmission line, did it not?

Mr. DENT. No. The Power Co. built it, but the Government loaned them the money during the war for that purpose.

Mr. HULL. Who owns the transmission line?

Mr. DENT. I think the Alabama Power Co. owns it, but the Alabama Power Co. was under contract to pay the Government for the value of the property that was put in there with its money.

Mr. HULL. The transmission line was not there before the war?

Mr. DENT. No; neither was the addition to the steam plant.

Mr. HULL. But the steam plant, as I understand it—and I do not know, of course—was so built that you can not take over one without taking over the other.

Mr. DENT. That is true.

Mr. HULL. But the transmission line is not in that shape, as I understand it.

Mr. DENT. As I said a little while ago, Mr. Hull, I am not an expert in matters of that kind, and I do not know anything about it; I suspect that that is true. It may be they could take over the transmission line without the plant, but that is not in my line, and I am not an expert on that subject.

Mr. HULL. I am simply trying to get the right angle on the proposition. It is very hard to understand it without seeing it.

Mr. JAMES. Mr. Dent, will you turn to part 3 of the hearings, at page 168? At the bottom of the page you will see what is marked "1st indorsement." When Mr. Quin read that a while ago, did I understand you to say that that was authority given by Maj. Gen. C. C. Williams to Lieut. Col. William Williams to sign the contract?

Mr. DENT. I did not know that Mr. Quin read this to me.

Mr. JAMES. You were asked that question.

Mr. DENT. Mr. Wurzbach asked me some questions as to whether there was any contract, whether the contracting officer had authority, and I referred to the memorandum at the bottom of the contract which is signed by Maj. Gen. C. C. Williams, Chief of Ordnance.

Mr. JAMES. Is this the exact language?

Mr. DENT. And I notice that you read it this morning to Mr. Martin.

Mr. JAMES. Do you think that is the authority of Gen. Williams given to Lieut. Col. Williams?

Mr. DENT. I would presume that is a written authority.

Mr. JAMES. That is a memorandum from the Chief of Ordnance to Col. Joyes.

Mr. DENT. Which one are you referring to, the one signed by C. C. Williams or the one signed by William Williams?

Mr. JAMES. The one marked "1st indorsement"; that is, the one you read in response to the question asked by Mr. Wurzbach as conferring upon Lieut. Col. William Williams authority to sign the contract.

Mr. DENT. Yes. That was the memorandum; I read that as a memorandum at the end of the contract showing that it was Gen. Williams's indorsement of the signing of the contract by Lieut. Col. Williams.

tial necessity—of having to use this plant to operate the nitrate plant at Muscle Shoals, which ultimately is to be operated, if you are going to operate this plant at all, according to the testimony before this committee, by water power.

Mr. STOLL. I know that, but I am talking about the purpose for which the United States Government spent this money to get this transmission line. If the Government is to still carry out this purpose, why is it not a part and parcel of it?

Mr. DENT. I think I can answer that by asking you a question, and that is, if the Government intended to use the Gorgas plant in connection with the further development of nitrogen from the air, why did the Government contract to sell the plant back to the Alabama Power Co. if the Government intended to use it as a permanent proposition?

Mr. STOLL. They had a very foolish officer to make that kind of a contract, in my opinion.

Mr. GARRETT. Mr. Dent, if the date of the contract between the Alabama Power Co. and the United States of America, as shown by the hearings, or if the contract, as a matter of fact, was executed on December 1, 1917, what law would have governed the rights of the parties?

Mr. DENT. The law then in existence, if there was any, and, as I recall, there was no law authorizing the contract at that time. If that was the true date—

Mr. GARRETT (Interposing). As a matter of fact, I understand that is not the true date, but that is the date the record shows.

In the statement you made a moment ago you said that the conversation, the correspondence, and the memoranda leading up to a written contract was the controlling thing, and that is generally accepted under the law of contracts. But to my mind that is not the thing before the committee. That is not the question involved as a general proposition.

The question I am trying to get at now is this: That these parties did reach by correspondence and memoranda, as shown here, an agreement, and that they began to operate under that agreement; and that then the contract was finally executed in New York instead of Washington, D. C., where it says it was executed, and that practically all the performance had been had.

Now, comes the question I want to have answered, which is this: If the minds of the parties reached a sufficient conclusion so that they could begin to operate and did operate under the contract that was actually executed at some future date, would not the law upon the date upon which they reached their understanding and began the work and began the execution of the contract, control the rights of the parties instead of the law that happened to be in force at the time of the actual final execution of the agreement?

Mr. DENT. I can not agree with that as a legal opinion. I am expressing my own legal opinion. My own opinion is that the final draft of the contract, duly executed by the parties, is the controlling evidence of the contract between the parties, and that all previous negotiations are merged into that written instrument.

Mr. GARRETT. But that is only the evidence of the contract.

Mr. DENT. Sure.

Mr. GARRETT. The contract had finally been executed and the work performed prior to its execution.

Mr. DENT. According to your argument, that contract does not amount to anything at all; it was a mere useless formality.

Mr. GARRETT. I am not expressing an opinion upon that, but I am trying to get at what the facts are. As a matter of fact, they performed all of the work they had to do without a written contract; is that not true?

Mr. DENT. Most of it; I understand Mr. Martin testified that when the contract was finally executed in November, 1918, 95 per cent of the work was done. But I contend that the fact that they did this, even under informal arrangements between them and the Government constituted sufficient consideration after the law was passed for the execution of that contract in November, and that contract is the final memorial of the agreement between the parties.

Mr. GARRETT. As a lawyer, let me ask you this question: If they performed work not under an executed contract, but under an agreement which was reached by correspondence, and memoranda, and telegrams, and letters, would not their rights then be on a question of quantum meruit and not on a question of specific contract execution?

Mr. CROWTHER. You glean from the questions that have been asked that some of the lawyers on the committee do not agree with that conclusion.

Mr. DENT. Yes.

Mr. CROWTHER. I think Mr. Garrett suggested that he did not agree with that.

Mr. DENT. Yes; Mr. Garrett seemed to have a different opinion.

Mr. FIELDS. Mr. Dent, I gather from following you that your contention is that the Gorgas steam plant does not come within the provisions of the national defense act, because it is not a part of plant No. 2 for the production of nitrates or necessary for the operations of plant No. 2.

Mr. DENT. Yes.

Mr. FIELDS. If the Government had continued the operation of plant No. 2 from the time it operated it up to this time and found that the Gorgas steam plant was essential to the operation of plant No. 2 there would be no question as to the Government's right to hold it.

Mr. DENT. If your premise is conceded that would be true, but that would be begging the question.

Mr. FIELDS. If they found that essential.

Mr. DENT. That is the very question we raised, that it is not essential.

Mr. FIELDS. I am trying to get this straight in my own mind. It has been my understanding—and I may have a wrong understanding—that this plant and the steam plant at nitrate plant No. 2 were both constructed with a view to using them to supplement the water power at the time of low water in the operation of the nitrate plant, if it should be operated by hydroelectric power in the future.

Mr. DENT. I think you are mistaken about the facts in regard to that.

Mr. FIELDS. Let us go back to the Government's operation. If the Government should have determined, after it had made a test of that plant, to continue the operation of that plant for the production of nitrogen for fertilizer, and found that the maintenance or the retention of the Gorgas plant was essential to the continuous operation of plant No. 2, evidently there would have been no question as to the right of the Government to hold that property?

Mr. DENT. That might be true, Mr. Fields, if your premise is conceded, that they found it absolutely essential to the maintenance of the plant. But you are overlooking, perhaps, this fact, that the company owned this plant at Gorgas prior to the time the Government went in there, and the Government simply put up the money for the equipment of that plant, and that plant still belongs to the company, subject only to the right of the Government to obtain power.

Mr. FIELDS. I base my premise upon the fact that the Government realized that it would need this power for the operation of nitrate plant No. 2.

Mr. DENT. You mean the permanent development at Muscle Shoals.

Mr. FIELDS. Whether it be permanent or temporary, because the line has not been drawn between temporary operation and permanent operation. Indeed it was for the operation of that plant, otherwise it would not have invested its money and built the transmission line.

Mr. DENT. I do not think that is correct. As I understand it, they added to the plant at Gorgas and loaned the money to build the transmission line so they could have energy pending the time their plants were under construction.

Mr. FIELDS. Is there anything in the contract stipulating the time when the Government shall discontinue the use of the Gorgas plant after the construction of the dam?

Mr. DENT. The contract, Mr. Fields, authorizes the power company at any time to purchase this additional equipment from the Government, even before the work at Muscle Shoals was finished, as I understand Mr. Martin.

Mr. FIELDS. That is, at any time after the Government determined to discontinue the plant?

Mr. DENT. No; at any time under the contract the Alabama Power Co., after the construction of this additional equipment and this transmission line, could have demanded of the Government, if they were ready to pay for it, that the property be sold to them upon the payment of the value, the Government reserving the right to demand of the power company that they continue to supply power, pending the construction of this plant at Muscle Shoals.

Mr. FIELDS. I have read the contract, and I am frank to say I overlooked that point in it.

Mr. DENT. That is the reason I asked Mr. Stoll that question, if he thought the Government intended to use this permanently, why is it they agreed to sell it to the Power Co.?

Mr. FIELDS. Here is the point that has been in my mind, if this plant paid for by the Government, and this transmission line paid for by the Government are essential to the continuous operation of nitrate plant No. 2 they might need to use this plant all the time and use it in time of low water, when they did not have sufficient hydroelectric power at Muscle Shoals—why it was not a part of the scheme under section 124 of the national defense act, and if the Government could hold it as such in the event the Government should determine to continue the operation of nitrate plant No. 2, what would be the difference between the Government and the Government's lessee?

Mr. DENT. There would not be any, but I do not concede your premise, because the contract, if it is going to be sustained, if it is valid, between the Government and the company, says on its face that the Government could not utilize this steam plant at Gorgas in connection with the permanent operation at Muscle Shoals, because it provided that it could demand of the power company that they purchase back the equipment that they added to the power company's property; and on the other hand, that the company had the right to demand of the Government that they sell it to them.

Mr. FIELDS. I remember that language, but I had the impression that that was in the event that the Government should determine not to use it.

Mr. DENT. There is no event; that is absolute. Those provisions are absolute and contain no condition whatever.

Mr. FIELDS. Going back to the contract of December 1, 1917, I am the member of the committee who referred to the meeting of the minds prior to the date of the signing of the contract to which you referred in your remarks to the committee. I am not a lawyer, as my former chairman well knows, and as a layman I get mixed on these things. Here is one thing you have not made clear to my mind yet. If that agreement of December 7, 1917, was not a contract, a legal, valid contract, where did the accounting officer of the Government have the authority to pay out money for work under that contract?

Mr. DENT. The only authority that I know of, Mr. Fields, is that he was acting under the various appropriations passed by Congress to carry on the war.

Mr. FIELDS. We know that the accounting officers are very particular about contracts as they relate to accounting purposes.

Mr. DENT. They were not so particular during the war.

Mr. FIELDS. Then, there is another thought that has been running through my mind. This act of July 9, 1918, under which you claim legal title, authorizes the Secretary of War to sell property, but does not authorize the Secretary of War to option property for future sale. From the legal point of view would there be any difference between the sale of property and the optioning of property?

Mr. DENT. I think not. The greater always includes the less, and in law the right to make a sale carries with it the right to make a contract for sale.

Mr. FIELDS. There is another thing that is not exactly clear in my mind, and that is whether that law gives the heads of the department, or vests in them, the right to sell, and give an absolute title to the property, or to sell it in the regular way and report the sale to Congress, as the Secretary of War has done in the case of the Ford proposition.

Mr. DENT. There is nothing in this act requiring any report to be made to Congress. There is an absolute right to the heads of the department to make a sale.

Mr. FIELDS. To give an absolute title?

Mr. DENT. Absolutely.

Mr. WURZBACH. I call your attention to article 32 of this contract. I suppose you are familiar with the terms. It provides: "The contractor shall, prior to December 1, 1918, furnish to the United States a bond in the sum of \$50,000, conditioned upon the full and faithful performance by the contractor of all terms, covenants, and conditions hereof in relation to construction work and upon the prompt payment to all persons supplying labor or materials in the prosecution of the construction work under this contract."

When was that bond given?

Mr. DENT. You will have to ask those questions of Mr. Martin. I am not familiar with the execution of this contract and the circumstances surrounding it. I know nothing more about it than what has been given in the testimony before the committee.

Mr. WURZBACH. I want to ask this question: It is claimed that this contract was executed on November 7, 1918. At that time practically all of the construction work had been completed.

Mr. DENT. That is what the testimony shows.

Mr. WURZBACH. The giving of a bond, or the provisions for the giving of a bond at that time—that is, in November, 1918, after the completion of the work—is a manifest absurdity of the contract, is it not?

Mr. DENT. It depends altogether on the bond. The terms and conditions of the bond might relate back.

Mr. WURZBACH. Is there not a very strong circumstance in the recital in that article that this contract, or at least that part of the contract, had been drafted a long time prior to November, 1918?

Mr. DENT. There is no question about that. As I understood Mr. Martin, there had been a number of drafts of this contract at various times.

Mr. WURZBACH. I did not get that very clearly from Mr. Martin. I think he finally suggested that this contract was prepared and drawn shortly before it was actually signed, in November, 1918.

Mr. DENT. This particular contract, but there had been various drafts of contracts involving this proposition, prior to that time. That is something I can not testify about.

Mr. WURZBACH. That provision in the contract was really senseless, under all the circumstances, was it not?

Mr. DENT. It looks to me like it might be, unless it was retroactive. Unless it was retroactive, the provisions did not go back to the inception of the work. That would depend on the conditions of the bond. Mr. Martin might answer that better than I can. I do not know the terms of the bond.

Mr. WURZBACH. How many drafts of this contract were actually made?

Mr. MARTIN. I could not tell you.

Mr. WURZBACH. Where are the drafts?

Mr. MARTIN. There were quite a number. I have several of them right here. In reference to the bond, the bond was executed after the execution of the contract on the 7th of November. The Government had a disbursing officer on the work, and the Government disbursing officer took care of practically all the disbursements. There were some disbursements which we were undertaking to take care of, some expenditures we did take care of in completing the work, which lasted over six months. We assumed certain obligations in the completion of the work.

Mr. WURZBACH. When was the bond actually given?

Mr. MARTIN. Some time in November.

Mr. WURZBACH. Between the execution of the contract and December 1, 1918?

Mr. MARTIN. Yes; before the December 1 date.

Mr. WURZBACH. In reply to a question with reference to the authority of Maj. Gen. C. C. Williams for the signing of this contract, the indorsement made on the contract which was read was the same indorsement read by Mr. James, was it not?

Mr. DENT. I think it is.

Mr. WURZBACH. Did you notice that the indorsement is dated November 12, 1918, five days after the Power Co. claims that the contract was actually executed?

Mr. DENT. I did.

Mr. WURZBACH. Clearly that could not have been authority to Col. Williams or Col. Joyes.

Mr. DENT. Not original authority; it could not have been original authority, but could have been treated as a ratification of the signing of the contract.

Mr. WURZBACH. If that is the true date of the order of Gen. C. C. Williams.

Mr. DENT. That is the true date.

Mr. WURZBACH. Then certainly that was not authority to anyone to sign a contract five days prior to that date.

Mr. DENT. That is true, that it was not original authority. But you will notice that order relieves Col. Williams and appoints Col. Joyes to carry out the provisions of the contract for the Government as contracting officer, and I contend that the true date being November 7, 1918, that the naming of Col. Joyes to succeed Col. Williams as contracting officer to carry out this contract is thereby a ratification of the signature of Col. Williams, although no original authority could be claimed for it.

Mr. FIELDS. This layman's mind of mine is not satisfied about this contract. In regard to the question that it does not become a contract until the date on which it is signed.

Mr. DENT. And delivered.

Mr. FIELDS. Here is the point that has been in my mind, if this plant paid for by the Government, and this transmission line paid for by the Government are essential to the continuous operation of nitrate plant No. 2 they might need to use this plant all the time and use it in time of low water, when they did not have sufficient hydroelectric power at Muscle Shoals—why it was not a part of the scheme under section 124 of the national defense act, and if the Government could hold it as such in the event the Government should determine to continue the operation of nitrate plant No. 2, what would be the difference between the Government and the Government's lessee?

Mr. DENT. There would not be any, but I do not concede your premise, because the contract, if it is going to be sustained, if it is valid, between the Government and the company, says on its face that the Government could not utilize this steam plant at Gorgas in connection with the permanent operation at Muscle Shoals, because it provided that it could demand of the power company that they purchase back the equipment that they added to the power company's property; and on the other hand, that the company had the right to demand of the Government that they sell it to them.

Mr. FIELDS. I remember that language, but I had the impression that that was in the event that the Government should determine not to use it.

Mr. DENT. There is no event; that is absolute. Those provisions are absolute and contain no condition whatever.

Mr. FIELDS. Going back to the contract of December 1, 1917, I am the member of the committee who referred to the meeting of the minds prior to the date of the signing of the contract to which you referred in your remarks to the committee. I am not a lawyer, as my former chairman well knows, and as a layman I get mixed on these things. Here is one thing you have not made clear to my mind yet. If that agreement of December 7, 1917, was not a contract, a legal, valid contract, where did the accounting officer of the Government have the authority to pay out money for work under that contract?

Mr. DENT. The only authority that I know of, Mr. Fields, is that he was acting under the various appropriations passed by Congress to carry on the war.

Mr. FIELDS. We know that the accounting officers are very particular about contracts as they relate to accounting purposes.

Mr. DENT. They were not so particular during the war.

Mr. FIELDS. Then, there is another thought that has been running through my mind. This act of July 9, 1918, under which you claim legal title, authorizes the Secretary of War to sell property, but does not authorize the Secretary of War to option property for future sale. From the legal point of view would there be any difference between the sale of property and the optioning of property?

Mr. DENT. I think not. The greater always includes the less, and in law the right to make a sale carries with it the right to make a contract for sale.

Mr. FIELDS. There is another thing that is not exactly clear in my mind, and that is whether that law gives the heads of the department, or vests in them, the right to sell, and give an absolute title to the property, or to sell it in the regular way and report the sale to Congress, as the Secretary of War has done in the case of the Ford proposition.

Mr. DENT. There is nothing in this act requiring any report to be made to Congress. There is an absolute right to the heads of the department to make a sale.

Mr. FIELDS. To give an absolute title?

Mr. DENT. Absolutely.

Mr. WUEZBACH. I call your attention to article 32 of this contract. I suppose you are familiar with the terms. It provides: "The contractor shall, prior to December 1, 1918, furnish to the United States a bond in the sum of \$50,000, conditioned upon the full and faithful performance by the contractor of all terms, covenants, and conditions hereof in relation to construction work and upon the prompt payment to all persons supplying labor or materials in the prosecution of the construction work under this contract."

When was that bond given?

Mr. DENT. You will have to ask those questions of Mr. Martin. I am not familiar with the execution of this contract and the circumstances surrounding it. I know nothing more about it than what has been given in the testimony before the committee.

Mr. WUEZBACH. I want to ask this question: It is claimed that this contract was executed on November 7, 1918. At that time practically all of the construction work had been completed.

Mr. FIELDS. I said enter into an unsigned agreement.

Mr. DENT. That would not have been valid under the law. An unsigned agreement is not valid against the Government, because of the statutory form required in making contracts with the Government.

Mr. MCKENZIE. We are very much obliged to you, Mr. Dent, for the statement you have made to the committee.

Mr. DENT. I am very much obliged to you, Mr. Chairman and gentlemen.

(Thereupon at 4.35 o'clock p. m. the committee adjourned to meet Tuesday, February 28, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Tuesday, February 28, 1922.

The committee met at 10.30 o'clock a. m., Hon. John C. McKenzie (acting chairman) presiding.

Mr. MCKENZIE. Gentlemen of the committee, Mr. Oliver, one of our colleagues, is present and desires to make a brief statement this morning. We will now hear Mr. Oliver.

**STATEMENT OF HON. WILLIAM B. OLIVER, A REPRESENTATIVE
IN CONGRESS FROM THE STATE OF ALABAMA.**

Mr. OLIVER. I appreciate very much, Mr. Chairman, this courtesy you extend me. I share, in common with the committee, a very high and sincere regard for our former distinguished colleague, Mr. Dent, but I differ very widely with Mr. Dent as to certain legal phases of the contract set up by the Alabama Power Co., and under which the company claims the exclusive right to purchase the Gorgas power plant and transmission lines now owned by the Government, and my purpose in requesting the committee's indulgence for a few minutes is simply to present some contrary views on the legal questions discussed by Mr. Dent.

I will state in this connection that it is the purpose of the Alabama delegation to ask the committee at a later day, when the hearings have been concluded on both offers, for a short time in which some one member may discuss the facts.

(Mr. Kahn at this point came into the committee room.)

Mr. MCKENZIE. Mr. Oliver, if you will pardon me, I wish to state to the members of the committee and the gentlemen present that this is the birthday of our honored chairman, and I am sure you will all join with me in wishing him many happy returns of the day. [Applause.]

Mr. OLIVER. I wish to join with Mr. McKenzie in extending my sincere congratulations, and I hope that the distinguished chairman will remain with us in Congress as long as Uncle Joe Cannon has.

In order that we may have some idea as to the power of the National Government to condemn, from a viewpoint entirely different from that announced by Mr. Dent, I will state that my study of the authorities leads me to conclude that there can really be no two opinions as to the power and extent of the National Government's power to condemn. It does not extend alone to property essential to the permanent operation of a Government project or plant, but it likewise extends with equal force to any property that may be economically necessary for the construction of such plant or project, or for the temporary operation thereof, and I think the authorities are uniform on that proposition.

Aside from that, the question was suggested by Mr. Martin in his statement, and also by Mr. Dent, that in all condemnation proceedings it must be shown to the court that there is a public necessity for the taking of the property sought to be condemned.

Now, when Congress directs that any property be taken in connection with a public project, such action by Congress precludes all further inquiry, gentlemen, into the question of necessity. I think the authorities are uniform on that proposition.

In other words, here is a plant at Muscle Shoals constructed, whether with the \$20,000,000 appropriated in the 1916 national defense act or not is immaterial, since confessedly it was constructed pursuant to the purpose and declared will of Congress as expressed in the 1916 act. It was to serve the Government both in time of war and in times of peace; in other words, it was not a plant built or authorized for a war emergency alone, but was a plant constructed for a broad

national purpose, continuing in war as well as in peace, and the steam-power unit at Gorgas and transmission lines therefrom were paid for and acquired by the Government for the purpose of economically aiding in the construction of the Muscle Shoals plant and for the operation of said plant.

You may say that perhaps that power was only to be used, as the officers thought, during the time that the locks were being constructed for the development of hydro-electric power; but the officers could not determine what use Congress or the Nation might later determine to make of a power adjunct to the plant at Muscle Shoals, paid for and constructed for the Government.

The point I make is that the Gorgas power unit was a plant to supply the electric energy and power to operate a national project, selected, set apart, and built pursuant to the directions of Congress, as expressed in the national defense act of 1916, and if now Congress should accept an offer providing for the maintenance and operation of that plant, so as to conserve the two national purposes, as expressed in the 1916 act, and in that connection should direct that this Gorgas plant be condemned and taken over, the necessity for thus taking it over could not arise in any court; because the action of Congress will be conclusive on that point as to any court inquiry hereafter, and I can not believe that any lawyer will assail or take issue with that proposition.

You gentlemen are familiar with that line of authorities, holding that, though valuable private or public rights or quasi public rights may have been acquired, if, afterwards, the State, in its wisdom through its legislative body, sees fit to open a public street through such property; that it has the right to do so. The leading case on that subject came up from Illinois, as Mr. McKenzie, I know, will recall, and went to the Supreme Court, and the court decided that the necessity was to be determined by the legislative body, where they saw fit to act, and their action was conclusive afterwards on any inquiry in the courts as to the necessity of taking the property designated in the act for the street.

Coming down to certain acts of Congress which Mr. Deut seems to lay stress on, and on which Mr. Martin, as I understand, bases altogether his contention that this is a legal contract, I wish to call your attention, before discussing the two acts of May 10, 1918, and July 9, 1918, to that clause or article of the contract, which they insist gives the Alabama Power Co. the exclusive right to purchase this property.

It is article 22 of the contract, and you will note that it only gives to the Government "at any time subsequent to three years after peace is declared" the right to call upon the Alabama Power Co. to purchase this plant; note the language—"three years subsequent to the declaration of peace." The Government until this three years has elapsed is denied all right to sell the property, but may after such time call on the Alabama Power Co. to purchase the plant. It develops from that article, as you read it, that the evident purpose of the Alabama Power Co. in thus seeking to require a postponement of the Government's right to sell this plant, was to reserve for itself the right to enjoy the use of it during such time, and the article undertakes to provide that the Government must pay a large amount for the use of current to be furnished the Government or its assignees. Thus contemplating that the Government, pending the time the power company had reserved for itself the use and possession of the Gorgas plant, might dispose of the plant at Muscle Shoals, and if so, this article undertakes to fix the charge that the assignee shall pay for current supplied from the Government steam plant at Gorgas, and which the Alabama Power Co. claims the exclusive right to operate or purchase until three years after peace is declared.

In a subsequent provision of that article, the Alabama Power Co. reserves the right at any time during this period, ending three years after peace is declared, to call upon the Government to sell the plant to it, and to credit as part payment on the value of the plant to be thus fixed by arbitration, if not agreed on, any amount to its (the Alabama Power Co.'s) credit out of the amount the Government or its assignee is required to pay for current supplied during such option period. The whole plan being that during the time the Government is deprived of its right to sell the power company may use the plant, selling current therefrom to the Government at a price so fixed in the contract that it might partly or wholly amortize the value of the plant, during the time the power company has reserved to itself the right to purchase, if it so elects.

But that is not the only remarkable thing in article 22 of the alleged contract. It provides that in the event the Government does not see fit to call on the Alabama Power Co., after this delayed time, to purchase, or in the event

the Alabama Power Co. fails to call on the Government to sell, that then the Government shall have as its only right the authority to remove the buildings, machinery, transmission lines, and other property. So that article of the contract does not necessarily show a complete sale at all; in other words, it shows that there may never be a sale under article 22 of the contract, and that the Government may, in future, take its property and move it off as personally.

When that statement as to article 22 is applied to the two acts in question, I think you will find the contention of Mr. Martin and of Mr. Dent to be wholly unsound, no matter how liberal may be your interpretation of the power conferred by Congress on the President or the head of an executive department of the Government to sell.

Let me, however, call your attention to a further fact. The act of May 10, 1918, and the act of July 9, 1918, relate alone to property acquired by the Government or purchased by the Government for the war emergency. These acts never had in contemplation, if you will read them, any property acquired by the Government for future use after the war was over, as the plant at Muscle Shoals was, because that plant was to be retained for all time to serve the country in peace as well as in war. So the acts of May 10, and July 9, 1918, conferred no authority on the President or the head of an executive department to sell the plant at Muscle Shoals or its power unit at Gorgas.

But it is not necessary to assume that in order to show the absolute fallacy of the contention of the Alabama Power Co. in this case. Take, for instance, the act of May 10, which Mr. Dent passed loosely over and said perhaps it did not apply, or he thought that the act of July 9 was fuller and he was not insisting so much on the May act, but I will read it in connection with the July 9 act:

"Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That during the existing emergency the President be, and he is hereby, authorized in his discretion and upon such terms as he shall deem expedient, through the head of any executive department, to sell any supplies, materials, and so on."

You will find that the words "supplies, materials, and so on" relate to war emergency supplies and could not by any stretch of the imagination relate to a plant constructed for permanent use by the Government in war as well as in peace time.

Now, evidently, when some one came to consider this act of May 10, they found that Congress had vested the power solely in the President, and had used the words "in his discretion and on terms to be fixed by him." The act of July 9 was evidently framed with a view to somewhat broaden that power, and since there is no contention on the part of the Alabama Power Co. that the President ever, in the exercise of his discretion, fixed the terms on which any property was to be sold, Mr. Dent well said, "We will pass that by." But he contends that under the act of July 9, 1918, the power was broadened as follows:

"That the President be, and he hereby is, authorized through the head of any executive department to sell, upon such terms as the head of such department shall deem expedient, to any person, partnership, association," describing likewise war emergency property.

I wish to call your attention first to the fact, and doubtless the members of the committee have already thought of it, that the term "executive department" has a well-defined meaning, and when Congress authorizes the President or the head of an executive department to do an act, you are not at a loss to know on whom Congress is conferring authority, and the changing heads of bureaus and of bureau establishments when such language is employed are never in the contemplation of Congress, nor can there be found any statute or any decision construing the words "head of an executive department" as designating a bureau or any subordinate agency of any of the executive departments.

The Revised Statutes, 158, 159, and 160, define an executive department to be 1 of the 10 departments of the Government, and when you say the President or the head of an executive department, of course, you mean the President or one of the Cabinet officers who is at the head of an executive department. We have but 10 executive departments, and throughout the Revised Statutes and throughout all the decisions, whether you take the decisions of the courts, or those of the comptroller in the past, or of the budget officer at present, they

have all uniformly recognized that the "head of an executive department" has reference alone to one of the 10 Cabinet officers of the Government. Congress would not in conferring important powers upon the President link therewith the words "or a bureau head" and thus give to the bureau head the same power given to the President. Of course the only department Congress linked with the President in the conferring of important powers by the July 9 act was a Cabinet officer, who alone is designated as the head of an executive department.

So this discussion by Mr. Dent and others as to whether Gen. Williams, of the Ordnance Bureau, gave any written authority to the reserve officer, Lieut. Col. Williams, to sign this alleged contract, is wholly irrelevant and immaterial, because you must show, if your contention is correct, that the head of an executive department had the right to sell this class of property, and if he delegated such authority, that it was properly delegated and such delegation confined to acts not involving judgment and discretion requiring the personal exercise or approval by the head of an executive department.

Now let us carry the analysis of this act of July 9 a little further, and I call your attention especially now to a proviso, important indeed, in determining the extent of the authority that Congress sought to confer even upon the President or the head of an executive department in the sale of war-time emergency-acquired property.

Congress did not when it passed that act. Mr. Chairman, leave it simply as a broad, unlimited authority conferred for all time to make sales, but it placed an important qualifying clause on the authority to sell in the act of July 9, 1918. The reason why I called your attention to what section 22 of the Alabama Power Co. contract provided, as to the postponement of the Government's right to sell, was to show that under this alleged contract with the Alabama Power Co. the Government is absolutely precluded from selling the Gorgas steam plant until three years after peace is declared. Now listen to the proviso and see whether that proviso has been or can be complied with by any officer seeking to bind the Government in what the Alabama Power Co. claims is an exclusive right given it to purchase.

"*Provided further*"—this is from the act of July 9, 1918—"Provided further, That a detailed report shall be made to Congress, on the first day of each regular session, of the sales of any war supplies, materials, lands, factories, or buildings and equipment sold under the authority contained in this or any other act, except sales made to any foreign state or government engaged in war against and government with which the United States is at war."

Making such foreign state or government the only exception, you understand.

"Showing the character of the article sold, to whom sold, the price received therefor, and the purpose for which sold."

How could an agent of the Government, whether the head of an executive department or the President, have complied with that proviso if the alleged contract of the Alabama Power Co. is valid? The Government under that contract can not elect to say, "I wish to sell this property" until three years have elapsed after peace. The Government by some agent has tied its hands, and yet Congress said that in the exercise of the power to sell emergency acquired property the agent on whom we confer authority to sell shall report to the next regular session of Congress; in this case that happened to be December, 1918, since it is claimed the sale was made in November, 1918; and then he must show what? The property sold, the party to whom sold, the purpose for which sold, and the amount received.

This certainly was a limitation, and served notice on the agent and on everyone dealing with the agent that the Government had authorized not a sale or an option to buy property three years after peace, but if any sale was made before December, 1918, the property sold, the party to whom sold, the purpose for which sold, and the amount received must be reported to the December session of Congress. If that be a binding contract, you then construe it as giving to the Alabama Power Co. the right to say to an emergency officer named Williams, "You need not sell us now the Gorgas plant, but you can postpone the Government's right to sell it at all to anyone until three years after peace," although Congress said in conferring authority to sell that the President or head of an executive department, as to all sales made, must report the purchaser and terms of said sale, including price received, to the next regular session of Congress, which as to their alleged sale would have required a report in December, 1918.

But that is not all. There is still another well understood and well recognized rule of law that would prevent an unconscionable contract like this from taking effect, and it is this:

Assume that all I have said in reference to the limitation of the agent to sell is untenable. I do not think it can be assailed, but just assume for the sake of argument that it is untenable, what more do we find has been attempted in this contract to violate the plain language of the act of July 9, 1918, which it is claimed confers authority upon the President or the head of an executive department to sell?

Why, when Congress conferred authority on the President or the head of an executive department to sell by the July 9 act, it clothed the President and the head of such executive department with important, personal responsibilities to be exercised in time of war, involving the selection of property which, without hurt, could be sold; the suitability of the party or Government to whom it could be safely sold; the price to be paid; and the purpose for which sold; yet, lo and behold, we find the Alabama Power Co. and an emergency Government officer entering into a contract whereby the Government has not reserved to the President or to the head of the executive department, who alone were clothed with authority to sell at a fixed price, any right to fix the price of the property; but the Government has postponed its right to sell for three years after peace is declared, and if the Alabama Power Co. elects to purchase under an option given it in such contract, and the price can not be agreed on, then the Alabama Power Co. under this alleged contract may appoint one of the arbitrators to determine the value of the property at such postponed date and the amount to be paid by the Alabama Power Co. therefor. It might be Mr. Martin himself, the man who helped to draw the contract, and assuming that he might be selected by the Alabama Power Co. to sit on this tribunal to fix the price the Government is to receive for this property, he shall have voice, equal with the agent to be appointed by the Government, in the selection of a third party, who together may determine the price the Alabama Power Co. shall pay.

Is there any man who ever studied law for a day that would for a moment contend that where you confer authority to sell large and valuable property upon an agent and confer it upon him and him alone, that the agent has the right, in the exercise of that authority to sell, to delegate to the party who is to buy, the right to appoint some one to fix the price? That is perfectly absurd, and there can be no sane, intelligent insistence that this anomalous contention of the Alabama Power Co., either through its president or its attorney, is tenable or would be enforceable in any court.

I thank you, gentlemen. I would be glad to answer any questions the committee may wish to ask.

Mr. MILLER. Mr. Oliver, you contend that in the act where it designates the President or the head of any executive department, that the head of the executive department can not delegate that power to anybody else?

Mr. OLIVER. I do not think he could delegate the power to the extent of having the price fixed, the property to be sold, the purchaser to whom sold determined by a subordinate.

Mr. MILLER. That is what I mean.

Mr. OLIVER. But even if that be incorrect there would have to be some delegation of that power regularly shown. I am very glad Mr. Miller asked that question, because as showing that even the Secretary of War understood that this alone conferred authority on him, and that before anything could be done pursuant to it there would have to be an order issued by him. I refer you to the order of Gen. Goethals which Mr. Martin read into the record and passed over rather hurriedly, and I am not surprised that he did not dwell on it, because it is against his contention. You will note that the order of Gen. Goethals is "by authority of the Secretary of War, Geo. W. Goethals, major general, Assistant Chief of Staff," and so on. So if there could be any delegation of this authority, it must be in that way by the head of an executive department.

There was evidently no difference of opinion in the War Department as to whom the head of the executive department was. Let me call your attention to that bulletin, as they call it, issued at that time, which was August 3, following the act of July 9, and so far from conferring upon any agent the right to deny to the Government the right to sell this property until three years after peace—and you will remember that that is the language of section 22—or to confer upon any purchaser the right to claim the exclusive right to buy it, if he so elects, let us see what Gen. Goethals said in that order:

have all uniformly recognized that the "head of an executive department" has reference alone to one of the 10 Cabinet officers of the Government. Congress would not in conferring important powers upon the President link therewith the words "or a bureau head" and thus give to the bureau head the same power given to the President. Of course the only department Congress linked with the President in the conferring of important powers by the July 9 act was a Cabinet officer, who alone is designated as the head of an executive department.

So this discussion by Mr. Dent and others as to whether Gen. Williams, of the Ordnance Bureau, gave any written authority to the reserve officer, Lieut. Col. Williams, to sign this alleged contract, is wholly irrelevant and immaterial, because you must show, if your contention is correct, that the head of an executive department had the right to sell this class of property, and if he delegated such authority, that it was properly delegated and such delegation confined to acts not involving judgment and discretion requiring the personal exercise or approval by the head of an executive department.

Now let us carry the analysis of this act of July 9 a little further, and I call your attention especially now to a proviso, important indeed, in determining the extent of the authority that Congress sought to confer even upon the President or the head of an executive department in the sale of war-time emergency-acquired property.

Congress did not when it passed that act, Mr. Chairman, leave it simply as a broad, unlimited authority conferred for all time to make sales, but it placed an important qualifying clause on the authority to sell in the act of July 9, 1918. The reason why I called your attention to what section 22 of the Alabama Power Co. contract provided, as to the postponement of the Government's right to sell, was to show that under this alleged contract with the Alabama Power Co. the Government is absolutely precluded from selling the Gorgas steam plant until three years after peace is declared. Now listen to the proviso and see whether that proviso has been or can be complied with by any officer seeking to bind the Government in what the Alabama Power Co. claims is an exclusive right given it to purchase.

"*Provided further*"—this is from the act of July 9, 1918—"Provided further, That a detailed report shall be made to Congress, on the first day of each regular session, of the sales of any war supplies, materials, lands, factories, or buildings and equipment sold under the authority contained in this or any other act, except sales made to any foreign state or government engaged in war against and government with which the United States is at war."

Making such foreign state or government the only exception, you understand.

"Showing the character of the article sold, to whom sold, the price received therefor, and the purpose for which sold."

How could an agent of the Government, whether the head of an executive department or the President, have complied with that proviso if the alleged contract of the Alabama Power Co. is valid? The Government under that contract can not elect to say, "I wish to sell this property" until three years have elapsed after peace. The Government by some agent has tied its hands, and yet Congress said that in the exercise of the power to sell emergency acquired property the agent on whom we confer authority to sell shall report to the next regular session of Congress; in this case that happened to be December, 1918, since it is claimed the sale was made in November, 1918; and then he must show what? The property sold, the party to whom sold, the purpose for which sold, and the amount received.

This certainly was a limitation, and served notice on the agent and on everyone dealing with the agent that the Government had authorized not a sale or an option to buy property three years after peace, but if any sale was made before December, 1918, the property sold, the party to whom sold, the purpose for which sold, and the amount received must be reported to the December session of Congress. If that be a binding contract, you then construe it as giving to the Alabama Power Co. the right to say to an emergency officer named Williams, "You need not sell us now the Gorgas plant, but you can postpone the Government's right to sell it at all to anyone until three years after peace," although Congress said in conferring authority to sell that the President or head of an executive department, as to all sales made, must report the purchaser and terms of said sale, including price received, to the next regular session of Congress, which as to their alleged sale would have required a report in December, 1918.

Mr. OLIVER. They could do it if Congress, in its wisdom, declared that that was necessary for the operation of the plant at Muscle Shoals, and the action of Congress, as I read the decisions on the question as to the necessity, would be conclusive.

Mr. KEARNS. I am quite clear in my own mind that the Government would have the right to condemn property of the Alabama Power Co. for its own use, but this would be a makeshift or a makebelieve, and that is the question that is in my mind. Possibly I am wrong, but I would like to hear about that.

Mr. OLIVER. I am very glad you have asked that question.

Mr. KEARNS. Could the Government do something for Mr. Ford that Mr. Ford could not do for himself; that is, condemn property that belongs to the Alabama Power Co. for Mr. Ford? The question in my mind is that it would not be exactly for governmental use and would be whipping the devil around the stump.

Mr. OLIVER. That is a very interesting and important question, and I recognize the pertinency and force of it.

Let me, however, call your attention to this fact before making answer, that this plant at Muscle Shoals is to serve the Government for the next 100 years even under the Ford contract. It is to serve the Government in the event of war and it is to serve the Government in time of peace if the Ford offer before you means anything. So the Government in making a sale to Mr. Ford or a lease to Mr. Ford of this power and of these plants, and in authorizing the taking over of the power plant at Gorgas, which has heretofore been used in connection with nitrate plant No. 2, is doing nothing but providing the necessary power for a governmental purpose, the governmental purpose having been declared in the national defense act of 1916. That is a broad governmental purpose, declared both for war as well as for peace, and so Mr. Ford, if you accept his contract, takes it subject to those national purposes fixed on the plant for the next 100 years or longer.

Mr. KEARNS. And that fact you think would justify or would give the Government a standing in court.

Mr. OLIVER. Yes; and Judge Tyson calls my attention to the fact of the Government's interest in navigation in connection therewith. It is also in connection with that important public use. I do not think there can be any question about it.

Mr. KEARNS. That is my opinion.

Mr. WURZBACH. Mr. Oliver, what do you consider the legal date of the termination of the war under the provisions of this contract?

Mr. OLIVER. The legal date of the termination of the war?

Mr. WURZBACH. Yes; when peace was declared.

Mr. OLIVER. My attention has been called by Mr. McDuffie to the fact that the contract itself provides, probably, that the date of the armistice shall determine that. I have not examined it, however, with that in view. That, as you know, is an open question, and in the absence of an express provision declaring the date of the armistice to be the date, perhaps it might not have been until after the President issued his proclamation of peace.

Mr. WURZBACH. Do you consider that the three-year period provided for in that contract has passed?

Mr. OLIVER. Taking their contention that it takes effect from November, 1918, when it was signed, you understand, and running up to November, 1921, it would have passed.

Mr. WURZBACH. The armistice was signed in November, 1918.

Mr. OLIVER. Yes.

Mr. WURZBACH. Then if that was the legal date the three-year period would have elapsed at this time.

Mr. OLIVER. Yes.

Mr. WURZBACH. Do you think as a lawyer, Mr. Oliver, that assuming that the Chief of Ordnance or an agent of the Government had power to act under this law of July, 1918, or May, 1918—

Mr. OLIVER (interposing). Unquestionably not.

Mr. WURZBACH (continuing). Had any power to sell, do you think that would include the power to provide against a sale or to prohibit a sale during a period of three years?

Mr. OLIVER. Unquestionably not; I do not think anyone will insist that it would. The power to sell would certainly not confer on the agent the power to postpone the right of the Government to sell for three years after peace, and this is what this contract does. In other words, in executing the power to sell,

"Where increased manufacturing facilities are constructed at the expense of the Government or where their cost is amortized in the price paid by the Government, the contract shall provide that title to such facilities shall vest in the United States. The contractor may agree to take such facilities at a fair value in diminution of the profits which he otherwise would make.

"Where title to increased manufacturing facilities vests in the United States the contract shall provide that the contractor may make written offer to the Government to purchase such facilities, whereupon, if the Government accepts such offer, the contractor shall become obligated to pay for such facilities at their appraised value at that time."

Is there any insistence here that this contract is a compliance with that, and let us read further:

"The contract shall further provide that if the contractor does not make or the Government does not accept such offer, the Government shall have the right to remove such facilities after the termination of the contract within a time reasonably sufficient to effect such removal. The contract may provide that the Government shall have an option at the termination of the contract to purchase at an appraised value the land on which such facilities are erected."

How carefully they avoided that, you understand, and certainly the contract they set up does not meet any of the conditions specified in the bulletin that I have thus far read.

Now, listen further:

"If, in case of such increased manufacturing facilities, it is desired to make a contract along lines different from those herein established, the approval of the superior board of review shall first be secured."

Is there any contention here that that was ever complied with? None at all. But the emergency officer, the lieutenant colonel, now in Japan, seems to have been the officer who exercised the authority that Congress conferred upon the President and the head of an executive department.

Mr. McKENZIE. Since Mr. Miller has asked that question, I would like to ask you one question, Mr. Oliver. As I understand you, one of your contentions is that under the peculiar conditions surrounding this plant, you maintain that the Government would have the power to condemn the rights of the Alabama Power Co. in this plant and take over the entire plant, and then the Government would be in position to sell it and deliver it to anybody else.

Mr. OLIVER. Either the entire plant or the plant the Government constructed there, without question, and I go further, Mr. McKenzie, and I think the authorities are not hard to find on that insistence, that where a party, situated as the Alabama Power Co. was, with the knowledge that they were impliedly charged with, and in this case expressly knew, of the right of the Government to condemn and take the whole property, if it desired, suffered or permitted money of the Government to be expended in the construction of a plant of this kind upon its property, and even selected the site or suffered it to be selected, that the power company could not be heard in condemnation proceedings to set up any claim as to consequential damages to the adjacent property.

Mr. McKENZIE. If I understand you, and I think I do, under the terms of the contract entered into with the Alabama Power Co., there can be no sale made until three years have elapsed after the declaration of peace.

Mr. OLIVER. Absolutely.

Mr. McKENZIE. And your contention is that the Government can condemn and can take possession of at least that part of the plant paid for by the Government without waiting for the expiration of the three-year period.

Mr. OLIVER. Absolutely.

Mr. McKENZIE. And in addition to that, if the plant is so constructed that the Government can not preserve its rights in any other way, then on the basis of economic justice to the Government, they can condemn the whole plant.

Mr. OLIVER. I do not question it, either condemn all or a part. I want, however, to qualify my answer by saying that, of course, I do not think that article 22 of the alleged contract is a binding agreement on the part of the Government.

Mr. KEARNS. Mr. Oliver, unfortunately, I did not hear all of your argument, but following the question of Mr. McKenzie with reference to the condemnation proceedings to be instituted by the Government, do you mean to say that the Government could exercise the right of condemnation at the Warrior plant that belonged entirely to the Alabama Power Co. prior to the time the Government stepped in?

MUSCLE SHOALS PROPOSITIONS.

Mr. STOLL. There is no provision in these acts whereby any party would be given a preferred right to buy as they now claim under this contract.

Mr. OLIVER. I think that statement of facts is conclusive as to the illegality of that clause of the contract.

May I make one further statement? There has been some adversion to an act known as the Dent Act, passed in 1919. It is not necessary to discuss that more than to call the committee's attention to it, I am sure. I think most of the members of the committee now were on the committee at the time that act was passed, and you are familiar with the fact that the purpose of that act was simply to authorize the adjustment and settlement of claims against the Government, and you very wisely fixed a limitation on the time when they could be adjusted, in that you placed a proviso in the act that the Secretary of War or the heads of other departments on whom you conferred this authority to adjust and settle should make a full report of all the claims settled and the terms of the same to the next session of Congress. It has absolutely no effect in a matter of this kind.

The CHAIRMAN. As I understand it, the law has expired by limitation.

Mr. OLIVER. Absolutely: the purpose of the law has been fully met and complied with, and it is not applicable.

The CHAIRMAN. We are very much obliged to you.

Mr. OLIVER. I appreciate very much your courtesy, Mr. Chairman.

ADDITIONAL STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO.

The CHAIRMAN. Mr. Martin, would you desire to go ahead with the proposition of the Alabama Power Co. at this time?

Mr. MARTIN. I am at your service, Mr. Chairman.

The CHAIRMAN. The committee would be very glad to hear what you have to say about the purchase or delivery of this property to you under the terms of your agreement, and I suggest, in the first place, that your letter to the Secretary of War, and the Secretary of War's letter to the Speaker of the House transmitting your offer be inserted in the record at this point and that they be read by the clerk of the committee.

Mr. MARTIN. May I ask, Mr. Chairman, before you leave the other branch of the question, that Mr. Dent might be heard by the committee on one or two questions which have been presented by Mr. Oliver? Mr. Dent, who is acting as our counsel, would like to have the privilege later on to appear and make a statement in reply to Mr. Oliver.

The CHAIRMAN. Is Mr. Dent present?

Mr. MARTIN. He is not present at the moment.

The CHAIRMAN. When do you think it will be possible for him to proceed? I want to prevent the two propositions being mixed. We ought to close the hearings on one entirely before we take up the other.

Mr. MARTIN. I will say this: That Mr. Dent is not here now, and he would have to read Mr. Oliver's remarks before he can answer. He will not be able to get them until this afternoon. If the committee wishes to hear him in advance of my statement, he will not be able to make his reply until to-morrow morning.

The CHAIRMAN. The committee will hear Mr. Dent to-morrow morning, and his statement will be placed in the printed record immediately following the statement of Mr. Oliver.

In the meantime we will be glad to hear you on the proposition submitted by the Alabama Power Co., and I will ask the clerk of the committee to read the letter of transmittal of the Secretary of War and also your offer made to the Secretary of War.

(The clerk of the committee read as follows:)

WAR DEPARTMENT.

Washington, February 21, 1922.

DEAR MR. SPEAKER: I forward herewith an offer, which I think worthy of consideration, made by the Alabama Power Co., proposing to complete the dam at Muscle Shoals and to administer the Government's property at that point, which, I think, should be referred to the committee having jurisdiction over this subject. This offer is accompanied by a letter of explanation.

My comments on this offer are as follows:

1. The company will take out a license under the Federal water power act to complete the dam, locks, and power house, at its own expense, with initial installation of approximately 240,000 horsepower, subsequent installation to be made as required by the Federal waterpower act to meet market demands. This has the advantage of relieving the Government of all further expenditures in connection with completing these structures.

2. The company offers to furnish the Government, or anyone it may designate, with free power in the amount of 100,000 secondary horsepower for the production of fertilizer and munitions of war and research in connection therewith; and if for any reason this use of the power is discontinued the company will purchase same. This feature of the offer has the advantage of providing the Government a return on the \$17,000,000 it now has invested in the water-power project.

3. The Government has an interest in the Warrior extension of the steam plant of the power company and certain other facilities, and it owns the steam plant at nitrate plant No. 2, all of which the company offers to purchase for \$5,000,000, less an amount to be agreed on to cover costs of locks and navigation structures at the Wilson Dam, which would be approximately \$2,500,000, thus realizing a substantial sum on the Government's war-time investment in these steam-plant facilities and at the same time placing them in the public service.

4. It is important here to note that the effect of this offer is to leave the Government in ownership of its two nitrate plants in the Muscle Shoals district, together with the Waco quarry, representing a war-time investment of some \$75,000,000. They may be retained or they may be disposed of by lease, or otherwise, for the manufacture of nitrates, for munitions of war, or fertilizer.

5. The power company offers to operate and maintain the dam, power plant, and gates. There is a distinct advantage to the Government in this part of the offer. In the period of 50 years there may be occasion for substantial repairs and maintenance to the dam and gates as well as the power plant.

6. By the terms of this offer the Wilson Dam property will be transferred to the licensee, who will complete the construction. The locks and navigation structures, when completed, are to be conveyed to the Government in fee. This feature of the offer has the advantage that it brings the entire property, represented by the Wilson Dam project, under local taxation laws.

7. The offer contains the further provision, based on section 16 of the Federal water-power act, for taking over and operating the water-power project by the United States, whenever the safety of the United States demands, for the manufacture of nitrates, explosives, or munitions of war, or for any other purposes involving the safety of the United States. This broad provision of the act is of special importance to the United States in view of the location of the nitrate plants at this community.

8. It is proposed by the power company to develop this project under the Federal water-power act, which limits the license to a 50-year term. There is reserved, by section 14 of the act, the right to recapture by the Government, at the end of that period, and if not so taken over by the Government, then, the State and municipalities have preference over others. In this important respect the offer conforms to our national policy.

9. The company agrees to begin construction promptly and to complete the same within a reasonable time. The construction must be begun and completed within the time prescribed in the license. If not begun, the license may be terminated upon order of the water power commission; and, if not completed, there is ample provision for protecting the rights of the Government in the situation. In addition, however, it is in the province of the Federal Power Commission to require such assurances and guaranties as may be necessary as to the financial ability of the licensee to complete its undertaking.

10. The Alabama Power Co. is a public utility. By the terms of the Federal water-power act, its rates, services, and security issues, are regulated by local authority, and if none exists, by the Federal Power Commission. These regulatory laws all provide for service to everyone without discrimination.

11. The Acting Judge Advocate General has expressed the opinion that the option claimed by the Air Nitrates Corporation, under its contract, is not a lawful option. If valid, it is an option on the plant as an entirety. It is believed that nothing in the option prevents substitutions in parts of the plant believed by the Government to be desirable. This offer substitutes power in amounts sufficient for the efficient operation of the plant for a plant to

produce this power and no injury is done to the nitrate plant as a whole. Moreover, the Air Nitrates Corporation option arises only in case the United States determines to dispose of the plant as an entirety. Accordingly, even if the option is valid, it would seem not to interfere with the acceptance of this offer.

12. This offer makes no provision for Dam No. 3. To provide for the local requirements there is probably no necessity for the construction of this dam at this time; but, in case the local demand and the requirements of navigation develop, there would be no difficulty in providing for the financing of Dam No. 3 on reasonably fair terms.

Yours, very truly,

JOHN W. WEEKS.

Secretary of War.

The SPEAKER OF THE HOUSE OF REPRESENTATIVES.

ALABAMA POWER CO.,

Birmingham, Ala., February 15, 1922.

HON. JOHN W. WEEKS,

Secretary of War, Washington, D. C.

SIR: This company offers to carry out the following plan by which the Wilson Dam at Muscle Shoals may be completed and the nitrate problem of the Government in connection therewith may be simplified without further advances or expenditures by the United States.

1. To take out a license under the Federal water power act under which we will complete the construction of the dam, locks, and powerhouse at Muscle Shoals, known as Wilson Dam, or Dam No. 2, at our own expense, with initial installation to be made in accordance with the Federal water power act as may be necessary to meet the market demands.

2. To furnish free to the Government, or anyone it may designate, from the hydropower plant 100,000 horsepower, as required for the production of fertilizers and munitions of war and for research in connection therewith: and if, due to changes in the art, this use of such 100,000 horsepower is discontinued by the Government, the Alabama Power Co. to purchase and pay for the same in accordance with a schedule to be set forth in the license. This power to be the second 100,000 horsepower at any time available from the normal flow of the river.

3. To purchase the Government's interest in the Warrior extension of the steam plant of Alabama Power Co. and facilities, the Warrior and Sheffield substations, the transmission line from Warrior to Sheffield, and the steam plant at nitrate plant No. 2, together with the necessary rights of way, lands, and housing facilities, and to pay therefor in five equal installments and the sum of \$5,000,000, less an amount to be agreed on to cover the cost of locks and navigation structures at Wilson Dam, the first payment to be made when license is granted, the remaining payments to be made in four equal annual instalments with interest at 5 per cent, with the right to anticipate any part or all of same.

4. To operate and maintain the power plant, dam, and gates, the Government to operate and maintain the locks, for which the power company will supply the necessary power without expense to the Government.

5. The Government to transfer to the licensee the Wilson Dam property represented by its investment and commitments to date, free of liabilities and unincumbered, including the construction plant. The locks and navigation structures to be conveyed to the Government in fee on completion of construction.

6. Whenever the safety of the United States demands the United States shall have the right, as more fully provided in the Federal water power act, to take over and operate the project covered by the license for the purpose of manufacturing nitrates, explosives, or munitions of war, or for any other purpose involving the safety of the United States, for such length of time as may appear to the President necessary for such purposes.

7. The project covered by the license to be subject to recapture by the Government at the end of 50 years under the terms of the Federal water power act.

8. The licensee will agree to begin the construction promptly upon the enactment of the necessary legislation and granting of license and to complete the same within a reasonable time thereafter.

Mr. OLIVER. I do not think there is any question about that. I, perhaps, answered that too hastily. There is a principle of law that where an agent, without any authority makes a sale for his principal, exceeding his authority, and the principal when it is brought to his attention, expressly ratifies it, then the party entering into the contract with the agent is estopped from denying to the principal the right to affirm. So I answer with that qualification, but that would be purely a reservation for the benefit of the principal which, in this case, would be Congress.

Mr. QUIN. The fact that there was an interlocking interest of the Alabama Power Co. with the Government's power plant, making it a partner in the operation for the future, under the language of the act, would that be void?

Mr. OLIVER. I do not think there is any question but what it would not be available to the Alabama Power Co.

I have no doubt but what Congress has a right to condemn that plant and that these fancied damages that the gentleman has alluded to will appear as myths. There is nothing to them. You can not suffer the Government to expend \$5,000,000 on your property, at a place you consented and permitted it to be spent, and then come in and threaten the Government in the event it institutes condemnation proceedings so as to acquire and utilize that property in the future as it has been utilized in the past for governmental purposes. that you will claim, large, consequential damages. There could not be any principle of law sounder than that the Alabama Power Co. will be limited to very small consequential damages under those circumstances.

Mr. FISHER. Do I understand that it is your suggestion that the proper procedure would be that if the Congress should determine to accept another offer than the Alabama Power Co., that the Congress should pass a mandatory provision or a mandatory law directing that condemnation proceedings be instituted to get the title for the Government to the property upon which the Gorgas plant is built?

Mr. OLIVER. Oh, absolutely.

Mr. FISHER. Separating the plant as built after the Government entered into the contract with the Alabama Power Co. from the plant which was originally there.

Mr. OLIVER. You have the description here and you can get that very clearly.

Mr. FISHER. Have you any idea what those condemnation proceedings would cost?

Mr. OLIVER. As I said a few moments ago, I think Congress would be perfectly justified in appropriating a reasonable sum. Of course, I know you would fix a fair and just amount.

Mr. FISHER. You mean at the same time they passed a law directing the condemnation they would pass an appropriation limiting the amount of money that could be paid.

Mr. OLIVER. If you desired you could do that at that time, but if the assessment exceeded the appropriation it would afterwards be provided.

Mr. WRIGHT. Taking the situation as we find it, suppose the Government should now convey to somebody perhaps all of its right, title, and interest in the Gorgas plant and transmission line, and that the purchaser was subrogated to all the rights of the Government in the premises; what kind of a title do you think the purchaser would get?

Mr. OLIVER. I question whether or not that would be acceptable to any purchaser. I do not think any purchaser would take it that way.

Mr. WRIGHT. As a matter of law, I wanted to get your opinion as to what interest the purchaser would get.

Mr. OLIVER. I would not like to answer that offhand. I am afraid it might embarrass him in the proper assertion of a perfectly proper and legal right and largely postpone the enjoyment of the property, which is most essential to the economical operation of a plant to be used for an important governmental purpose, if you elect to require the production of fertilizer. That is my opinion.

Mr. STOLL. Mr. Oliver, the acts of May 10 and July 9, to which you referred, gave the executive heads of the departments the right to sell certain real estate, and so on. Did they give them the right to option property, thereby giving one person a preferred right for a period of years to buy?

Mr. OLIVER. I do not think anyone will insist they do.

Mr. STOLL. This contract of the Alabama Power Co. is not for a sale, but it is for an option on their part to buy.

Mr. OLIVER. Absolutely.

Financial conditions have so far improved that we are now able to offer to complete the Wilson Dam and power project without cost to the Government, except for its locks.

We are assured by a number of important industrial enterprises that if the power from this development becomes available to the public they will establish new plants and factories in this locality. This, with the rapid growth of industries in the region which may be economically served—a territory larger than New England—is such that we are confident the entire power output will be promptly absorbed. If the Muscle Shoals power can be made available for everybody, we believe that not only will a number of new industries be established at or near Muscle Shoals but the industrial development of Alabama, Tennessee, Georgia, North and South Carolina, and, indeed, of the entire South, will be promoted. Hence our willingness to assume the large responsibilities involved in our offer.

The Government has invested more than \$70,000,000 in the two nitrate plants and the lime quarry, and it appears that one or both of these plants are essential for the production of nitrates for war purposes and useful for fertilizer production. Our proposal leaves the Government in full title and possession of these plants and the quarry, to give it 100,000 horsepower and from two to five million dollars in cash for the operation thereof and for carrying on experiments in connection therewith. The Government will then be in position to turn over the two plants, with power and money for the operation thereof, to anyone capable of meeting the requirements of the Government and the farmers for nitrates and fertilizers, or the Government may retain the properties and itself carry on such experiments and manufactures as it sees fit. The Government can dispose of the plants in perpetuity for a long period of years or for a short period of years, and it should be able, with the free use of modern plants, no taxes, no power charges, and even with the free use of working capital, to attract the best skill and talent to be found.

The art of producing nitrates is still in its infancy and may so develop that in a few years these plants and this power will not be needed for producing either nitrates for war purposes or fertilizers. Our plan provides that in case the use of 100,000 horsepower is discontinued by the Government we will purchase that power from the Government and the proceeds will then be available for any use desired by the Government, including the amortization of its present investment in this situation.

We propose to take a license under the Federal water power act. This act provides for a 50-year license with the right of the Government to recapture the property at the end of the license period. It requires the licensee to operate and maintain the power plant, dam, and gates at its own expense, to make all necessary renewals and replacements, and it permits the Government to operate and maintain the locks, power to be furnished free for this purpose by the licensee. Of special importance in this situation is the requirement that the licensee shall contribute to the cost of improvements in the headwaters of the river made either by the Government or by another licensee. This insures our cooperation in opening the upper reaches of the river to navigation and improvement.

This great project should be completed and at the earliest possible date coordinated with the power demands of the very extensive territory covering seven States within the reach of power from this source. The maximum value can be drawn from these Tennessee River possibilities only through their coordination with the power and reservoir opportunities on other rivers in Alabama and adjacent States now in process of progressive development in the different watersheds. Such is the conclusion in the report entitled "The power situation during the war," submitted to the Secretary of War in 1921, through the Chief of Engineers, from which we quote as follows:

"150. It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States, and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will supplement each other for economy of construction and operation."

Very respectfully,

ALABAMA POWER CO.,
By THOS. W. MARTIN, *President*.

(Thereupon the committee took a recess until 2.30 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2.30 o'clock p. m.

The CHAIRMAN. The committee will please come to order.

Mr. OLIVER. Mr. Chairman, I was inaccurate in one statement this morning as to the law, and I desire to ask permission to withdraw it. It was a statement which I rather hurriedly made. I think, in response to a question as to fixing a limitation on the amount in the event condemnation proceedings were begun. I do not think it would be proper to fix a limitation, and I simply want to withdraw that statement.

The CHAIRMAN. If there is no objection, Mr. Oliver, you may withdraw that.

Mr. OLIVER. Thank you.

ADDITIONAL STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT OF THE ALABAMA POWER CO.—Resumed.

The CHAIRMAN. Mr. Martin, we will be very glad to hear such explanation of your offer made through the Secretary of War as you desire to make, and you may proceed in your own way and state the matter as you think best.

Mr. MARTIN. Thank you, Mr. Chairman. I stated to the committee, Mr. Chairman, a day or two ago that in 1912 Mr. James Mitchell arranged to take over certain undeveloped power situations in Alabama which at that time were owned by citizens of that State principally.

Among those situations was the Muscle Shoals undeveloped power. There was in existence at that time a company known as the Muscle Shoals Hydroelectric Power Co. This company was organized in 1906 by citizens of Alabama, and purchased from time to time properties along the Tennessee River, with the view of their ultimate development. Among those interested in that company prior to 1912 was Mr. J. W. Worthington, who has appeared before the committee. Mr. Worthington sold his interests, along with the other stockholders, to Mr. Mitchell and associates, but continued as an officer of that company until his resignation in February, 1920. Meanwhile he had been connected with the Alabama Power Co. His direct connection with that company as an officer of the company was terminated some time in the fall of 1915, but he continued as president of the Muscle Shoals Co. until, as I stated, February, 1920.

The CHAIRMAN. You say he continued as president of the Muscle Shoals company?

Mr. MARTIN. Yes, sir; until February, 1920.

The CHAIRMAN. What was the Muscle Shoals company? Was it a separate organization?

Mr. MARTIN. Yes, sir. The Muscle Shoals Hydroelectric Power Co. was a separate and distinct corporation, which corporation acquired these undeveloped sites on the Tennessee River. The stock of that corporation was acquired by Mr. Mitchell and associates in 1912, but the Muscle Shoals Hydroelectric Power Co. continued as a separate corporation, having its own organization and officers, and so it is to-day a distinct corporation.

Now that corporation had its activities, but they were limited to some plan of development of the power at the Muscle Shoals, and as president of that company Mr. Worthington remained in charge of its affairs, or practically in charge of its affairs, until his resignation in February, 1920.

The plan of development of the Muscle Shoals situation was somewhat along this line: As has been explained to you, the Tennessee River is a very flashy stream. The water flow varies from a minimum of 7,000 cubic feet per second at certain seasons to some four or five hundred thousands cubic feet per second at extreme high water. The result of that was to cause those interested in this development long ago to feel that its true economic development lay along some line of coordinating this Muscle Shoals development with some large storage development, a development which would store the flood waters in some other watershed, to be released in time of the Tennessee River low water, supplementing, of course, that low water.

Prior to 1912 Mr. Worthington and his several associates not only became interested in the Muscle Shoals Hydro Electric Power Co., but also became interested in another company known as the Birmingham, Montgomery & Gulf Power Co., a corporation organized under the laws of Alabama, and this Birmingham, Montgomery & Gulf Power Co. acquired a site on the Tallapoosa

Financial conditions have so far improved that we are now able to offer to complete the Wilson Dam and power project without cost to the Government, except for its locks.

We are assured by a number of important industrial enterprises that if the power from this development becomes available to the public they will establish new plants and factories in this locality. This, with the rapid growth of industries in the region which may be economically served—a territory larger than New England—is such that we are confident the entire power output will be promptly absorbed. If the Muscle Shoals power can be made available for everybody, we believe that not only will a number of new industries be established at or near Muscle Shoals but the industrial development of Alabama, Tennessee, Georgia, North and South Carolina, and, indeed, of the entire South, will be promoted. Hence our willingness to assume the large responsibilities involved in our offer.

The Government has invested more than \$70,000,000 in the two nitrate plants and the lime quarry, and it appears that one or both of these plants are essential for the production of nitrates for war purposes and useful for fertilizer production. Our proposal leaves the Government in full title and possession of these plants and the quarry, to give it 100,000 horsepower and from two to five million dollars in cash for the operation thereof and for carrying on experiments in connection therewith. The Government will then be in position to turn over the two plants, with power and money for the operation thereof, to anyone capable of meeting the requirements of the Government and the farmers for nitrates and fertilizers, or the Government may retain the properties and itself carry on such experiments and manufactures as it sees fit. The Government can dispose of the plants in perpetuity for a long period of years or for a short period of years, and it should be able, with the free use of modern plants, no taxes, no power charges, and even with the free use of working capital, to attract the best skill and talent to be found.

The art of producing nitrates is still in its infancy and may so develop that in a few years these plants and this power will not be needed for producing either nitrates for war purposes or fertilizers. Our plan provides that in case the use of 100,000 horsepower is discontinued by the Government we will purchase that power from the Government and the proceeds will then be available for any use desired by the Government, including the amortization of its present investment in this situation.

We propose to take a license under the Federal water power act. This act provides for a 50-year license with the right of the Government to recapture the property at the end of the license period. It requires the licensee to operate and maintain the power plant, dam, and gates at its own expense, to make all necessary renewals and replacements, and it permits the Government to operate and maintain the locks, power to be furnished free for this purpose by the licensee. Of special importance in this situation is the requirement that the licensee shall contribute to the cost of improvements in the headwaters of the river made either by the Government or by another licensee. This insures our cooperation in opening the upper reaches of the river to navigation and improvement.

This great project should be completed and at the earliest possible date co-ordinated with the power demands of the very extensive territory covering seven States within the reach of power from this source. The maximum value can be drawn from these Tennessee River possibilities only through their co-ordination with the power and reservoir opportunities on other rivers in Alabama and adjacent States now in process of progressive development in the different watersheds. Such is the conclusion in the report entitled "The power situation during the war," submitted to the Secretary of War in 1921, through the Chief of Engineers, from which we quote as follows:

"150. It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States, and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will meet each other for economy of construction and operation."

Very respectfully,

(Thereupon the commit

To facilitate the carrying out of this plan, we may find it necessary to organize a new company for the purpose, in which case, however, the obligations of this offer shall be binding upon this company in all respects as if it were the licensee.

Very respectfully,

ALABAMA POWER Co.,
By THOS. W. MARTIN, *President.*

ALABAMA POWER Co.,
Birmingham, Ala., February 15, 1922.

Hon. JOHN W. WEEKS,
Secretary of War, Washington, D. C.

SIR: In accordance with the offer which we have to-day submitted to you with reference to completing the Wilson Dam at Muscle Shoals, we beg to make the following statement:

For many years the Alabama Power Co. has been serving electricity to the industries and the public in Alabama. It is an Alabama corporation, having several thousand stockholders in Alabama. It has now more than 17,000 customers and serves more than 50 municipalities. It has more than 1,500 miles of transmission lines, an installed electric-generating capacity of 175,000 horsepower, and is engaged in constructing a new hydroelectric plant on the Coosa River of 110,000-horsepower capacity under a 50-year license granted by the Federal Power Commission. Its facilities are now being used to supplement the power supply in Tennessee, Georgia, and South Carolina, and even as far away as North Carolina, 600 miles distant, and can be used in even more distant localities.

For many years this company has been identified with the Muscle Shoals situation. For several years before the war it had owned the site of the Wilson Dam, and at the outbreak of the war it was actually proceeding with plans for a power development at this point. These plans were made with the active cooperation of the engineers of the War Department, and their approval appears in House Document No. 20, Sixty-third Congress, second session, and House Document No. 1264, Sixty-fourth Congress, first session.

After this country entered the war the Government desired the site for war purposes. We thereupon donated the site to the Government and transferred to it for \$1 titles and rights in connection with which we had already spent just under \$500,000.

We still own dam site No. 3 and certain lands in connection therewith.

The Government being also then in need of power beyond our available capacity, and time being of the first importance, we in like manner turned over to the Government, upon its request, the use of foundations and underwater structures then in reserve for our own use and enabled the Government to build thereon a 30,000-kilowatt extension to our Warrior River steam plant to be operated in conjunction therewith, and at the same time we placed a right of way owned by the company at the disposal of the Government for building a transmission line from Warrior to Muscle Shoals, a distance of some 90 miles. This enabled the Government to quickly secure the large amount of power required for constructing and operating the nitrate plants at Muscle Shoals. An agreement was signed between the Government and the company in November, 1918, binding the company to purchase this property from the Government after the termination of the war at a fair value.

When, in April, 1921, the War Department inquired concerning the feasibility of completing the Muscle Shoals development, we expressed the opinion that the project was an economical and profitable undertaking and promised that when the Government determined to complete it for commercial purposes the Government might rely upon the cooperation of this company. Recent discussions in Congress indicate that the Government is now prepared to devote this power to industrial uses, and it is, therefore, appropriate for this company now to offer its suggestions.

In formulating our plan we have sought to meet the requirements of the Government—first, in the desire to produce cheap fertilizers; second, to have nitrates available in time of war; third, to contribute to the industrial development of the region both by bringing in new industries and opening up navigation on the Tennessee River; and, finally, to complete the project without further expense to the Government.

Financial conditions have so far improved that we are now able to offer to complete the Wilson Dam and power project without cost to the Government, except for its locks.

We are assured by a number of important industrial enterprises that if the power from this development becomes available to the public they will establish new plants and factories in this locality. This, with the rapid growth of industries in the region which may be economically served—a territory larger than New England—is such that we are confident the entire power output will be promptly absorbed. If the Muscle Shoals power can be made available for everybody, we believe that not only will a number of new industries be established at or near Muscle Shoals but the industrial development of Alabama, Tennessee, Georgia, North and South Carolina, and, indeed, of the entire South, will be promoted. Hence our willingness to assume the large responsibilities involved in our offer.

The Government has invested more than \$70,000,000 in the two nitrate plants and the lime quarry, and it appears that one or both of these plants are essential for the production of nitrates for war purposes and useful for fertilizer production. Our proposal leaves the Government in full title and possession of these plants and the quarry, to give it 100,000 horsepower and from two to five million dollars in cash for the operation thereof and for carrying on experiments in connection therewith. The Government will then be in position to turn over the two plants, with power and money for the operation thereof, to anyone capable of meeting the requirements of the Government and the farmers for nitrates and fertilizers, or the Government may retain the properties and itself carry on such experiments and manufactures as it sees fit. The Government can dispose of the plants in perpetuity for a long period of years or for a short period of years, and it should be able, with the free use of modern plants, no taxes, no power charges, and even with the free use of working capital, to attract the best skill and talent to be found.

The art of producing nitrates is still in its infancy and may so develop that in a few years these plants and this power will not be needed for producing either nitrates for war purposes or fertilizers. Our plan provides that in case the use of 100,000 horsepower is discontinued by the Government we will purchase that power from the Government and the proceeds will then be available for any use desired by the Government, including the amortization of its present investment in this situation.

We propose to take a license under the Federal water power act. This act provides for a 50-year license with the right of the Government to recapture the property at the end of the license period. It requires the licensee to operate and maintain the power plant, dam, and gates at its own expense, to make all necessary renewals and replacements, and it permits the Government to operate and maintain the locks, power to be furnished free for this purpose by the licensee. Of special importance in this situation is the requirement that the licensee shall contribute to the cost of improvements in the headwaters of the river made either by the Government or by another licensee. This insures our cooperation in opening the upper reaches of the river to navigation and improvement.

This great project should be completed and at the earliest possible date coordinated with the power demands of the very extensive territory covering seven States within the reach of power from this source. The maximum value can be drawn from these Tennessee River possibilities only through their coordination with the power and reservoir opportunities on other rivers in Alabama and adjacent States now in process of progressive development in the different watersheds. Such is the conclusion in the report entitled "The power situation during the war," submitted to the Secretary of War in 1921, through the Chief of Engineers, from which we quote as follows:

"150. It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States, and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will supplement each other for economy of construction and operation."

Very respectfully,

ALABAMA POWER CO.,
By THOS. W. MARTIN, *President*.

(Thereupon the committee took a recess until 2.30 o'clock p. m.)

house substructures, and miscellaneous and engineering expenses, in connection with these items, together with a contingent and interest fund of \$1,000,000, will be \$17,349,100. Our plans are based on the gravity dam, sections, adopted by your board for Dams Nos. 2 and 4, and upon unit prices, which we believe, in the light of our recent experience, are more than ample, and which we hope and believe will commend themselves to you as safe.

The Muscle Shoals Hydroelectric Power Co. respectfully submits to your board the following proposals based upon the conditions therewith stated:

1. That the Government shall complete the dam at site No. 2 and the appurtenances thereto mentioned above and permanently raise the waters behind the said dam to the level of the spillway thereof within four years after the date of the first appropriation made for the carrying out of the project and not later than the 1st of January, 1919, and for a sufficiently long period of time prior to that date give entrance to the Muscle Shoals Co. for the completion by it, at its expense, of the power-house superstructures and the initial hydraulic and electrical equipment by that time.

That the Government shall complete the dam at Site No. 4 and the appurtenances thereby mentioned above and permanently raise the waters behind the said dam to the level of the spillway thereof within five years after the date of the first appropriation made for the carrying out of the project and not later than the 1st of January, 1920, and for a sufficiently long period of time prior to that date give entrance to the Muscle Shoals Co. for the completion by it, at its expense, of the power-house superstructures and the initial hydraulic and electrical equipment by that time.

2. The Muscle Shoals Co., upon the completion of the dam at Site No. 2 and the appurtenances mentioned above and the permanent raising of the waters behind said dam to the level of the spillway thereof, will pay to the Government the sum of \$3,000,000 in cash as its first contribution to the cost of the lands, docks, dams, and substructures.

3. The Muscle Shoals Co., within a period of 100 years from the completion of the dam at site No. 2 and appurtenances thereto mentioned above and the permanent raising of the waters behind the said dam to the level of the spillway thereof, will repay to the Government as its second contribution for lands, locks, dams, and substructures \$7,000,000, by an annual payment of sinking fund and interest, taken at the approximate rate of 3 per cent per annum and in specific amounts, to be paid as follows:

At the end of the first year after the completion of the dam at site No.

4 and the appurtenances thereto, mentioned above, and the permanent raising of the water behind said dam to the level of the spillway thereof.....	\$75, 000
At the end of the second year.....	125, 000
At the end of the third year.....	150, 000
At the end of the fourth year.....	175, 000
At the end of the fifth year.....	200, 000
And each year thereafter to the close of the 100-year period.....	240, 000

4. The Muscle Shoals Co., as its third contribution in aid of navigation, will pay to the Government each year an amount equivalent to 30 cents per horsepower of installed capacity measured on the switchboards of the power houses. Such payments shall begin at the end of the first year after the said installed capacity shall exceed 200,000 horsepower, but not later, in any event, than at the end of 20 years from the beginning of the said 100-year period, and shall continue to the end of the said period.

5. The Muscle Shoals Hydro-Electric Co., upon the invitation of the United States Government, at any reasonable time prior to the expiration of the said period of 100 years will undertake negotiations with the Government looking to a renewal of this lease. In the event of failure to agree upon terms, this lease shall terminate at the end of said period of 100 years, and the Government shall then take possession of all the property of the Muscle Shoals Co., the value of which may be dependent upon the right to develop water power under this lease, and shall pay to the Muscle Shoals Co. a price which may have been previously agreed upon between the parties, or in the event of failure to so agree the Government shall pay for such property a fair value, to be determined by condemnation proceedings usual in the States wherein the property

1. The Government, furthermore, on taking possession shall assume the obligations of the Muscle Shoals Co. that have been predicated by the Muscle Shoals Co. to the Government for approval.

River in Alabama known as Cherokee Bluffs. Now, the Tallapoosa River, of course, is in a different watershed from the Tennessee River. The Cherokee Bluffs site and certain reservoir lands were acquired with the view of developing at the Cherokee Bluffs site a great storage project, and the efforts of those interested in both developments then was to create this storage development on the Tallapoosa River, to build dams on the Tennessee River, and to connect these two developments by transmission lines, the Tallapoosa River to supplement the development on the Tennessee River.

This Cherokee Bluffs reservoir site, if developed on this theory, would result in a storage reservoir of a capacity of approximately 50,000,000,000 cubic feet of water. That was the capacity, 50,000,000,000 cubic feet of water, a very large storage project.

There was a smaller project along lines of storage on what was known as the Little River in Alabama, capable of storing some approximately 5,000,000,000 cubic feet of water, and from time to time this Muscle Shoals situation was expanded to further include the storage which might be made at the Little River, but the principal theory or plan was to connect the Tallapoosa River and Tennessee River developments in this manner.

Now, this Birmingham, Montgomery & Gulf Power Co. was owned by more or less the same group of individuals who were interested in the Muscle Shoals Hydro Electric Power Co. in 1912, and Mr. James Mitchell and associates took over this Birmingham Co., along with the Muscle Shoals situation, with the view of its development along some line.

A great deal of work was done in the succeeding two years on a plan looking to the development of the Muscle Shoals power on the lines I have stated.

The CHAIRMAN. Excuse me just one moment. Did these two companies that you speak of become subsidiary companies to the Alabama Power Co.?

Mr. MARTIN. In effect, Mr. Chairman, that was true; yes.

There was a great deal of work done looking to the development of the Muscle Shoals situation in 1912 and 1913, and this work culminated in a proposal to the Government for the development of the sites 2 and 3 on the Tennessee River, that proposal being dated December 10, 1913, and supplemented by a letter of the Muscle Shoals Hydro Electric Power Co. of January 1, 1914.

Of course, we all understood that any developments on the Tennessee River, being a navigable stream, had to be authorized in due course by the Congress, and hence the whole plan of working this situation out necessarily involved a proposal to the Government.

The CHAIRMAN. And these propositions were all made to the Government before the war had even started in Europe?

Mr. MARTIN. Yes, sir. These proposals were made, as I have stated, in December, 1913, supplemented by a second letter of January 1, 1914, which I will ask leave to file in the record.

The CHAIRMAN. You may file them.

Mr. MARTIN. Now, that proposal was considered by the engineers of the United States for some months, and their consideration culminated in a report from the Chief of Engineers, Gen. Dan C. Kingman, to Hon. S. M. Sparkman, chairman of the Committee on Rivers and Harbors, House of Representatives, under date of May 18, 1914; and this report, together with our proposal, is set forth in Document No. 20, Sixty-third Congress, second session, a document printed for the use of the Committee on Rivers and Harbors, House of Representatives.

The CHAIRMAN. Who was at the head of the Corps of Engineers at that time?

Mr. MARTIN. Gen. Dan C. Kingman.

The CHAIRMAN. I remember almost all the Chiefs of Engineers since 1900, but I can not remember Gen. Kingman.

Mr. FIELDS. I remember him very well.

The CHAIRMAN. You say you remember him, Mr. Fields?

Mr. FIELDS. Yes, sir; he presided at a meeting of the engineers in my district on the question of the improvement of the Big Sandy River.

Mr. MARTIN. This plan, which was suggested in our proposal of coordinating these developments on the Tennessee River and the Tallapoosa River was approved and highly recommended, as you will see on an examination of these reports of the district engineer to the Chief of Engineers, and I would like to quote just a sentence, if I may take the liberty, from that report, and then I will pass on to the comment I wish to make.

In Gen. Kingman's letter he stated:

"The Board of Engineers for Rivers and Harbors has carefully considered this plan and is in general accord with the views and recommendations of the special board, though believing that a due regard of public interest requires that some equitable provision should be made whereby the United States may terminate the lease at any time after the end of 50 years in case it should become apparent that such action is desirable."

I just wanted to read that comment in passing, and then there is a further comment upon the proposal.

The proposal report and letters referred to follow:

[Rivers and Harbors Document No. 20. Sixty-third Congress, second session.]

TENNESSEE RIVER BETWEEN BROWNS ISLAND AND THE RAILROAD BRIDGE BELOW THE CITY OF FLORENCE, ALA. (MUSCLE SHOALS).

REPORT OF THE BOARD OF ENGINEERS FOR RIVERS AND HARBORS ON TENNESSEE RIVER BETWEEN BROWNS ISLAND AND THE RAILROAD BRIDGE BELOW THE CITY OF FLORENCE, ALA.

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS,
Washington, May 18, 1914.

SIR: Referring to your letter dated March 2, 1912, inclosing a copy of a resolution dated February 24, 1912, by the Committee on Rivers and Harbors of the House of Representatives, requesting the Board of Engineers for Rivers and Harbors to review all previous reports on survey of the Tennessee River in the State of Alabama from Browns Island to the railroad bridge below the city of Florence, Ala., and to submit certain additional information and estimates relative to the coordination of proposed improvements for navigation and water power at this locality, with a view to providing for an immediate slack-water navigation of 6 feet, capable of later deepening to 9 feet, I have the honor to inclose herewith a copy of the report of the board, dated May 5, 1914, in response thereto, together with a copy of a report dated February 23, 1914, by a special board of engineers created for the purpose of making the necessary local investigations.

2. Bids were invited by the special board for cooperation by water-power interests in the proposed development. Two bids were received, that of the Muscle Shoals Hydro-Electric Power Co., being deemed the more advantageous to the United States. The cost of providing 6-foot navigation, under a plan contemplating a water-power development, satisfactory to this company is estimated by the special board at \$18,701,000. Of this approximately \$8,575,000 may properly represent the value of the proposed improvement to navigation, the remainder being chargeable to power development, and to be reimbursed to the United States with interest under a definite schedule of payments, the first to be a cash payment of \$3,000,000 upon the completion of the structures at site No. 2, to be followed by 99 annual cash payments in amounts which, with the first payment, will return the entire part of the cost chargeable to power development with compound interest at 3 per cent. In addition, the company proposes to pay each year an amount equivalent to 35 cents per horsepower of installed capacity, beginning as soon as this exceeds 200,000 horsepower, and in any case not later than 20 years after first power is developed. The lease period proposed is 100 years.

3. The Board of Engineers for Rivers and Harbors has carefully considered this plan and is in general accord with the views and recommendations of the special board, though believing that a due regard of public interests requires that some equitable provision should be made whereby the United States may terminate the lease at any time after the end of 50 years in case it should become apparent that such action is desirable. With this provision the board is of opinion that it is advisable for the United States to adopt the project outlined by the special board for combined navigation improvement and power development on the Tennessee River at Muscle Shoals, Ala., in cooperation with the Muscle Shoals Hydro-Electric Power Co., at a total estimated cost of \$18,701,000, under the conditions specified by the special board. The first appropriation should provide at least \$1,000,000 in cash and contract authorization for the balance, with a view to completion of the work in five years. In case Congress does not adopt the project at once, the board recommends an appropriation of \$150,000 to provide for completion of the detailed surveys,

MUSCLE SHOALS PROPOSITIONS.

... and preparation of plans, so that there need be no unnecessary interruption of the work whenever it is authorized.
... consideration of the above-mentioned reports, I concur with the ... Board and the Board of Engineers for Rivers and Harbors.
... particularly invited to the general comments made by the latter ... paragraph of its report relative to the economic questions ... financing of joint navigation and water-power developments, of ... size herein proposed is the first to be recommended on a very large ...

DAN C. KINGMAN,
Chief of Engineers, United States Army.

S. M. SPARKMAN,
*Chairman Committee on Rivers and Harbors,
House of Representatives.*

MUSCLE SHOALS HYDRO-ELECTRIC POWER CO., Nashville, Tenn., December 10, 1913.

Col. W. C. Langfitt and Members of the United States Engineer Board on the Improvement of the Muscle Shoals Section of the Tennessee River, United States Engineer Office, Nashville, Tenn.

SIR: The Muscle Shoals Hydro-Electric Power Co., with further engineering studies and investigations of the joint navigation-power improvement of the Muscle Shoals section of the Tennessee River, conducted during the past six months of extended time granted by your board, by your circular dated 25th of June, 1913, is now pleased and prepared to submit to your board the following suggestions and proposals:

Of the three methods named in your circular as acceptable to you for receiving bids, the Muscle Shoals Hydro-Electric Power Co. selects and proposed upon a combination of the two first methods.

The following bid of this company is based upon a lease of 100 years, and for the following reasons:

1. The Muscle Shoals Hydro-Electric Power Co., in the light of its own experience, feels that a project of this magnitude, involving such large financial negotiations, can not be financed on any successful basis with a period shorter than 100 years.

2. Hydroelectric, more than any other class of industrial investments, must bear a trying interest burden over a longer nonrevenue initial period of construction.

3. The hazards of a hydroelectric investment are greater than in any other class of investments.

4. In proportion as the lease period is shortened, in like proportion bond issues on such development are with greater difficulty and more expensively negotiated.

5. Electrochemical and electrometallurgical operations, upon which power developed at Muscle Shoals must rely for consumption, require and must secure power at extremely low rates covered by long-period contracts.

In the final preparation of this proposal the Muscle Shoals Co. has, at its expense, added to the earlier engineering investigations and reports covering a period of six years prior to your circular of June 25, 1913, further studies, surveys, soundings, and estimates, and transmits the result thereof to your board in the form of maps and drawings, tying in its work with the surveys of the Corps of Engineers, United States Army, wherever practicable. The result of the engineering studies and investigations by the Muscle Shoals Co. during the past six months has confirmed the conclusion suggested to your board on June 24, 1913, that the most feasible and economical plan for the joint improvement of navigation and development of power at Muscle Shoals is with two power dams instead of three, the lower dam being located on the site designated by your board as "No. 2" and the upper dam on the site designated by your board as "No. 4"; the lower dam site, No. 2, to have a crest elevation of 500, with the tail-water at 400.5 the upper dam, at site No. 4, to have an elevation of 540 for the top of the movable crest and 528 for the top of the fixed portion of the dam.

Our engineering studies and investigations, now running over six years, and especially the investigations we have made during the past six months, support the estimate which we have made that the cost of lands, dams, locks, power-

house substructures, and miscellaneous and engineering expenses, in connection with these items, together with a contingent and interest fund of \$1,000,000, will be \$17,349,100. Our plans are based on the gravity dam, sections, adopted by your board for Dams Nos. 2 and 4, and upon unit prices, which we believe, in the light of our recent experience, are more than ample, and which we hope and believe will commend themselves to you as safe.

The Muscle Shoals Hydroelectric Power Co. respectfully submits to your board the following proposals based upon the conditions therewith stated:

1. That the Government shall complete the dam at site No. 2 and the appurtenances thereto mentioned above and permanently raise the waters behind the said dam to the level of the spillway thereof within four years after the date of the first appropriation made for the carrying out of the project and not later than the 1st of January, 1919, and for a sufficiently long period of time prior to that date give entrance to the Muscle Shoals Co. for the completion by it, at its expense, of the power-house superstructures and the initial hydraulic and electrical equipment by that time.

That the Government shall complete the dam at Site No. 4 and the appurtenances thereby mentioned above and permanently raise the waters behind the said dam to the level of the spillway thereof within five years after the date of the first appropriation made for the carrying out of the project and not later than the 1st of January, 1920, and for a sufficiently long period of time prior to that date give entrance to the Muscle Shoals Co. for the completion by it, at its expense, of the power-house superstructures and the initial hydraulic and electrical equipment by that time.

2. The Muscle Shoals Co., upon the completion of the dam at Site No. 2 and the appurtenances mentioned above and the permanent raising of the waters behind said dam to the level of the spillway thereof, will pay to the Government the sum of \$3,000,000 in cash as its first contribution to the cost of the lands, docks, dams, and substructures.

3. The Muscle Shoals Co., within a period of 100 years from the completion of the dam at site No. 2 and appurtenances thereto mentioned above and the permanent raising of the waters behind the said dam to the level of the spillway thereof, will repay to the Government as its second contribution for lands, locks, dams, and substructures \$7,000,000, by an annual payment of sinking fund and interest, taken at the approximate rate of 3 per cent per annum and in specific amounts, to be paid as follows:

At the end of the first year after the completion of the dam at site No. 4 and the appurtenances thereto, mentioned above, and the permanent raising of the water behind said dam to the level of the spillway thereof.....

At the end of the first year after the completion of the dam at site No. 4 and the appurtenances thereto, mentioned above, and the permanent raising of the water behind said dam to the level of the spillway thereof.....	\$75,000
At the end of the second year.....	125,000
At the end of the third year.....	150,000
At the end of the fourth year.....	175,000
At the end of the fifth year.....	200,000
And each year thereafter to the close of the 100-year period.....	240,000

4. The Muscle Shoals Co., as its third contribution in aid of navigation, will pay to the Government each year an amount equivalent to 30 cents per horsepower of installed capacity measured on the switchboards of the power houses. Such payments shall begin at the end of the first year after the said installed capacity shall exceed 200,000 horsepower, but not later, in any event, than at the end of 20 years from the beginning of the said 100 year period, and shall continue to the end of the said period.

5. The Muscle Shoals Hydro-Electric Co., upon the invitation of the United States Government, at any reasonable time prior to the expiration of the said period of 100 years will undertake negotiations with the Government looking to a renewal of this lease. In the event of failure to agree upon terms, this lease shall terminate at the end of said period of 100 years, and the Government shall then take possession of all the property of the Muscle Shoals Co., the value of which may be dependent upon the right to develop water power under this lease, and shall pay to the Muscle Shoals Co. a price which may have been previously agreed upon between the parties, or in the event of failure to so agree the Government shall pay for such property a fair value, to be determined by condemnation proceedings usual in the States wherein the property is located. The Government, furthermore, on taking possession shall assume all the contract of obligations of the Muscle Shoals Co. that have been previously submitted by the Muscle Shoals Co. to the Government for approval.

foundation borings, and preparation of plans, so that there need be no unnecessary delay in active prosecution of the work whenever it is authorized.

4. After due consideration of the above-mentioned reports, I concur with the views of the special board and the Board of Engineers for Rivers and Harbors. Attention is particularly invited to the general comments made by the latter board in the final paragraph of its report relative to the economic questions involved in the financing of joint navigation and water-power developments, of which the one herein proposed is the first to be recommended on a very large scale.

DAN C. KINGMAN,

Chief of Engineers, United States Army.

HON. S. M. SPARKMAN,

Chairman Committee on Rivers and Harbors,

House of Representatives.

MUSCLE SHOALS HYDRO-ELECTRIC POWER CO.,

Nashville, Tenn., December 10, 1913.

Col. W. C. Langfitt and Members of the United States Engineer Board on the Improvement of the Muscle Shoals Section of the Tennessee River, United States Engineer Office, Nashville, Tenn.

SIR: The Muscle Shoals Hydro-Electric Power Co., with further engineering studies and investigations of the joint navigation-power improvement of the Muscle Shoals section of the Tennessee River, conducted during the past six months of extended time granted by your board, by your circular dated 25th of June, 1913, is now pleased and prepared to submit to your board the following suggestions and proposals:

Of the three methods named in your circular as acceptable to you for receiving bids, the Muscle Shoals Hydro-Electric Power Co. selects and proposed upon a combination of the two first methods.

The following bid of this company is based upon a lease of 100 years, and for the following reasons:

1. The Muscle Shoals Hydro-Electric Power Co., in the light of its own experience, feels that a project of this magnitude, involving such large financial negotiations, can not be financed on any successful basis with a period shorter than 100 years.

2. Hydroelectric, more than any other class of industrial investments, must bear a trying interest burden over a longer nonrevenue initial period of construction.

3. The hazards of a hydroelectric investment are greater than in any other class of investments.

4. In proportion as the lease period is shortened, in like proportion bond issues on such development are with greater difficulty and more expensively negotiated.

5. Electrochemical and electrometallurgical operations, upon which power developed at Muscle Shoals must rely for consumption, require and must secure power at extremely low rates covered by long-period contracts.

In the final preparation of this proposal the Muscle Shoals Co. has, at its expense, added to the earlier engineering investigations and reports covering a period of six years prior to your circular of June 25, 1913, further studies, surveys, soundings, and estimates, and transmits the result thereof to your board in the form of maps and drawings, tying in its work with the surveys of the Corps of Engineers, United States Army, wherever practicable. The result of the engineering studies and investigations by the Muscle Shoals Co. during the past six months has confirmed the conclusion suggested to your board on June 24, 1913, that the most feasible and economical plan for the joint improvement of navigation and development of power at Muscle Shoals is with two power dams instead of three, the lower dam being located on the site designated by your board as "No. 2" and the upper dam on the site designated by your board as "No. 4"; the lower dam site, No. 2, to have a crest elevation of 500, with the tail-water at 400.5 the upper dam, at site No. 4, to have an elevation of 540 for the top of the movable crest and 528 for the top of the fixed portion of the dam.

Our engineering studies and investigations, now running over six years, and especially the investigations we have made during the past six months, support the estimate which we have made that the cost of lands, dams, locks, power-

er would be utilized for a nitrate plant under 116 (Doc. No. 1262, 64th Cong., 1st sess., 1916).

matters in order that you may see that we were in working out a feasible plan for the development for general industrial use on lines of coordination. However, in 1918-19 this particular matter by the United States to supply power for a plant that the United States needed to go forward to make provision for nitrates, we concluded, as the representatives of the Government, to donate the site and other lands owned in fee by this company to the Government the question of any plan for future nitrates. This donation was made, and we received a check for the sum of \$1, being the nominal consideration. As you may recall, the donation was accepted by the Secretary of War, under date of February 19, 1919, and the thanks of the Government for the company's property. The property thus donated represented that by this company to the time of the donation we desired to be helpful to the Government in its donation in that spirit. From that time until we have taken no action with regard to the Muscle Shoals interest common to every patriotic citizen to the development of the Tennessee River Valley and the

a course contrary to the expressed purpose of the Muscle Shoals power shall be used in the manufacture of munitions for war and useful in the production of other useful products. Practically all of the electrical and mining operations in Alabama is furnished by the company, which we supply the lighting and other municipal needs of two-thirds of the State; and if, in the wisdom of the Government, Muscle Shoals should be reserved for nitrate purposes, we consider to be of greater benefit than the company, we will continue our program to develop the power to the extent the needs may require.

mention the following difficulties in the way of the development of the Muscle Shoals, which will be of substantial assistance to the company in its problem at Muscle Shoals.

National defense act of June 3, 1916, under which the development of the Muscle Shoals power plant are being constructed, contains the fol-

lowing provisions: "The power plants provided for under this act shall be constructed by the Government, and not in conjunction with any other project financed or operated on by private capital."

This is a serious legal question as to the authority of the Federal Power Commission, or other agencies of the Government, to proceed with the project without further legislation by Congress. The Government has provided, and the delay and uncertainty of action by Congress is an element in any proposal.

The company is not advised as to the extent to which the Government will contribute a portion of the investment as being due to war conditions. The Government may properly represent its power supply for the war, in addition to which it is assumed that a portion will be required for the development of navigation of the Tennessee River. These are conditions which, inasmuch as excessive costs would burden the entire development, increase the cost of power to consumers and to industrial enterprises which, with low power costs, should be a part of the Muscle Shoals power.

The power companies engaged in public service are in duty bound to find and develop sources of power at the lowest practicable cost to meet the rapidly increasing demands of the communities served. These demands are very moment most insistent. To fulfill its immediate responsibility the company has applied to the Federal Power Commission for a license to construct an important additional hydroelectric development on the Coosa River. While it is true that the power thus secured will be largely absorbed and new sources required by the time the Muscle

and which, within a reasonable time after such submission have not been disapproved of by the Government.

6. Repairs, maintenance, and operation of dams, power houses, substructures, superstructures, machinery, and appliances shall be at the expense of the Muscle Shoals Co. during the 100-year period. Repairs, maintenance, and operation of the locks shall be at the expense of the United States Government during the 100-year period.

7. The Muscle Shoals Co. will furnish the United States, free of charge, delivered to the lock grounds, electric power not to exceed 100 horsepower.

The board has asked that each bidder shall inclose with his proposal sufficient evidence to show what financial backing he may have in order to enable the board to give proper weight to his proposal. The financial interests which are the support of the Muscle Shoals Hydro-Electric Power Co. and the owners of its securities are engaged on a large scale in the development and operation of water powers in South America, Mexico, United States, and Canada and as large investors in industries requiring great amounts of hydroelectric energy. Their developments of this nature going forward at the present time involve an investment of about \$15,000,000. Representatives of the company will be pleased to state verbally to your board on presentation of this proposal such additional definite information as can not properly be conveyed in a document of more or less a public nature.

We believe it is proper and pertinent to call the attention of the board to what we conceive to be the three factors of exceptional strength involved in this company's proposal.

1. It is a plan by which, through the development of water power, the United States Government is repaid all of its expenditures for navigation and water-power development and becomes the sole possessor of all the things for which that expenditure was made.

2. It is a plan by which the normal high-water flow of the stream is conserved to an extent which makes feasible the development of two or three times as much power at Muscle Shoals as could otherwise be developed. This is possible only through combining with the Tennessee River development, subject each hour of the day to the vagaries of the flow of that stream, this company's proposed water-power developments on the Tallapoosa and Little Rivers with their extraordinary storage reservoirs. It is estimated that the maximum installed capacity practicable by these combined developments will be approximately 680,000 horsepower, while that practicable by the use of the waters of the Tennessee River at Muscle Shoals alone would be approximately 200,000 horsepower. Under this plan of combination the normal high-water flow of the Tennessee River at Muscle Shoals is conserved, which under any other plan of development would reduce the available developed power to dependence upon the low-water flow.

3. This plan contemplates the application of a material part of the power to be thus developed to the manufacture of an agricultural fertilizer through the fixation of atmospheric nitrogen, an industry in which there has been in four years of commercial life approximately \$60,000,000 invested and for the development of which the fundamental requirement is cheap continuous power and plenty of it.

If the joint navigation-power development at Muscle Shoals can be accomplished so that there will result a large volume of continuous cheap power, the manufacture of agricultural fertilizers through the fixation of atmospheric nitrogen should be possible on a scale adequate to afford the farmers of this great country advantages comparable to those enjoyed by European farmers.

If the board feels possibly that the Muscle Shoals Hydro-Electric Power Co. has in its proposal gone beyond the limitations of the resolution passed by Congress, under which the board is working, we rest our excuse. If any be needed, upon purpose No. 2 of the joint resolution passed by Congress authorizing the creation of your board by the War Department.

Respectfully submitted.

MUSCLE SHOALS HYDRO-ELECTRIC POWER CO.
J. W. WORTHINGTON, *President.*

MUSCLE SHOALS HYDROELECTRIC POWER CO.,
Nashville, Tenn., January 1, 1914.

Col. W. C. LANGFITT,
Nashville, Tenn.

SIR: This communication is proposed to your board as an addendum to the proposal made to your board by the Muscle Shoals Hydroelectric Power Co. under date of December 10 relative to cooperation between the United States Government and the Muscle Shoals Hydroelectric Power Co. for the joint navigation-power improvement of the Muscle Shoals section of the Tennessee River.

The estimates submitted by the Muscle Shoals Hydroelectric Power Co. accompanying its proposal of December 10 did not include, and we did not intend our proposal to include, the cost of the navigation dam designated by your board as Dam No. 1, with location just above the Florence Bridge, estimated to cost approximately \$1,000,000.

In submitting this amendment to our proposal of December 10 the Muscle Shoals Hydroelectric Power Co. proposes as follows:

1. That if Dam No. 1 may be used in a dual capacity, chiefly and necessarily for navigation, and contingently establish a regulation pool below the navigation and power dam at site No. 2, the Muscle Shoals Hydroelectric Power Co. may have the right to use such regulating pool.

2. In consideration of the use of the pool to be formed behind Dam No. 1, the Muscle Shoals Hydroelectric Power Co., as its third contribution in aid of navigation, will pay to the Government each year an amount equivalent to 35 cents per horsepower of installed capacity measured on the switchboards of the power houses, instead of 30 cents per horsepower as provided in our original proposal of December 10.

3. The Muscle Shoals Hydroelectric Power Co. will furnish to the United States free of charge, delivered to the lock grounds of Dam No. 1, electric power not to exceed 50 horsepower for the operation of the navigation facilities at Dam No. 1. All repairs, maintenance, and operation of Dam No. 1 and the lock appurtenant thereto shall be at the expense of the United States Government.

In all other respects this addendum to our proposal of December 10 shall subscribe to all of the conditions set forth in that proposal.

Respectfully submitted,

MUSCLE SHOALS HYDROELECTRIC POWER CO.,
J. W. WORTHINGTON, *President*.

No action was taken upon that proposal and further consideration was given by the engineers to a plan of development of this situation, and that plan of development was again reported in a Document No. 1262, Sixty-fourth Congress, first session, a letter from the Secretary of War to the House of Representatives transmitting, with a letter from the Chief of Engineers, reports on preliminary examination and survey of the Tennessee River between Browns Island and the railroad bridge below the city of Florence. I will file this report of the Secretary of War and the Chief of Engineers with the reporter.

The CHAIRMAN. Do you wish to file it with the hearings?

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Very well.

Mr. MARTIN. In this report there was again expressed by the Chief of Engineers approval of the proposed plan for the development of this project in coordination with a storage reservoir on the Tallapoosa River, and it was stated by the engineers that this was the most feasible plan for this development, and that the public interest was such that such a plan of development should be made, as in no other way could the true economic value of this power development be realized.

In the course of the report upon this subject, which I am filing, is this statement:

"It does not seem reasonable that such great benefits should be lost for the fear of possible evils to result from large power combinations. There is no doubt that either the United States Government or the State governments should control such combinations of power for the purpose of regulating rates to consumers, but combinations that produce enormous savings of energy which would otherwise be wasted ought to be encouraged rather than forbidden. True conservation requires the utilization without waste of all natural re-

sources, and here, at Muscle Shoals, there will be enormous wastage if this run-of-the-river power can not be combined with plants having facilities for storing great quantities of water to make up for the shortage at Muscle Shoals during times of low water."

This report was concurred in by Gen. Lansing H. Beach, then division engineer in charge of this section of the country, including the Muscle Shoals.

In this letter from the Secretary of War, to which I have last referred, there was contained the recommendation that this plan of development should be undertaken, but in the meanwhile there had been passed section 124 of the national defense act, which had to do with providing a nitrate supply, and the suggestion was made that possibly one of these sites might be selected by the United States Government for a development in connection with the nitrate project, and hence action on this proposal was suspended pending any action Congress or the executive branches of the Government might see fit to take. Thus the matter rested with that proposal, in so far as the Muscle Shoals Hydroelectric Power Co. was concerned.

(The report and letter referred to follow:)

[House of Representatives. Document No. 1262. Sixty-fourth Congress, first session.]

TENNESSEE RIVER BETWEEN BROWNS ISLAND AND FLORENCE, ALA.

WAR DEPARTMENT.

Washington, June 28, 1916.

The SPEAKER OF THE HOUSE OF REPRESENTATIVES.

SIR: I have the honor to transmit herewith a letter from the Chief of Engineers, United States Army, dated 26th instant, together with copies of reports from Maj. H. Burgess, Corps of Engineers, dated April 5, 1915, and March 22, 1916, with maps, on preliminary examination and survey, respectively, of Tennessee River between Browns Island and the railroad bridge below the city of Florence, Ala., made by him in compliance with the provisions of the river and harbor act approved March 4, 1915.

Very respectfully,

NEWTON D. BAKER, *Secretary of War.*

WAR DEPARTMENT.

OFFICE OF THE CHIEF OF ENGINEERS.

Washington, June 26, 1916.

From: The Chief of Engineers, United States Army.

To: The Secretary of War.

Subject: Preliminary examination and survey of Tennessee River between Browns Island and the city of Florence, Ala.

1. There are submitted herewith, for transmission to Congress, reports dated April 5, 1915, and March 22, 1916, with maps, by Maj. H. Burgess, Corps of Engineers, on preliminary examination and survey, respectively, authorized by the river and harbor act approved March 4, 1915, of "Tennessee River, between Browns Island and the railroad bridge below the city of Florence."

2. The part of the river covered by these reports is generally known as the "Muscle Shoals" section. The improvement of this section by the United States in cooperation with water-power interests has been under consideration for some years and an exhaustive report published as Committee Document No. 20, Sixty-third Congress, second session, contains favorable recommendations for such an improvement at an estimated cost of \$18,701,000, of which approximately \$8,575,000 was considered as representing the value of the improvement to navigation, the remainder being chargeable to power development and to be reimbursed to the United States. The information then available was considered sufficient for a general estimate of cost and a determination of the advisability of the United States adopting the project, but was not sufficient for the final selection of sites and the making of detailed estimates of cost. As a result of the present survey, the district officer suggests a few minor changes in the plans, the most important being the selection of a new site for Lock and Dam No. 2. The estimate of cost is increased from \$18,701,000 to \$19,000,000. He also submits an alternative plan which would permit the development of about 82 per cent of the power that would be available under the first proposition. This plan is estimated to cost \$16,000,000, but is not favored

by any other combination of plants, and which can be secured under fair and reasonable terms, ought to be adopted, rather than to have this power continue to be wasted for many years and to have through navigation remain obstructed by these shoals, on the ground that delay may result in securing somewhat better terms from some other power company proposing to cooperate."

Mr. MARTIN. As I have stated on another occasion before this committee, in 1918 we were notified that this site No. 2 had been selected by the President for development in connection with a nitrate supply. We were asked to donate this site and we did donate the site No. 2 to the Government. I have at a previous hearing placed in the record a letter from our company, under date of February, 1918, addressed to Col. Charles Keller, of the Corps of Engineers, making the offer of donation and the reply of the Secretary of War accepting it.

Now, the next situation that developed was this: In April, 1921, the Chief of Engineers, sent out his letter to many of those interested, and others not interested, inviting suggestions in regard to the Wilson Dam project, as it then stood.

The CHAIRMAN. Did it confine itself simply to inviting suggestions or did it ask the tender of bids.

Mr. MARTIN. I will be glad to file the letter of the Chief of Engineers.

The CHAIRMAN. Very well.

Mr. MARTIN. The letter received by the Alabama Power Co. is as follows:

WAR DEPARTMENT,
OFFICE OF CHIEF OF ENGINEERS,
Washington, April 2, 1921.

ALABAMA POWER CO.,
Birmingham, Ala.

GENTLEMEN: 1. The Secretary of War has directed me to ascertain what arrangements can be made to derive a reasonable return upon the investment if the United States completes the dam and hydraulic power plant at Muscle Shoals, Tennessee River.

2. If you are interested I would be pleased to discuss the matter with you at this office at the earliest date that may be mutually determined.

3. It is desired to develop the matter and come to a conclusion at as early a date as possible.

Very truly, yours.

LANSING H. BEACH,
Major General, Chief of Engineers.

Now, the question of what arrangements might be made to derive a reasonable return upon the investment, if the United States completed the dam and hydraulic plant presented, of course, a very big question to all of us, and our company was interested, naturally, in the question because of its long connection with this whole situation.

We replied to that letter under date of May 28, 1921. Our letter has been introduced, but not certain exhibits which were attached, and I will take the liberty of handing to the reporter, if the chairman permits, the letter with the exhibits, to be incorporated in the record.

The CHAIRMAN. Were the exhibits presented to be put into the hearings?

Mr. MARTIN. They were not put in the record by the one who offered the letter. The exhibits were not attached, and I would like to have them in the record.

The CHAIRMAN. Very well, if they are a part of the letter.

Mr. MARTIN. Yes; they are a part of the letter and are referred to therein, and in order to get the letter entirely before the committee it might be better to introduce the whole letter at this point. In this letter our company reviewed the situation with regard to the Tennessee River and the Tallapoosa River situations to which I have referred, and in the course of the third paragraph of our letter made this statement with regard to our previous proposal:

"Believing that this was an economical and profitable undertaking, we were prepared under the conditions then existing to proceed with our share of this undertaking, and if this recommendation had been favorably acted upon the project would have been available for the manufacture of nitrates during the war period and many millions of dollars would have been saved."

We further invited attention to that provision of section 124 of the national defense act which provides that these plants should be constructed or operated solely by the Government; and hence there was no authority in law to deal with the subject at that time, nor any indication as to what extent the Con-

gress would authorize a part of this power supply to be devoted to commercial or industrial uses; but we did state that if those conditions and difficulties were cleared up, that our company was of the opinion that the development could go forward and be completed with the view of the sale and distribution of a sufficient volume of power therefrom by this company and others engaged in the public service in the territory adjacent to the development to enable the United States to derive a reasonable return upon that part of the project and the investment which might be allocated to the power feature of the project, and that we were prepared to cooperate in any manner desired by the United States in working out the project.

(The letter and exhibits referred to above are as follows:)

ALABAMA POWER CO.,
Birmingham, Ala., May 28, 1921.

Maj. Gen. LANSING H. BEACH,
Chief of Engineers, Washington, D. C.

DEAR SIR: We duly received your communication of April 2, 1921, inquiring what arrangements can be made to derive a reasonable return upon the investment if the Government completes the dam and hydraulic power plant at Muscle Shoals, Tennessee River, and you invite a discussion of the matter if we are interested.

We have given the subject of your letter careful consideration since its receipt and wish to make a reply as follows:

1. The site at which the dam is being constructed on the Tennessee River was purchased by our company in 1906, and from that time until 1918, a period of 12 years, we expended large sums of money in making studies, exploring foundations, and in the purchase of reservoir lands, with the view of its development as an integral part of the hydroelectric system which would be required to meet the needs of the communities which the company proposed to serve from time to time. It was our plan to construct storage reservoirs and to connect them with the proposed Muscle Shoals development to make up the deficiency in power at the latter place during seasons of low water. This fact alone would have enabled this company to plan for an ultimate installation at Muscle Shoals largely in excess of the installation that should be made as an independent, separate development. In short, our plans were adapted to fully conserve and utilize in the public interest the navigation and water resources of the region.

2. In the meanwhile we acquired other power sites in Alabama, and under an act of Congress of 1907, constructed a dam and power plant on the Coosa River, a smaller hydro plant on a nonnavigable stream, and several steam plants at different points on our system, with a total capacity of 177,400 horsepower (not including the Government steam plant at Warrior). This system embraces about 1,500 miles of high tension lines over which we are distributing energy to the public in more than two-thirds of Alabama, including one of the greatest industrial and mining districts in the country.

3. During the same period the engineers of the United States were investigating the project pursuant to the direction of Congress. A special board of engineers was created for the purpose of obtaining information and estimates relative to the cooperation of proposed improvements for navigation and water power, and that board invited bids for cooperation by water power interests in the proposed development. This company, through its subsidiary, Muscle Shoals Hydroelectric Power Co., submitted a plan in response to that invitation of the United States Engineers. Plans were also submitted by others, but upon careful investigation the special board recommended that Congress undertake the improvement in cooperation with this company, and that recommendation was concurred in by the Board of Engineers for Rivers and Harbors and by the Chief of Engineers. Believing that this was an economical and profitable undertaking, we were prepared under the conditions then existing to proceed with our share of this undertaking, and if this recommendation had been favorably acted upon the project would have been available for the manufacture of nitrates during the war period, and many millions of dollars would have been saved.

4. A further examination and survey of the project was made by the engineers of the United States in compliance with the provisions of the rivers and harbors act approved March 4, 1915. Recommendation was again made that the improvements be undertaken in cooperation with this company, but the engineers further recommended that action be suspended until it should be determined

whether the Muscle Shoals power would be utilized for a nitrate plant under the act of Congress of June 3, 1916 (Doc. No. 1262, 64th Cong., 1st sess., 1916).

5. We are advertising to these matters in order that you may see that we were for a number of years interested in working out a feasible plan for the development of the Muscle Shoals power for general industrial use on lines of coordination with improvements for navigation. However, in 1918-19 this particular site was selected for development by the United States to supply power for a nitrate plant; and as it seemed that the United States needed to go forward quickly in its war program to make provision for nitrates, we concluded, as the result of various conferences with representatives of the Government, to donate to the United States the dam site and other lands owned in fee by this company, leaving entirely to the Government the question of any plan for future cooperation with the United States. This donation was made, and we received from the United States its voucher for the sum of \$1, being the nominal consideration expressed in the deed. As you may recall, the donation was accepted in behalf of the United States by the Secretary of War, under date of February 20, 1918, who expressed the thanks of the Government for the company's action in so donating the property. The property thus donated represented on our books a total investment by this company to the time of the donation of approximately \$476,000, but we desired to be helpful to the Government in its war program and made the donation in that spirit. From that time until the receipt of your letter we have taken no action with regard to the Muscle Shoals project other than the interest common to every patriotic citizen to encourage the progress and development of the Tennessee River Valley and the contiguous country.

6. We do not wish to suggest a course contrary to the expressed purpose of Congress that all of the Muscle Shoals power shall be used in the manufacture of nitrates or other products needed for munitions of war and useful in the manufacture of fertilizer and other useful products. Practically all of the electrical power used in industrial and mining operations in Alabama is furnished by this company, in addition to which we supply the lighting and other municipal requirements to more than two-thirds of the State; and if, in the wisdom of Congress, all of the power at Muscle Shoals should be reserved for nitrate purposes, or applied to any other use considered to be of greater benefit than the public service rendered by the company, we will continue our program to develop other water power as the public needs may require.

7. We therefore wish to mention the following difficulties in the way of making any suggestion at this time which will be of substantial assistance to the Government in dealing with its problem at Muscle Shoals.

(a) Section 124 of the national defense act of June 3, 1916, under which the Muscle Shoals dam and power plant are being constructed, contains the following clause:

"* * * The plant or plants provided for under this act shall be constructed and operated solely by the Government, and not in conjunction with any other industry or enterprise carried on by private capital * * *"

This, of course, presents a serious legal question as to the authority of the Secretary of War, the Federal Power Commission, or other agencies of the Government to deal with the project without further legislation by Congress. In addition, funds must be provided, and the delay and uncertainty of action by Congress is a very serious element in any proposal.

(b) This company is not advised as to the extent to which the Government is disposed to consider a portion of the investment as being due to war emergency; or what portion may properly represent its power supply for nitrate purposes, in addition to which it is assumed that a portion will be charged to the improvement of navigation of the Tennessee River. These are vital considerations, inasmuch as excessive costs would burden the entire future of the power development, increase the cost of power to consumers and tend to discourage industrial enterprises which, with low power costs, should supply a market for a part of the Muscle Shoals power.

(c) This and other power companies engaged in public service are in duty bound promptly to find and develop sources of power at the lowest practicable cost to supply the rapidly increasing demands of the communities served. These demands are at this very moment most insistent. To fulfill its immediate requirements this company has applied to the Federal Power Commission for a license and is about to construct an important additional hydroelectric development on the Coosa River. While it is true that the power thus secured will be completely absorbed and new sources required by the time the Muscle

Shoals dam could be completed, yet the difficulties above mentioned and the doubt which arises from the apparent reluctance of Congress to sanction an agreement of cooperation, as shown by clause of the act of 1916 above quoted, suggest that this company would scarcely be justified in depending upon Muscle Shoals to take care of even more remote demands which are certain to arise and which must be prepared for well in advance.

8. If the above difficulties and uncertainties can in any manner be cleared up, and excessive costs avoided by fair charges to war emergency, power for nitrate purposes, and improved navigation, this company is of the opinion that the development can go forward and be completed with the view of the sale and distribution of a sufficient volume of power therefrom by this company and other companies engaged in public service in the territory adjacent to this development to enable the United States to derive a reasonable return upon such part of the investment as may be properly allocated to the power feature of the project.

9. Our company, together with adjacent power companies, possesses the necessary organization for the distribution of the power to the public, and while the principal markets in the South are now served by these companies, their transmission systems would have to be supplemented by new lines and other equipment to market this power. The power systems in the Southeastern States are now interconnected and the advantage to the public of such interconnection was the subject of a careful survey by eminent engineers acting under your direction and the subject is thoroughly discussed in a report prepared in the office of the Chief of Engineers by Col. Charles Keller and now printed as an official document entitled, "The Power Situation During the War."

We are inclosing with this letter further excerpts from that report which discuss at length the Muscle Shoals development.

10. It will require much consideration and study to enable us to present any definite commitment, and would, furthermore, require a more definite statement as to when the power would be available and as to just what portion of the cost would be accepted as the investment in the power project; these being elements which you will appreciate are vital in determining a course in the matter so far as our ability is concerned to take the power at a price affording the United States a reasonable return.

We may add, however, that during our connection with the project, as shown by our formal proposals in response to the Government's invitation (Docs. Nos. 20 and 1262), we regarded the construction of a power dam (at reasonable costs and on commercial plans) at this locality as both a practicable and profitable undertaking; and if there is a possibility that the Government will wish to have any part of the power used in a practical way for commercial purposes, then we would like to urge now that some disposition of the matter be made as early as possible, as you can appreciate that in its present status it is a disturbing feature in the industrial situation in this section.

If, therefore, authority is conferred by Congress to conclude a contract for the use of any part of the power by power companies, we wish to assure you that we are ready to work out a mutually satisfactory arrangement looking to the completion of the dam and the disposal of such part of the power as Congress wishes to place in commercial use; desiring now, as at all times in the past, to cooperate in every way desired by the United States in working out the matter.

Yours, very truly,

ALABAMA POWER CO.,
By THOR. W. MARTIN, *President*.

APPENDIX.

EXCERPTS FROM THE REPORT PREPARED IN THE OFFICE OF THE CHIEF OF ENGINEERS,
ENTITLED "THE POWER SITUATION DURING THE WAR."

The following is from Appendix E, entitled "Electric-Power Problems in the Southern States," pages 237-238 of that report.

The great advantages of interconnection and joint operation of power systems, and the economies in the building for increase in operating capacity, as herein stated, apply equally to a combination of the privately owned companies with the Government powers now building at Muscle Shoals. The characteristics of this Government power and the gain, both to the Government power and to the privately owned powers that would result from intercon-

nection and exchange of facilities, was an important consideration in the recommendation of the Tallapoosa River project, inasmuch as the interstate combination, with other power substituted for Tallapoosa, might be quite favorable as the Tallapoosa powers is a combination without Muscle Shoals.

"21. Under the present laws the Government Muscle Shoals hydro power now building can not be connected to or operated in conjunction with private interests. * * *

"25. The proposed interstate power system above described, including the proposed Tallapoosa River developments, and capable, as stated, of producing 2,100,000,000 kilowatt hours of prime power annually, if combined and operated in conjunction with a hydro plant at Muscle Shoals with 300,000 kilowatts ultimate installed capacity as proposed, would be capable of producing, in years of normal river flow, 2,880,000,000 kilowatt hours annually of prime hydro power without any steam generation."

The following is also from Appendix E, entitled "Electric power problems in the Southern States," pages 264 to 267, inclusive, of the report entitled "The power situation during the war":

"PART 5.

"GOVERNMENT HYDROELECTRIC DEVELOPMENT AT MUSCLE SHOALS, ALA.— RECOMMENDATIONS FOR ITS UTILIZATION.

"140. The proposed hydro development at Muscle Shoals authorized by the Government and now being built under the direction of the Chief of Engineers, United States Army, provides for a high dam in the Tennessee River and the installation of electric machinery for the generation of power. The river flow and other natural conditions at the site selected will permit the generation of 40,000 kilowatts during stages of low water to an extreme low year, and 300,000 kilowatts can be generated during five months in years of normal river flow.

"141. By act of Congress (39 Stat., 215) it is provided that 'the plant or plants provided for under this act shall be constructed and operated solely by the Government and not in conjunction with any other industry or enterprise carried on by private capital.' The terms of the act are such that it would be unlawful to interconnect this plant with central station power systems of the Southern States and use even a portion of this power for other than Government industries.

"142. This report on the power resources of the Southern States has been prepared to point out the most economic and reliable source of power that can be utilized for serving the industries of the South with a view to securing maximum economy in generation, and the resources in water and steam power thus far considered have excluded the Muscle Shoals project, by reason of the existing law prohibiting the use of this power for private purposes.

"143. The procedure is illogical and unreasonable, because in order to provide cheap power it is necessary that the best sources of power be used, whether they are hydroelectric development using the natural flow of the river, or whether they are hydroelectric powers with storage reservoirs that conserve the water during the high-water stages for use during low-water stages, or whether they are sources of steam power, and, further, it is necessary to operate these powers jointly to obtain maximum economy, reliability, and conservation of resources in fuel, labor, and materials.

"144. The best economy and reliability can not be secured by any one development, whether it is hydropower by flow of streams, or by storage, or steam power, but will be obtained by a suitable combination of these different sources and by the interconnection of the systems applied by them. Muscle Shoals has been selected by the Government as a favorable location to the production of cheap power. The proposed design will furnish 100,000 kilowatts of prime power and 200,000 kilowatts of second-class power in an average year. The steam plant of 60,000 kilowatts which the Government has installed at Muscle Shoals is capable of converting a portion of the second-class power to prime power. But this combination with a steam plant at Muscle Shoals, regardless of whatever economy may result, can not be, broadly speaking, as favorable for all interests, either the Government interests or private interests, as a combination of the Muscle Shoals steam and hydro powers with an interconnected group of public-utility systems as described in this report. To segregate the Muscle Shoals power facilities from the other systems of the country is contrary to the policy recommended and strongly advocated; that is, of interconnecting all of the efficient going power systems and jointly operating them for maximum

economy. The same principle which works for increased economy by interconnecting the public-utility power systems of the Southern States applies to a further interconnection, including the Muscle Shoals plants, and in the interest of cheap and reliable power the law should be changed and the interconnection and joint operation of all the developed power should be provided for.

"145. It is important that the law should be modified and the plants perfected at as early date for the joint operation of all southern electric utilities and the Muscle Shoals power, since the recommended future construction for the development of power facilities for the southern States must depend, in a large measure, on whether or not Muscle Shoals will be available for other than Government work. For instance, if Muscle Shoals power is to constitute an important source of the generating capacity of an interconnecting system for the southern States, the logical procedure for other developments by the public utility companies will be to build hydro plants with large storage reservoirs and steam plants, both of which will work economically in conjunction with the second-class power of Muscle Shoals, instead of developing additional flow of stream hydropower, which they might otherwise do if Muscle Shoals will not eventually be available for interconnection; and, on the other hand, if they develop flow of stream power, instead of storage hydro or steam power, the lack of assurance that Muscle Shoals will not be available in a few years, their own resources will not be of a nature to advantageously supplement Muscle Shoals and turn its second-class power into prime power should the Government policy later be changed. Even if a Government demand is built for the entire use of Muscle Shoals, the Government would be handicapped in having a large amount of second-class power, which is not so valuable as prime power, and for which it would not have the most effective source of conversion of second class to prime power.

"146. It is especially desirable that the interconnection to the combined southern power system be available for the purpose of distributing the Muscle Shoals power immediately upon its completion, and at least until its own market can be obtained, and that the developments for the next 5 to 10 years be directed toward the construction of such plants as will advantageously supplement Muscle Shoals. By this is meant by the time Muscle Shoals is completed it is perfectly practicable for the power systems of the southern States to acquire a connected load that will absorb a large part of the Muscle Shoals output and to have installed such plants of their own creation as will be useful to turn Muscle Shoals second-class power into prime power.

"147. It is argued that the Government steam plant can be used, when the hydro plant at Muscle Shoals is finished, to turn a large part of the second-class power into prime power. This is true; it can be used, but it is not the best plan available. There are large steam plants already built, and others will probably build before Muscle Shoals is completed, which, because of their more advantageous location for fuel, can make steam power more cheaply than the Government steam plant at Sheffield. Also, if the future load for Muscle Shoals is in a large part located at industrial centers in Alabama instead of in the Muscle Shoals-Sheffield district, the existing steam plants and prospective future steam plants will be more favorably located than the Muscle Shoals steam plants for joint operation with Muscle Shoals hydro power. This feature is important from the standpoint of reliability of service and transmission cost as well as in economy of generation. In fact, if Muscle Shoals is interconnected with the other southern power systems and generally operated with them for maximum economy, the steam plants in the industrial section of Alabama, and favorably located at the mines for cheap fuel, would be put into operation in case of low water before the Muscle Shoals steam plant would be started.

"148. If interconnection between Muscle Shoals and the big public utility power companies of the Southern States is not planned for in the near future and eventually carried out under favorable conditions, the Government development at Muscle Shoals is liable to result not in cheapening power for the industries of the South but rather in increasing the cost. It is a matter of common knowledge that one of the large private interests acquired the water-power site at Muscle Shoals and spent a large sum of money in preparation for a hydro development similar to the one now being built by the Government, with the intention of distributing this power to the industries of Alabama, which would logically later on, through interconnections, be extended to service in Georgia and Tennessee. The Government has come into the situation and taken over this source of power and is building the plant, as provided by law, exclusively for Government use; and if this is carried out it

will result in private industries being deprived of this natural resource, which, by reason of the Government's own action in neglecting this power for its use, may be regarded as a cheap source of power.

"149. We have no figures as to what the Government estimates the cost of Muscle Shoals power will be, either primary power or second-class power, since the undertaking at this place is for the joint purpose of improving navigation and for creating power, and we are not informed as to the proportionate charge that goes to these two purposes. It is, however, obvious that if a big power load is to be built up about Muscle Shoals it must be done either by direct Government operation or else the attraction in the way of low-priced power must be very marked to divert manufacturing from the present industrial centers and favorable location for raw materials and transportation to the district adjacent to Muscle Shoals, which is sparsely developed industrially. If the inducement in the way of cheap power is sufficient to overcome the natural conditions as established by the superior industrial progress in other sections, the power at Muscle Shoals must be available at a relatively low rate, which also, without modification of the present law, would have to be wholly for Government purposes.

"150. It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will supplement such other for economy of construction and operation."

I would like at this point to invite your attention, Mr. Chairman, to another report of the engineers of the United States dealing with this project in its uncompleted condition.

There was a report prepared in the office of the Chief of Engineers and transmitted to the Secretary of War in 1921, entitled "The Power Situation During the War" reviewing the activities of the Government touching various aspects of the power question which arose during the war, with comments upon the efforts made to coordinate power resources, to get power for the benefit of war industries, and containing suggestions for the coordination of power developments in every section of this country looking to the better utilization or greater utilization of all the power resources.

There is a large part of this report devoted to the Muscle Shoals situation. The gentlemen who made this report in behalf of the Government on this Muscle Shoals project—that is to say, the Dam No. 2 and the Dam No. 3, not then started—considered its relation to this proposed Tallapoosa development and again recommended in this report that the development should proceed along the lines of the previous reports of the Engineers of the United States.

I would like to just read a few lines from this report. There are a number of pages devoted to this very question which are extremely important and extremely interesting and we trust that you, Mr. Chairman, and the members of the committee will take the time to read what these gentlemen said in this report, so recently filed and printed in the year 1921.

The CHAIRMAN. Do you desire to offer the whole report for the hearings?

Mr. MARTIN. No, sir; but excerpts from this report were attached to our letter to the Chief of Engineers of May 28, 1921, and thus there will be in the record all those parts which have to do with this development.

This report proceeded upon the theory that this development should proceed, this power developed and this great power station interconnected with the power development in other watersheds in Alabama and other States. This is from page 237 of the report:

"The great advantages of interconnection and joint operation of power systems and the economies in the building for increase in generating capacity as herein stated apply equally to a combination of the privately owned companies with the Government's powers now building at Muscle Shoals. The characteristics of this Government power and the gain both to the Government power and to the privately owned powers that would result from interconnection and exchange of facilities was an important consideration in the recommendation of the Tallapoosa River project, inasmuch as the interstate combination, with other power substituted for Tallapoosa, might be quite as favorable as the Tallapoosa power in a combination without Muscle Shoals."

The CHAIRMAN. How many pages are there in that report?

Mr. MARTIN. This report involves about 300 pages.

The CHAIRMAN. Would you kindly refer to the report, so that it may be identified in the record?

Mr. MARTIN. It is entitled "The Power Situation During the War," by Col. Charles Keller, Corps of Engineers, War Department, Office of the Chief of Engineers, dated December 13, 1919, and is addressed to the honorable the Secretary of War, through the Chief of Engineers, United States Army, Washington, D. C.

The CHAIRMAN. The reason I wanted you to identify the report was that in case any Member wanted to look it over he would know just what document is referred to.

Mr. MARTIN. It is not described by a document number, but it is printed as a public document.

The CHAIRMAN. Do you wish to read any more from it?

Mr. MARTIN. I will not, except to say that in our proposal submitted a day or two ago to the Secretary of War we quoted section 150 of this report, as follows:

"It therefore appears that a broad and well-founded judgment would dictate that the Muscle Shoals development should be interconnected for exchange of power with the existing power systems of the Southern States, and that this interconnection and exchange should be arranged for without delay, so that future construction, both at Muscle Shoals and elsewhere, can be directed for the production of plants which will supplement each other for economy of construction and operation."

In substance that is the recommendation of that report.

Our attention was again invited to this question by Gen. Beach in a letter dated June 18, 1921, which I will hand the reporter to be made a part of my statement, as follows:

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ENGINEERS.
Washington, June 18, 1921.

Mr. T. W. MARTIN,
*President Alabama Power Co.,
Birmingham, Ala.*

DEAR SIR: I would like to inquire what power the Alabama Power Co. would desire or be willing to take from Muscle Shoals two years from this date, and also three years from this date, if one year's advance notice of actual date at which power could be delivered could be given and a satisfactory price is guaranteed.

Very truly, yours,

LANSING H. BEACH,
Major General, Chief of Engineers.

Now, we replied to that letter under date of the 14th of July, 1921, which I would also like to place in the record, in which we point out that at the time of this letter, July, 1921, we were engaged in the construction of a new hydro plant on the Coosa River in Alabama, under a 50-year license from the Federal Power Commission which would give us approximately 100,000 horsepower; that that development would be completed by the end of the year 1922, but that the power from this development would be absorbed immediately, and that further power would be needed in Alabama in our own situation, and that we would be impelled to go further with some further power development some time in the present year to meet the demands in the State of Alabama unless we could have some program arranged by which this Muscle Shoals power could be made available.

Now, I would like to make it very clear that the particular power development in progress in the year 1922 will supply only the market which exists to-day, which is supplied from steam power, and will be completely absorbed, practically, upon its completion. We stated to Gen. Beach that a study of the power markets in our territory convinced us that the demands for power would require further sources, which should be available by 1926 at the latest.

We are still in the position stated, and it is now quite clear that our anticipation or forecast of power requirements in the territory which is immediately served by the lines of our company and in the territory which is easily adjacent to this development are so large that there can be no doubt that this entire development would be absorbed promptly upon its completion.

(The letter above referred to follows:)

ALABAMA POWER CO.,
Birmingham, Ala., July 14, 1921.

MAJ. GEN. LANSING H. BEACH,
Chief of Engineers, United States Army, Washington, D. C.

DEAR SIR: We wish to acknowledge receipt of your letter of the 18th ultimo, inquiring what power this company would desire or be willing to take from Muscle Shoals two years from that date, and also three years from that date, if one year's advance notice of actual date power could be delivered could be given and a satisfactory price guaranteed.

We wrote you under date of May 28 last regarding certain aspects of this problem, to which we beg to refer in connection with our answer to your letter. As therein stated, we have insistent demands for power; that to fill its immediate requirements this company has applied to the Federal Power Commission for a license to construct an important additional hydroelectric development on the Coosa River, and added:

"While it is true that the power thus secured will be completely absorbed and new sources required by the time the Muscle Shoals Dam could be completed, yet the difficulties above mentioned and the doubt which arises from the apparent reluctance of Congress to sanction an arrangement of cooperation, as shown by the clause of the act of 1916 above quoted, suggest that this company would scarcely be justified in depending upon Muscle Shoals to take care of even more remote demands which are certain to arise and which must be prepared for well in advance."

We concluded our letter in this language:

"If, therefore, authority is conferred by Congress to conclude a contract for the use of any part of the power by power companies, we wish to assure you that we are ready to work out a mutually satisfactory arrangement looking to the completion of the dam and the disposal of such part of the power as Congress wishes to place in commercial use, desiring now, as at all times in the past, to cooperate in every way desired by the United States in working out the matter."

Since that letter was forwarded to you the Federal Power Commission has issued to this company a license to construct the Coosa development. We are planning to install 60,000 horsepower and preliminary construction is now beginning. It is our purpose to prosecute the work with all diligence with the view of having power available therefrom in the spring of 1923. While the initial installation as now planned is 60,000 horsepower, the ultimate installation will be 120,000 horsepower. In going forward with this development we considered that we were in duty bound to proceed, because it did not seem at all possible that the Muscle Shoals hydro development could produce any power during 1923 or 1924. Our power demands are at present in excess of our water-power capacity, but the power which will result from the new Coosa development will fulfill our immediate requirements; i. e., will enable us in 1923 to greatly reduce our steam running and we will thus be enabled to meet the public demands during 1923 and for the most part in 1924 with the output of our hydro plants.

However, we wish to say that study of the power markets in the territory served by our company convinces us that the demands for power will require further sources which should be available during 1926 at the latest.

We must make our plans for several years in advance of actual power needs, and longer notice than one year in advance of actual date at which the Muscle Shoals power could be delivered would be necessary for this company to commit itself for the taking of definite amounts of power; and unless a commitment can be made not later than March, 1922, by the United States Government for the delivery of definite amounts of power, we will find it necessary to proceed with another hydro development in Alabama to meet our requirements. We will be glad meanwhile to discuss the subject with you in a definite way if desired.

Awaiting your further suggestions, we are,

Yours, very truly,

ALABAMA POWER CO.,
By THOMAS W. MARTIN,
President.

During the year 1921 financial conditions which would enable a company such as ours to finance the Wilson Dam to completion were not satisfactory, and it is only resulting from the financial conditions of very recent weeks, or the last two months, that have made it practicable for a company engaged in such service as our company to make a proposal that will undertake the financing of this project.

The financial conditions have improved, have substantially improved, in so far as concerns the sale of long-term securities, within the past 60 or 90 days or four months, and the conditions are such that we are prepared to, and can, go forward with a program such as we have outlined in our proposal.

I would like to say just a word or two on the question of the power market which exists for the power from this development.

The present power and lighting load which is carried on the system of the Alabama Power Co. is approximately 135,000 horsepower. We have established what we call the maximum peak load of our system, which is as high as 100,000 horsepower; that is, we have carried at recent times, within recent months, 100,000 horsepower for short periods. With a return to normal business during the present year, and having regard to applications for service which have been made to our company, the service within our own State will increase our power load to a definite, day-to-day program of 160,000 horsepower.

As we go along in the power business we find there is a certain natural growth of load due to the increased demand of existing customers.

There are also new industries normally coming into a system such as ours, which we assume to be, from our experience, approximately 10 per cent per annum.

That will carry us by the 1st of January, 1926, we will say, just on the system we have to-day without any extension of the system at all, to 210,000 horsepower.

In addition to that there is service very near our line, exclusive of railway electrification, of 160,000 horsepower, which is now served from isolated plants or plants which would be discontinued and which would be very glad to have central station service if and when available.

Now, that is within the State of Alabama alone. We have made investigations into various sections of the South. Inquiries have been made to us from various sections of the South.

I would like to take the liberty of calling the attention of the committee now to a map which we have prepared, as probably you can see from there, Mr. Chairman. With Muscle Shoals as a center, there are lines drawn at intervals of 50 and 100 miles—the light lines are 50 miles from Muscle Shoals and the heavier dark lines are 100 miles. In a radius of 150 miles, we will say, there is Memphis, which has no hydro service, of course; Jackson, Tenn., which has none; Nashville, Tenn., has hydro service, but should have additional service; Columbia, Tenn., the same; and you will also see Meridian, Miss., and in the next line you will see, 150 miles away, Little Rock and Vicksburg. You will see that Jackson is within 200 miles. I was mistaken about Little Rock and Vicksburg. They are within a radius of 200 miles. Going farther, we have at 300 miles Natchez, Mobile, and at a farther distance of slightly over 350 miles New Orleans, Baton Rouge, Pensacola, and at 400 miles the city of Shreveport.

We have for a long time been asked to consider the extension of transmission lines from power developments in Alabama to New Orleans, to Mobile, to Pensacola, to Little Rock, to Memphis, to Meridian, and in fact to all the towns and cities that you see in that circle, and you will notice that Paducah is within easy transmission distance of this Muscle Shoals development.

I would also like to mention, Mr. Chairman, that whereas this circle shows a 400-mile radius from Muscle Shoals, when you come to actually transmit power to places such as Mobile, Pensacola, and New Orleans, the logical program would be to develop powers in or near Montgomery, Ala., or northeast of Montgomery, in the rivers in that section, running transmission lines from there down to New Orleans, transmitting the power that is generated in that district southeast, and Muscle Shoals, of course, supplementing the whole situation. But there can be no development and no transmission of power to meet anywhere near the approximate needs of the communities southwest and south unless the Muscle Shoals development is made available in this whole situation.

It is, of course, the largest water power in the South, and without it the developments which exist in this immediate territory are not sufficient to supply these markets in the States of Mississippi and Louisiana, and even as far away as Memphis.

It is interesting, as, of course, you gentlemen know, that when we reach the end of the Appalachian chain in the State of Alabama there is no water power after you pass Alabama until you get beyond the Mississippi River, hundreds of miles away. That whole development of water power in Alabama, then, is the last and the last opportunity the public will have south and southwest to

obtain hydro power. If withdrawn from the public service, there is no opportunity for them ever to obtain hydro power. It is possible, but only possible, that even the city of Memphis may obtain hydro power if Muscle Shoals is withdrawn. If that entire development, as has been announced by others on this board, is devoted purely to local development, then there is no chance for Memphis to obtain hydro power except by excessively long transmission lines through the State of Tennessee from developments hundreds of miles away, which is a doubtful problem.

These markets to which I have referred and which are within transmission distance of these developments have a total power load to-day of approximately 200,000 horsepower.

In addition to that, the existing companies in the States of Tennessee and Georgia might be very substantially supplemented from this development, which we estimate at 70,000 horsepower.

Railway electrification in Alabama and other southern States should require large volumes of power which we have estimated at 240,000 horsepower.

There is then a possible power load, inclusive of the present load on our system plus this prospective load by 1926, of 880,000 horsepower.

By January 1, 1926, without any further power developments, the Alabama Power Co. will simply have 190,000 horsepower, sufficient alone for the needs of the limited circles we are now serving in Alabama.

The result of this whole calculation, which I will put in detail in the record, is that if there is no effort to supply these natural market demands by January 1, 1926, there will be a shortage or a deficit of approximately 500,000 horsepower in the territory to which I have referred and which should be supplied logically from the Muscle Shoals development.

A large part of this Muscle Shoals power, undoubtedly, will in any case be consumed at the place of development. It is the natural thing to expect that that will be done. It is also natural to expect that a part of this power that is available or can be developed in Alabama will reach other sections of the South to which I have referred. I will hand to the reporter the detailed statement which I have used in my explanation of the power demands in this section.

(The statement referred to follows:)

General statement concerning power situation in Alabama and contiguous territory.

	Horsepower.
(1) The present power and lighting load of Alabama Power Co. can be considered as.....	135,000
(2) The maximum load established in December, 1921, due to urgent needs for power in Georgia and Carolina, was.....	160,000
(3) With a return to normal business conditions in coal, iron, and textile industries in 1922, the power and lighting load, exclusive of requirements in Georgia and Carolina, will be.....	160,000
(4) Assuming 10 per cent per annum as a measure of natural growth of load due to increased use by present customers, plus new industries that will be attracted into the State by low-priced power, the load in 1926 will be.....	210,000
(5) There is an available power load in territory adjacent to present transmission lines of Alabama Power Co., exclusive of railway electrification, of.....	160,000
(6) There is a power load available to Alabama Power Co. by extension of lines to Memphis, New Orleans, Mobile, Meridian, etc., of.....	200,000
(7) The Tennessee Power Co., the Georgia Railway & Power Co., the Columbus Power Co., the Central Georgia Power Co., in order to supplement existing plants, will absorb.....	70,000
(8) Railway electrification in Alabama alone offers a potential market for.....	240,000
(9) The total load in 1926, inclusive of present load plus prospective load, may reasonably be.....	880,000
(10) Alabama Power Co. present generating capacity.....	190,000
(11) Additional generating capacity from Muscle Shoals steam plant.....	80,000
(12) Additional generating capacity from Mitchell Dam.....	110,000
(13) Total generating capacity available under present program without Muscle Shoals in 1926 will be.....	330,000
(14) Deficit to be supplied by Muscle Shoals.....	500,000

plant, and in addition give the Government 100,000 secondary horsepower for its uses at these nitrate plants.

Now, the Alabama Power Co., of course, is a power-producing company. We manufacture and sell power. We are not in the fertilizer business. We feel we are creating here a very important and vital situation, one that the Government can take advantage of, having power with the nitrate plant, and an interest those who wish to manufacture nitrates.

Of course this does not settle the question of who shall manufacture nitrates. We have all been told that the art of producing nitrates by artificial methods is changing from time to time. Only last Sunday there was a very interesting technical article as to the present state of the art in Germany. The Haber process is advancing there rapidly. It may, and undoubtedly will, come to this country. There will doubtless be other processes come to this country. The result of this, it seems to us, will be, Mr. Chairman, with power available and with these plants, there will be opportunity for first one and then another, as the Secretary of War more or less suggests, to undertake the manufacture of fertilizer and to undertake the manufacture of nitrates by any process or methods that commercial or other conditions for the moment may make available.

We only wish to say that since this whole question has been under discussion we have been approached by those interested in the manufacture of nitrates by some other methods, indicating a desire to go forward with the manufacture of nitrates in some way at these plants; people who are not now engaged in the fertilizer business, people who have not appeared before you at all, and who have no connection with any of the companies or interests which have come into the situation. I can not speak, of course, in the sense that these gentlemen are ready to do business on a basis or on what basis; I can only say that in my judgment, if the Government of the United States has power and a plant, it will find people who are ready and willing to go forward and manufacture nitrates.

It has been suggested here by one gentleman that secondary power could not be used for this purpose. I wish to go into that for a little while, Mr. Chairman, although I do not undertake to speak as an expert.

One gentleman who has appeared in that connection is Mr. Bower and the other is Mr. Swann. Mr. Swann, who is the president of the Federal Phosphorus Co., took the definite position, you will recall, that secondary power could be used, and that in the course of his own development he planned to use secondary power because that was cheaper, naturally, and it would be of interest to the public to use secondary power because in that way they would get this fertilizer product cheaper.

The other gentleman was Mr. Bower. Mr. Bower took the view, as I understood, that this secondary power could not be used. Now, Mr. Chairman, I do not want to take issue with Mr. Bower, but I would like to hand to the reporter Mr. Bower's own statements on this subject before a subcommittee of the House Committee on Appropriations February 15, 1921, found in the hearings on the sundry civil appropriation bill for 1922, page 119 et seq.

The substance of that is this (Mr. Magee was asking the questions):

"Mr. MAGEE. Then, if you are going to use the secondary power, there would be certain seasons when you could not operate the plant?"

"Mr. BOWER. Yes; at certain seasons.

"Mr. MAGEE. And you would have to shut down and throw out of work 2,000 or 2,500 men?"

"Mr. BOWER. No; you would not shut down altogether and throw out 2,500 or account of the drop in horsepower, because your horsepower requirements at that plant are at the carbide furnaces.

"Mr. MAGEE. You would have to cut down the number of your men?"

"Mr. BOWER. Some of them, for a little while.

"Mr. MAGEE. What proportion would you cut down—50 per cent?"

"Mr. BOWER. Oh, no, sir. It would simply be the men employed around the carbide furnaces, which would be closed temporarily only.

"Mr. MAGEE. You would have to disorganize your organization.

"Mr. BOWER. My thought would be this: You figure your total labor cost on cyanamid over the year, and you would run 10 months of the year and have a certain amount of labor cost, and then for two months suppose they were idle. It would pay to keep those men. It might add 50 to 75 cents a ton to your cost, but that would be so much cheaper—"

"Mr. MAGEE. When you figure on using the secondary power, when you did not get that power, then you would not operate the plant?"

"Mr. BOWER. Not the total plant; absolutely not."

This colloquy continued over a long period, the theory of the hearing being that if the Government would undertake to complete the development the Government would be in position to sell 100,000 primary power to public utilities operating in this section, leaving the secondary power for the operation of this nitrate plant, and that was the plan or theory advanced in these hearings by these gentlemen who were then interested in this project. I will take the liberty of handing these excerpts to the reporter for insertion in the record.

As I have said, Mr. Swann, of the Federal Phosphorus Co., has taken the position that the secondary power should be used. As to whether it can be used is a matter for this committee to determine, in its own judgment, after hearing those who are capable of advising the committee. Of course, if more power is needed, it is always there and can be purchased.

(The excerpts from the statement of Mr. Bower referred to above follow:)

"PRIMARY AND SECONDARY HORSEPOWER.

"Mr. MAGEE. Unless you use the primary and secondary horsepowers for this same purpose, how are you going to keep your men employed?"

"Mr. BOWER. The power consumed in this plant is in the carbide furnace using the secondary power, but the whole 100,000 secondary power is not used—

"Mr. MAGEE (interposing). Unless you use the primary power you can not run the year round.

"Mr. BOWER. That is the point.

"Mr. MAGEE. Can you?"

"Mr. BOWER. No, sir; you can not run the total capacity of the plant.

"Mr. MAGEE. Then you would have to use steam?"

"Mr. BOWER. Let me come to that a little later. Then the second statement of cumulative evidence—

"The CHAIRMAN (interposing). You may proceed to make your statement. I realize that there have been interruptions, and we will try not to ask questions until you have finished.

"Mr. BOWER. I do not object to questions at all.

"The CHAIRMAN. I understand.

"Mr. BOWER. That is the second thing that comes to our attention—the cost submitted by the War Department. Next we have the report of the British ministry of munitions of war, nitrogen products committee, final report, issued after the war was over. I will not put in the record the names, but this was the character of the members of the committee [exhibiting]. I am referring to page 133 of the report, which says:

"In making the recommendation set out below the committee has been guided by the following salient facts, presumably developed by the previous study:

"(d) Of these salient facts, combined nitrogen (cyanamid or ammonium sulphate)—the two products proposed to be made at this plant—"can be obtained by synthetic processes at a cost at the factory which is less than half the market price of combined nitrogen from other sources, prewar conditions being taken as the basis in each case."

"As to this cumulative evidence from the third source—the British committee—the War Department has been appealed from, but I never have seen any figures that contradict the cost. Mr. Washburn himself, when he found that he was not going to get this plant for his own purposes, repudiated the statement made before the Committee on Agriculture of the House in the Senate Committee on Agriculture; he practically denied it.

"The CHAIRMAN. Permit me to interrupt you. The trouble about making a statement, where you are using all kinds of facts, and then waiting until you get through, is that what you have said has passed out of the minds of persons. I want to say that whether or not nitrogen can be manufactured in one country or another at a price that would permit its being used as fertilizer depends upon the cheapness of the power sold?

"Mr. BOWER. Surely.

"The CHAIRMAN. Take Norway, where the cost of power, as I recall, when you compute the investment in the plant, is a mere fraction of what it is going to cost at Muscle Shoals.

"Mr. BOWER. It is very low—not so much lower.

"The CHAIRMAN. When you bring in reports of that kind bearing upon power I can not myself bring my judgment to the conclusion that it is even cumulative—I do not believe that it has any bearing at all. You would first have to show me what a power plant that would produce 100,000 horsepower a year would cost, what the operation of it would cost, and then what you have read, it seems to me, would have some force.

"Mr. BOWER. We have Col. Cooper's estimate that the secondary power can sell for 1.2 mills.

"The CHAIRMAN. I understand in Norway the cost to produce hydroelectric power is from \$2 to \$12 per kilowatt year, whereas at Muscle Shoals it costs \$50 a kilowatt year. So the comparison you have given is one that it seems to me of itself falls of its own weight.

"Mr. BOWER. Mr. Good, the cost of 1.2 mills per kilowatt hour, as figured by Col. Cooper and submitted to your committee—I know it was submitted to the Senate committee at the hearing, and I presume that the same statement was made here—1.2 mills for the secondary power at Muscle Shoals figured on 100 per cent power factor, I think it is \$7.58 a horsepower year.

"Mr. MAGEE. I should like to get some idea of this if I can. Col. Cooper gave us a very clear statement of his position. If I understood him rightly, and I do not wish to make any statement which does not agree with the statement he gave, his position is this, that he is in favor of completing this project solely as a light and power proposition.

"Mr. BOWER. Yes, sir.

"Mr. MAGEE. He figured that it could cost so much to complete this project that it could be completed in from three to five years, and that at the end of 10 years more the Government could lease this plant for a light and power proposition without even distributing the power, but selling it at the plant?

"Mr. BOWER. Yes, sir.

"Mr. MAGEE. And get a rental of two and a half million dollars a year, or 5 per cent net on the amount of money which he estimated it would cost to complete this project. I would like to know if you concur in that view, or whether it is your idea the Government should complete this project solely as a fertilizer proposition.

"Mr. BOWER. No, sir; I do not claim so. Our thought is that with these possibilities, Mr. Magee, held out to us in the way of future production of fertilizer materials by the electric furnace—

"Mr. MAGEE (interposing). Then if you do not concur with him, as I understand, the statement shows that there can be produced here about 88,000 primary horsepower; is that right, Maj. Burns?

"Maj. BURNS. In round numbers Col. Cooper gave it as 100,000.

"Mr. MAGEE. Eighty-eight thousand, I think, is the amount stated in some hearing or approximately 100,000 primary horsepower. Do you propose in the fertilizer business to use this primary power?

"Mr. BOWER. No, sir; we would be ridiculous to come in and take power for \$28 or whatever that figures out, with power available at \$7.58.

"Mr. MAGEE. Then, if you are going to use the secondary power, there would be certain seasons when you could not operate the plant?

"Mr. BOWER. Yes; at certain seasons.

"Mr. MAGEE. And you would have to shut down and throw out of work 2,000 or 2,500 men?

"Mr. BOWER. No; you would not shut down altogether and throw out 2,500 on account of the drop in horsepower, because your horsepower requirements at that plant are at the carbide furnaces.

"Mr. MAGEE. You would have to cut down the number of your men?

"Mr. BOWER. Some of them, for a little while.

"Mr. MAGEE. What proportion would you cut down—50 per cent?

"Mr. BOWER. Oh, no, sir. It would simply be the men employed around the carbide furnaces, which would be closed temporarily only.

"Mr. MAGEE. You would have to disorganize your organization?

"Mr. BOWER. My thought would be this: You figure your total labor cost on cyanamid over the year, and you would run 10 months of the year and have a certain amount of labor cost, and then for two months they were idle. It would pay to keep those men. It might add 50 or 75 cents a ton to your cost, but that would be so much cheaper—

"Mr. MAGEE. When you figure on using the secondary power, when you did not get that power, then you would not operate the plant?

"Mr. BOWER. Not the total plant; absolutely not.

"The CHAIRMAN. Why, Mr. Bower, I am amazed that the farm bureaus are interested in building this plant to sell 100,000 primary horsepower to a British corporation.

"Mr. BOWER. Oh, no, sir.

"The CHAIRMAN. That is practically what this means. I supposed that you were coming here and wanting to use the primary horsepower to manufacture fertilizer.

"Mr. BOWER. If it does not cost too much. If it were not for that we would, but it is uneconomical to do that.

"The CHAIRMAN. Why, Col. Cooper, who is one of the best engineers in the world, said that, considering the erratic flow of the Tennessee River, it would be uneconomical to manufacture fertilizer at this plant if you sold all of your 100,000 primary horsepower.

"Mr. BOWER. And Col. Cooper stated before the Senate committee—

"The CHAIRMAN (interposing). On that matter you are putting your judgment as a representative of farmers against the judgment of one of the best hydroelectric engineers in the world.

"Mr. BOWER. I am not criticizing his standpoint as a hydroelectric engineer, but I wish to put in the hearing Col. Cooper's own statement.

"The CHAIRMAN. I can not understand why the farmers—

"Mr. BOWER (interposing). Just a moment, Mr. Chairman. Col. Cooper testified before the Senate committee: 'I have put it in on that basis. It is the basis I know something about. The fertilizer business I do not know anything about.'

"Mr. BYRNS. That is what he said here.

"The CHAIRMAN. Col. Cooper was here yesterday and testified positively that you would have to sell this primary horsepower at Muscle Shoals at the point of production, and that if you were going to use it for fertilizer you would have to use it at a basis of cost of 4.4 mills per kilowatt hour.

"Mr. BOWER. He said himself before the Senate committee that he knows nothing about the fertilizer business.

"COST OF SECONDARY POWER.

"The CHAIRMAN. And that if you sold it for commercial purposes, as you have proposed, then you could not use the secondary power and keep 2,000 or 2,500 men there at work.

"Mr. BOWER. Our thought has never been to use that big primary power unless it is cheap enough. We might agree with Col. Cooper that that is too valuable for fertilizer production purposes.

"Mr. BYRNS. Let me say that I think Col. Cooper and Gen. Taylor—and when the record is published it will be shown—made their statements in reply to hypothetical questions, assuming certain facts, put to them by the chairman, and both of them especially disclaimed any knowledge whatsoever of fertilizer or its manufacture.

"The CHAIRMAN. I can see how representatives of these power companies down there would take your attitude, but why a representative of a farmers' organization should take this attitude is something I can not understand.

"Mr. BOWER. Because we have got to get that cheap power to get our results.

"The CHAIRMAN. But look at that power as shown by plate No. 2. After you have taken 100,000 primary horsepower, as shown by the War Department's plates, which Col. Cooper states are correct, then your power falls off so rapidly that for more than 40 per cent of the year you will have to run a steam plant, which you say you can not run and produce cheap power.

"Mr. BOWER. Oh, not for 40 per cent of the year, Mr. Good.

"The CHAIRMAN. Yes; for 40 per cent of the year after you take off your primary power.

"Mr. BYRNS. Col. Cooper did not agree with that statement, Mr. Chairman. He said that that statement was based on only a few years, whereas he had taken 22 years.

"Mr. MAGEE. Col. Cooper absolutely stated, Mr. Byrns, as I understand that you could not run this plant as a fertilizer plant unless you used the primary horsepower.

"Mr. BYRNS. Oh, no; I beg to differ with you. Col. Cooper especially disclaimed any information about that, and any reply he made was in response to hypothetical questions put to him by the chairman.

"Mr. MAGEE. Of course, his statement will show about that; but, as I understand, that was his absolute, unqualified statement.

"Mr. BYRNS. He further stated that he would work out and file with his statement the results of his investigations with reference to the flow of water covering a period of 22 years, and he especially disclaimed any knowledge of that plate to which the chairman has referred.

"Mr. BOWER. I say that we want cheap power, the secondary power, for the fertilizer production. Along that line, let me show you what the limitation is in this power. This is the testimony of Mr. Milton Whitney, Chief of the Bureau of Soils, before the Senate Agriculture Committee, with reference to the production of phosphate:

"The first thing we tried was the electric furnace."

"This was with reference to the production of phosphoric acid by some new method instead of using sulphuric acid.

"We put in a mixture of phosphate rock, coke, and sand and fused it with electrodes and electric current. When this rock was in a molten condition, dense white fumes of phosphoric acids were given off, and reaction taking place and silicate of lime being formed, the phosphoric acid was set free. Those gases were put through a cottrell precipitator and we obtained phosphoric acid in a very pure form. We entered into negotiations with a commercial firm in Hoboken and made a run of six months, and at the end of that time we found that the cost of the current was so great that the cost of producing phosphoric acid by this method was about three-fourths of a cent more than by the sulphuric-acid method. We felt, therefore, that unless we could get cheap water power the electric method could not be used. As a matter of fact, our calculations were based upon electric power at \$25 per horsepower per year. If you could get electric power for \$6 to \$10 per horsepower per year you could use an electric furnace and get phosphoric acid out cheaper than you can by the sulphuric-acid method."

"Now, of course, if you are going to take Col. Cooper's position that you can not run this plan on anything except the selling price of primary power, then we have not got anything in this proposition, but we have never even thought about that.

"Mr. MAGEE. It looks to me that you can not make flesh of one and fowl of the other. If the Government is going into this business you have either got to make it an electric light and power proposition or you have got to make it a fertilizer proposition, and you can not get away from that conclusion.

"The CHAIRMAN. Mr. Bower, in making your computation, what did you figure we would have to get the secondary power for?

"Mr. BOWER. Well, I have here Mr. Whitney's statement. Of course, I have not made any computation on this. I am not capable of doing that; but Mr. Whitney's computation was that if he could get electric power for \$6 or \$10 per horsepower per year 'you could use an electric furnace and get phosphoric acid out cheaper than you can by the sulphuric-acid method.'

"Col. Cooper's cost of the secondary power is 1 and 2 mills, which, I think, figures out \$7.58 per horsepower per year.

"Mr. MAGEE. His idea was, if you will read his statement, that you should sell all the power, not distribute it but sell it, the primary and secondary power, for use in the localities.

"Mr. BOWER. I would not be surprised if the Government adopted that method, that this secondary power possibly could bring a higher price for other purposes.

"The CHAIRMAN. Col. Cooper's figure, as I recall, was 1.3 mills per kilowatt hour, or perhaps it was 1.2 mills. As I read the hearings here the department has figured 0.75 mill.

"Mr. BOWER. Yes.

"The CHAIRMAN. So that if you had to have power at 0.75 mill, then the Government would be losing the difference between 0.75 mill and 1.2 mills, which Col. Cooper says the secondary power could be sold for.

"Mr. BOWER. And that would increase the cost of cyanamid, as I gave it, on page 95 referred to before, I think it would make it \$23.04 instead of \$21.97, by taking Col. Cooper's cost of the secondary power. That is the difference between 0.75 mill and 1.2 mills.

"The CHAIRMAN. Give that increase again.

"Mr. BOWER. It is on page 95. I simply multiplied 2,808 kilowatt hours at $\frac{1}{2}$ of a mill, which would figure out \$2.10. At 1.2 mills, it would be 2,808 kilowatt

"The CHAIRMAN. Why, Mr. Bower, I am amazed that the farm bureaus are interested in building this plant to sell 100,000 primary horsepower to a British corporation.

"Mr. BOWER. Oh, no, sir.

"The CHAIRMAN. That is practically what this means. I supposed that you were coming here and wanting to use the primary horsepower to manufacture fertilizer.

"Mr. BOWER. If it does not cost too much. If it were not for that we would, but it is uneconomical to do that.

"The CHAIRMAN. Why, Col. Cooper, who is one of the best engineers in the world, said that, considering the erratic flow of the Tennessee River, it would be uneconomical to manufacture fertilizer at this plant if you sold all of your 100,000 primary horsepower.

"Mr. BOWER. And Col. Cooper stated before the Senate committee—

"The CHAIRMAN (interposing). On that matter you are putting your judgment as a representative of farmers against the judgment of one of the best hydroelectric engineers in the world.

"Mr. BOWER. I am not criticizing his standpoint as a hydroelectric engineer but I wish to put in the hearing Col. Cooper's own statement.

"The CHAIRMAN. I can not understand why the farmers—

"Mr. BOWER (interposing). Just a moment, Mr. Chairman. Col. Cooper testified before the Senate committee: 'I have put it in on that basis. It is the basis I know something about. The fertilizer business I do not know anything about.'

"Mr. BYRNS. That is what he said here.

"The CHAIRMAN. Col. Cooper was here yesterday and testified positively that you would have to sell this primary horsepower at Muscle Shoals at the point of production, and that if you were going to use it for fertilizer you would have to use it at a basis of cost of 4.4 mills per kilowatt hour.

"Mr. BOWER. He said himself before the Senate committee that he knew nothing about the fertilizer business.

"COST OF SECONDARY POWER.

"The CHAIRMAN. And that if you sold it for commercial purposes, as you have proposed, then you could not use the secondary power and keep 2,000 or 2,500 men there at work.

"Mr. BOWER. Our thought has never been to use that big primary power unless it is cheap enough. We might agree with Col. Cooper that that is too valuable for fertilizer production purposes.

"Mr. BYRNS. Let me say that I think Col. Cooper and Gen. Taylor—and when the record is published it will be shown—made their statements in reply to hypothetical questions, assuming certain facts, put to them by the chairman, and both of them especially disclaimed any knowledge whatsoever of fertilizer or its manufacture.

"The CHAIRMAN. I can see how representatives of these power companies down there would take your attitude, but why a representative of a farmers organization should take this attitude is something I can not understand.

"Mr. BOWER. Because we have got to get that cheap power to get our results.

"The CHAIRMAN. But look at that power as shown by plate No. 2. After you have taken 100,000 primary horsepower, as shown by the War Department's plates, which Col. Cooper states are correct, then your power falls off so rapidly that for more than 40 per cent of the year you will have to run a steam plant, which you say you can not run and produce cheap power.

"Mr. BOWER. Oh, not for 40 per cent of the year, Mr. Chairman.

"The CHAIRMAN. Yes; for 40 per cent of the year after you take off your primary power.

"Mr. BYRNS. Col. Cooper did not agree with that statement, Mr. Chairman. He said that that statement was based on only a few years' experience taken 22 years.

"Mr. MAGEE. Col. Cooper absolutely stated, Mr. Chairman, that you could not run this plant as a fertilizer plant on 100,000 primary horsepower.

"Mr. BYRNS. Oh, no; I beg to differ with you, Mr. Chairman. I disclaimed any information about that, and I put to him hypothetical questions.

" Mr. MAGEE. Of course, his statement will show about that; but, as I understand, that was his absolute, unqualified statement.

" Mr. BYRNS. He further stated that he would work out and file with his statement the results of his investigations with reference to the flow of water covering a period of 22 years, and he especially disclaimed any knowledge of that plate to which the chairman has referred.

" Mr. BOWER. I say that we want cheap power, the secondary power, for the fertilizer production. Along that line, let me show you what the limitation is in this power. This is the testimony of Mr. Milton Whitney, Chief of the Bureau of Soils, before the Senate Agriculture Committee, with reference to the production of phosphate:

" 'The first thing we tried was the electric furnace.'

" This was with reference to the production of phosphoric acid by some new method instead of using sulphuric acid.

" 'We put in a mixture of phosphate rock, coke, and sand and fused it with electrodes and electric current. When this rock was in a molten condition, dense white fumes of phosphoric acids were given off, and reaction taking place and silicate of lime being formed, the phosphoric acid was set free. Those gases were put through a cottrell precipitator and we obtained phosphoric acid in a very pure form. We entered into negotiations with a commercial firm in Hoboken and made a run of six months, and at the end of that time we found that the cost of the current was so great that the cost of producing phosphoric acid by this method was about three-fourths of a cent more than by the sulphuric-acid method. We felt, therefore, that unless we could get cheap water power the electric method could not be used. As a matter of fact, our calculations were based upon electric power at \$25 per horsepower per year. If you could get electric power for \$6 to \$10 per horsepower per year you could use an electric furnace and get phosphoric acid out cheaper than you can by the sulphuric-acid method.'

" Now, of course, if you are going to take Col. Cooper's position that you can not run this plan on anything except the selling price of primary power, then we have not got anything in this proposition, but we have never even thought about that.

"The CHAIRMAN. I can see how representatives of these power companies down there would take your attitude, but why a representative of a farmers organization should take this attitude is something I can not understand.

"Mr. BOWER. Because we have got to get that cheap power to get our results.

"The CHAIRMAN. But look at that power as shown by plate No. 2. After you have taken 100,000 primary horsepower, as shown by the War Department's plates, which Col. Cooper states are correct, then your power falls off so rapidly that for more than 40 per cent of the year you will have to run a steam plant, which you say you can not run and produce cheap power.

"Mr. BOWER. Oh, not for 40 per cent of the year, Mr. Good.

"The CHAIRMAN. Yes; for 40 per cent of the year after you take off your primary power.

"Mr. BYRNS. Col. Cooper did not agree with that statement, Mr. Chairman. He said that that statement was based on only a few years, whereas he had taken 22 years.

"Mr. MAGEE. Col. Cooper absolutely stated, Mr. Byrns, as I understand, that you could not run this plant as a fertilizer plant—

"Mr. BYRNS. Oh, no; I beg to differ with you. I especially disclaimed any information about that, and any—

"Mr. MAGEE. Of course, his statement will show about that; but, as I understand, that was his absolute, unqualified statement.

"Mr. BYRNS. He further stated that he would work out and file with his statement the results of his investigations with reference to the flow of water covering a period of 22 years, and he especially disclaimed any knowledge of that plate to which the chairman has referred.

"Mr. BOWER. I say that we want cheap power, the secondary power, for the fertilizer production. Along that line, let me show you what the limitation is in this power. This is the testimony of Mr. Milton Whitney, Chief of the Bureau of Soils, before the Senate Agriculture Committee, with reference to the production of phosphate:

"The first thing we tried was the electric furnace."

"This was with reference to the production of phosphoric acid by some new method instead of using sulphuric acid.

"We put in a mixture of phosphate rock, coke, and sand and fused it with electrodes and electric current. When this rock was in a molten condition, dense white fumes of phosphoric acids were given off, and reaction taking place and silicate of lime being formed, the phosphoric acid was set free. Those gases were put through a cottrell precipitator and we obtained phosphoric acid in a very pure form. We entered into negotiations with a commercial firm in Hoboken and made a run of six months, and at the end of that time we found that the cost of the current was so great that the cost of producing phosphoric acid by this method was about three-fourths of a cent more than by the sulphuric-acid method. We felt, therefore, that unless we could get cheap water power the electric method could not be used. As a matter of fact, our calculations were based upon electric power at \$25 per horsepower per year. If you could get electric power for \$6 to \$10 per horsepower per year you could use an electric furnace and get phosphoric acid out cheaper than you can by the sulphuric-acid method."

"Now, of course, if you are going to take Col. Cooper's position that you can not run this plan on anything except the selling price of primary power, then we have not got anything in this proposition, but we have never even thought about that.

"Mr. MAGEE. It looks to me that you can not make flesh of one and fowl of the other. If the Government is going into this business you have either got to make it an electric light and power proposition or you have got to make it a fertilizer proposition, and you can not get away from that conclusion.

"The CHAIRMAN. Mr. Bower, in making your computation, what did you figure you would have to get the secondary power for?

"Mr. BOWER. Well, I have here Mr. Whitney's statement. Of course, I have not made any computation on this. I am not capable of doing that; but Mr. Whitney's computation was that if he could get electric power for \$6 or \$10 per horsepower per year 'you could use an electric furnace and get phosphoric acid out cheaper than you can by the sulphuric-acid method.'

"Col. Cooper's cost of the secondary power is 1 and 2 mills, which, I think, figures out \$7.58 per horsepower per year.

"Mr. MAGEE. His idea was, if you will read his statement, that you should sell all the power, not distribute it but sell it, the primary and secondary power, for use in the localities.

"Mr. BOWER. I would not be surprised if the Government adopted that method, that this secondary power possibly could bring a higher price for other purposes.

"The CHAIRMAN. Col. Cooper's figure, as I recall, was 1.3 mills per kilowatt hour, or perhaps it was 1.2 mills. As I read the hearings here the department has figured 0.75 mill.

"Mr. BOWER. Yes.

"The CHAIRMAN. So that if you had to have power at 0.75 mill, then the Government would be losing the difference between 0.75 mill and 1.2 mills which Col. Cooper says the secondary power could be sold for.

"Mr. BOWER. And that would increase the cost of transmission, as I care it, on page 95 referred to before, I think it would make it \$2.04 instead of \$1.97, by taking Col. Cooper's cost of the secondary power. That is the difference between 0.75 mill and 1.2 mills.

"The CHAIRMAN. Give that increase again.

"Mr. BOWER. I simply multiplied 2.98 kilowatt hours at page 95. I simply multiplied 2.98 kilowatt hours at figure out \$2.10. At 1.2 mills it would be 2.98 kilowatt

um; and
least in a
ited States
able question
forward with

hours times one and two-tenths. I made that computation, but unfortunately I did not keep it. That would increase the price——

"The CHAIRMAN (interposing). About \$1.25.

"Mr. BOWER. It would be \$3.37 instead of \$2.10, an increase of \$1.27 a ton."

Mr. MARTIN. I would like to say just a word about the water power act. Our company is one of many, gentlemen of the committee, which is making developments under the water power act.

It is true that there are some 16,000,000 horsepower of applications pending, but applications for the development of well in excess of 1,000,000 horsepower have been granted and work is in progress on over 1,000,000 horsepower to be developed under the terms of the Federal water power act, in various parts of this country.

As you gentlemen know, of course, there is a limit of 50 years on the tenure of the license. That, coupled with one other very important feature, as I recall, were the two principal debatable questions before the Congress, the 50-year tenure plus the basis on which the development might be taken over at the end of the license period.

There was presented one of the most vital controversies in the whole history of the water-power development, and the position was taken by representatives of the Government and by the Congress that water power should be so developed that at the end of the 50-year period, the Government of the United States might take them over on paying what? Simply the actual, legitimate cost of development, not fair value, not just compensation, mind you, but just simply the actual, legitimate cost of the development described in the bill as the net investment in the project; that is, the net investment in the project, further limited that it should not exceed fair value. So that the Government has the right under this act to take over the project at the end of the 50-year period on refunding to the owner or developer simply his net investment, not exceeding fair value, which again is subject to deduction by such amount, if any, as the development has earned in excess of a fair return on his investment, in the meanwhile. And there is reserved further in the intervening 50 years, the right to the United States, to the State, or to any municipality to condemn and take over the development on the payment of just compensation, which involves, naturally, elements of value which are not included in the term "net investment."

Now, as to a possible renewal of the license at the end of 50 years, there is no preference to the licensee, which was one of the debatable questions, as you will recall, in Congress. If the United States does not take over the development then there arises the right of the State or municipality to take it over, and then there is that natural competition which would come between those who wished to succeed to that license over the then existing licensee, or others.

Now, as you gentlemen know the water power act undertakes to regulate the rates, service, and security issues of the licensee, first by the State or local authorities, and if none exist, by the Federal Water Power Commission, and in case the power enters into interstate commerce, then in case the regulating bodies of two or more States can not agree the question is referred to the Federal Water Power Commission.

Throughout the act there are many forms of regulations of every kind, as you gentlemen know, regulation and control. The question of extra profits, not only by actually taking any excess profits, and also by regulating rates, and many other features of which you are aware.

As to the development of water powers, public utilities are undertaking to proceed under this act, and others are undertaking to proceed under this act now. We are ready and willing to proceed under the terms of this act if Congress sees fit to permit the development to take place in this way. Now, Mr. Chairman, I am ready to submit myself to the committee for any questions the members may desire to ask.

Mr. McKENZIE. Mr. Martin, were you connected with the Alabama Power Co. in the year 1916?

Mr. MARTIN. I was, Mr. McKenzie.

Mr. McKENZIE. I take it you are familiar with the development and final enactment of the legislation known as section 124 of the national defense act?

Mr. MARTIN. Yes.

Mr. McKENZIE. Were you present in Washington during the consideration of that legislation?

Mr. MARTIN. I do not think I was—I may have been present for a short while, but I do not recall. I did not have anything to do in any way with that legislation.

Mr. McKENZIE. You were at least aware of the fact that at that time the supporters of that legislation were divided into two general classes, first, the members of Congress who ardently believed in national preparedness in time of peace, and who supported the legislation on the ground that it was going to give to the Government certain elements of national defense should we ever require the use of the same. The other class of supporters was made up of representatives in Congress who were not so particularly interested, perhaps, in the matter of national defense, and who believed that the agricultural interests of the country were entitled to some specific consideration, which they believed this legislation would give to them in supplying the fertilizer to make up for the depletion of the soil, etc. That was the situation in 1916, as I remember it. Is not that your recollection?

Mr. MARTIN. I think so, Mr. McKenzie; yes.

Mr. McKENZIE. Then the legislation had two governmental purposes back of it, did it not, national defense and the encouragement of the manufacture of fertilizer for the benefit of the agricultural interests of the country.

Mr. MARTIN. That is true, Mr. McKenzie, I think.

Mr. McKENZIE. And on that basis that legislation was enacted. You have called our attention this afternoon to a map which very clearly demonstrates to my mind that so far as a power proposition is concerned the Alabama Power Co. is splendidly located and undoubtedly has a brilliant future ahead of it, and if you can get control of Muscle Shoals and the power that may be generated there it will add to the expansion and success of your company.

Mr. MARTIN. And to the public welfare.

Mr. McKENZIE. But I can not refrain from stating that as I view the matter it occurs to me that your contention and your proposed plan, while it would take into consideration the interests of the industrial people of that section of the country, and those living in the cities and towns of Alabama and Mississippi, and neighboring States, is wholly unmindful, it seems to me, of any suggestion that would be a benefit to the hundreds of thousands of people living in the homes scattered over that section of the country and known as agriculturists.

Now, the proposition that the Government entered upon, as we understand it, was having those people in mind, and not only having the people of Alabama, Mississippi, and the neighboring States in mind, but even those of the far West in putting into effect a plan that would propose to reduce the cost of agricultural products to the country, and which would benefit the people of the whole United States; is that not correct?

Mr. MARTIN. Yes.

Mr. McKENZIE. And the other other proposition——

Mr. MARTIN (interposing). I want to qualify my answer to your question by saying that I can not altogether accept your hypothesis. I would like to answer you when you get through, Mr. McKenzie.

Mr. McKENZIE. All right. That was the argument at that time, as I recall it, and the conclusion that Congress came to was the enactment of this legislation, that it would provide for two things, first, the national defense, in the interests of all the people; and second, that it would provide means whereby, perhaps, fertilizer could be produced at a cheaper cost to the farmer, and thereby indirectly benefit all the people of the United States. Now, time has passed on since that legislation provided that the Government should enter into this program of manufacture; the Government failed to do it. Now we are confronted with the situation of either the Government building and completing Dam No. 2 and proceeding with this as a governmental activity, or turning it over to some private interests, and that is what we have before us to-day to determine, if we can, as a committee. On that proposition we have a number of offers but we have yours before us at the present time. We have Mr. Ford's offer.

The CHAIRMAN. And we have just received one from Mr. Engstrum.

Mr. McKENZIE. And we have just received this offer from Mr. Engstrum; and I think it is fair to say that in Mr. Ford's offer he does assume, at least in a way, to carry out the original intention of the Congress of the United States in connection with this matter. Whether he will or not is a debatable question that is not before us to discuss at his time. Your company comes forward with a proposition that is entirely different.

Mr. MARTIN. It is entirely different from Mr. Ford's.

Mr. McKENZIE. It is entirely different, as I understand it, and I presume as you understand it. Is that correct?

Mr. MARTIN. Well, it is different; yes. I think it is entirely different.

Mr. McKENZIE. Your proposition is more in the nature of a proposition to buy the property that the Government has to sell and dispose of certain rights without assuming any obligation to carry out the original intention of Congress so far as this proposition is concerned.

Mr. MARTIN. We do, Mr. McKENZIE, in this way: We undertake to make a development to provide the Government with power making a water-power development to provide power for the operation of the plants. We undertake to provide the Government with power with which to operate the plants or which it may lease or sell to others to be used in the operation of a plant. The very purpose of building up this water power is to provide power for that purpose, and we propose to provide the Government with the power, and it is a very large volume of power, which we believe is a very large contribution to the program of fertilizer development.

Mr. McKENZIE. I think it is fair to state at this point that so far as Congress is concerned, or many of us, at least, when we entered upon this proposition that the governmental activities, so far as manufacturing is concerned, were to be only experimental, and that it was not to be a fixed policy of the Government to continue in the manufacturing business. As I understand your proposition, you are after the water power; it is a power proposition so far as your company is concerned, with the other matters incidental.

Mr. MARTIN. We propose to give the Government 100,000 horsepower, which prior to the present hearings was sufficient, in the judgment of those who were very much interested in this project.

Mr. McKENZIE. But that is a secondary proposition, so far as your proposition is concerned.

Mr. MARTIN. That is a secondary power proposition.

Mr. McKENZIE. That is a secondary proposition. You do certain things and you give to the Government 100,000 secondary horsepower.

Mr. MARTIN. It will be a charge on the development as to make it always available.

Mr. McKENZIE. In that way your offer differs from Mr. Ford's. Mr. Ford in his offer makes that the primary purpose. He does not say he will use secondary power, but he says he will use primary power; he does not say so in so many words, but that is what the proposition means, that he will proceed to change those plants and engage in the manufacture of nitrates to the amount of 110,000 tons of ammonium nitrate.

Mr. MARTIN. Mr. McKENZIE, if you will permit, I want to ask you a question there.

Mr. McKENZIE. All right.

Mr. MARTIN. There is a difference between primary power and secondary power. Primary power has a market value; it is of more value than secondary power.

Mr. McKENZIE. I understand that.

Mr. MARTIN. Is anyone going to use primary power for a purpose such as the manufacture of fertilizer, or for any other industrial use, when he can put it to a greater use and to greater advantage? And, on the other hand, using secondary power produces the same result. Side by side we have the two classes of power; with either one you can produce the same result. As a matter of pure, true economics you are going to use the secondary power in the manufacture of fertilizer, because it can be done with secondary power; according to the people who have studied it, primary power can be put to other uses for which secondary power can not be used.

Mr. McKENZIE. I presume your statement is correct, but if a man has an option to buy, and in entering into a contract to use this power he had to do certain things, he would probably use both primary and secondary power, or use primary power entirely at certain times and other times secondary power.

Mr. MARTIN. Of course, there is no agreement that any particular power will be used, or what power, in other proposals.

Mr. McKENZIE. Let us see what you offer to do in connection with this offer of yours. You offer to buy the Warrior plant. The cost of that was, as I have it, \$4,676,000, including the plant and transmission line. You desire to buy that?

Mr. MARTIN. Yes, sir.

Mr. McKENZIE. Then you desire to buy the steam plant at No. 2, which cost \$12,326,392; you want to buy that. Then you want to take over the dam, on

which \$17,000,000 have been expended. That makes \$34,200,392, at war cost. If you deduct 40 per cent, which I spoke about yesterday, for war-time discounts, that will leave \$20,401,434 worth of property as a going value, would it not?

Mr. MARTIN. You are coming down to what you say is the reproduction cost.

Mr. McKENZIE. Yes. Taking off 40 per cent from the whole cost.

Mr. MARTIN. Assuming that the entire development could have been produced for 60 per cent up to date, that it would require 60 per cent of the original cost to produce the power development—I have not compared your figures.

Mr. McKENZIE. You are buying this property as a going property. The steam plant is certainly in condition to be operated.

Mr. MARTIN. It is now; yes.

Mr. McKENZIE. The Government's addition to your own plant is in good condition?

Mr. MARTIN. Of course, the water-power development, in so far as it has progressed is not going; it is just standing idle until it is completed.

Mr. McKENZIE. I am speaking of these plants.

Mr. MARTIN. Yes. The plants—

Mr. McKENZIE (interposing). Then you would get the advantage of the \$17,000,000 expended on the dam.

Mr. MARTIN. That is quite true.

Mr. McKENZIE. Then, that would make \$20,401,434 of what we might consider as actual, fair value, would it not? We could consider it in that way, could we not?

Mr. MARTIN. We will assume that for the purpose of your question.

Mr. McKENZIE. For that you offer to pay the Government \$5,000,000, less whatever it may cost to build the locks at Dam No. 2, which you want to deduct from the \$5,000,000, as I understand it. If I am wrong, I want to be corrected on that.

Mr. MARTIN. And then the 100,000 horsepower.

Mr. McKENZIE. I understand; I will come to that in a moment. But for the \$20,401,434 worth of property, as a fair value, you propose to give the Government \$5,000,000, and then you propose to deduct from the \$5,000,000 whatever the lock may cost; and the Army engineers, as I understand it, estimate the cost of that lock to be \$4,500,000.

Mr. MARTIN. No; my understanding is that the Secretary of War estimates it to be \$2,500,000.

Mr. McKENZIE. That is the Secretary of War's statement, but the engineers have estimated the cost of the lock as \$4,500,000.

Mr. MARTIN. I have not seen any such figures, and I believe you find the figures of \$4,500,000 include the locks at two developments.

Mr. McKENZIE. I will not stop to argue that now.

Mr. FIELDS. Col. Cooper stated that.

Mr. MARTIN. I am not prepared to say it would not cost that at the two developments, at Locks 2 and 3, but I think you will find that the cost of the locks at Dam No. 2 would be \$2,500,000.

Mr. McKENZIE. In case it should cost \$4,500,000, then you would pay to the Government the sum of \$500,000.

Mr. MARTIN. No; we pay this actual money that goes into the locks. But, of course, whether the locks cost \$2,000,000 or \$3,000,000 or \$4,000,000, we propose to pay \$5,000,000 to the Government.

Mr. McKENZIE. If I read your proposition correctly, you deduct that amount.

Mr. MARTIN. That is in effect the payment to the Government, though.

Mr. McKENZIE. Now, then, in addition to that, you propose to give to the Government what else?

Mr. MARTIN. 100,000 horsepower.

Mr. McKENZIE. Secondary horsepower?

Mr. MARTIN. Well, 100,000 secondary horsepower and power for the operation of the locks, and to maintain and operate the dam, the gates, and the powerhouse during the license period.

Mr. McKENZIE. And to furnish power necessary to do that?

Mr. MARTIN. For operating the locks, yes. That is quite incidental, or quite small, but those are considerations which are also involved.

Mr. McKENZIE. What do you say the primary power is at Dam No. 1?

Mr. MARTIN. You mean Dam No. 2?

Mr. McKENZIE. Yes; Dam No. 2.

Mr. MARTIN. My chief engineer says that it is somewhere between 80,000 and 100,000 horsepower.

Mr. MCKENZIE. In what portion of the year do you estimate under that statement there would be 100,000 horsepower to turn over to the Government?

Mr. MARTIN. Approximately 82 per cent of the time the power will be available, according to the stream-flow records which have been calculated for a period of 40 years.

Mr. MCKENZIE. Getting right back to your plan, you propose to pay the amount of money which has been stated for the property which I have mentioned, and to give the Government, when you have it, 100,000 secondary horsepower, with which the Government will be permitted to operate the nitrate plant, or any lessee of the Government will be permitted to operate it?

Mr. MARTIN. That is correct.

Mr. MCKENZIE. And the 100,000 primary horsepower you would sell to the industrial interests of the surrounding country?

Mr. MARTIN. For lighting, power, and industrial purposes; yes.

Mr. MCKENZIE. As a business man, Mr. Martin, could you be induced to take out a lease to operate that nitrate plant under those conditions?

Mr. MARTIN. I have stated to you that it has been frequently stated before other committees that this very class of secondary power can be used. Mr. Swann of the Federal Phosphorus Co. is prepared to undertake the developments in his own particular work, using secondary power. Mr. Bower has testified before another committee of Congress that this very class of secondary power can be used.

Mr. MCKENZIE. Then you think that the Government, with those two splendid plants standing there, on which it has spent so many, many millions of dollars, would be getting a good bargain to simply retain them, and then await the pleasure of the Alabama Power Co. to give them some secondary horsepower with which they might operate? You think that is a fair proposition.

Mr. MARTIN. Not in the way you have expressed it, Mr. McKenzie.

Mr. MCKENZIE. Is not that about the fact?

Mr. MARTIN. It is not awaiting our pleasure; it is awaiting the completion of this development, and we simply propose to do that which those interested in this development have from the beginning down to the past few weeks insisted should be done, namely, that this very class of secondary power referred to in our proposition, should be used in the manufacture of fertilizer.

Mr. MCKENZIE. I will say this, if the Government sees fit to go into a proposition of this kind, I would be the last man to ever criticize it afterwards. But so far as my own point of view on the matter is concerned, I want to say that I can not see where the Government would get off under such a proposition as this. It seems to me it would not be a very profitable deal for the Government, if it ever had any idea of manufacturing anything.

But I do not want to take up the time of the committee any further, so I will call on Mr. Greene.

Mr. GREENE. Mr. Martin, you are proceeding on the general theory that if there is a public advantage in this thing at all, it is probably more largely to be through the experience in the dispersion of power through a great area and for heating and lighting and industrial purposes than to be concentrated at Muscle Shoals for the manufacture of fertilizer. I am trying to get at your idea about it. In other words, your idea of public policy—because, if you will permit me we are more likely concerned here with public policy first than with the varying details of the proposition—is as I have stated.

Mr. MARTIN. Let me suggest this: It has been stated in these hearings within the past week or two that 100,000 horsepower would be used as a maximum in the manufacture of fertilizer at this development. The plans which are being considered provide that the Government—that is, other plans—shall finance and complete a total of 850,000 horsepower, 100,000 primary power, and 750,000 secondary horsepower. It has never been suggested here that that 750,000 horsepower be devoted to the fertilizer business. It has been my understanding from these hearings, and it is my understanding now, that a very small part of this power development of 850,000 horsepower would be used in the manufacture of fertilizer, and therefore I believe that this plan of ours makes available for the manufacture of fertilizer that power and all the power which by any other plan will be used in the manufacture of fertilizer.

Mr. GREENE. That is your interpretation of the comparison of the two propositions, Mr. Ford's and yours. But we are assuming—and I hope altogether with confidence—that as citizens, either members of the committee or witnesses before it, we must approach this proposition with the idea of its effect as a public policy for the future.

Mr. MARTIN. That is quite correct.

Mr. GREENE. Regardless of the private interests of any people who make proposition to us, anticipated or real. You hold, therefore, as I understand it, that this Muscle Shoals power might, consistent with good business and economics, be employed first as a preliminary to the distribution of power throughout this great area for home lighting, for incidental municipal uses, and for industrial purposes, and still reserve power at Muscle Shoals that could be employed in the first instance for fertilizer production, and, as a matter of public policy, it is better so to distribute that power than to concentrate in one hand at Muscle Shoals, ostensibly for fertilizer purposes.

Mr. MARTIN. I think I am correct in this statement, that in the manufacture of fertilizer you have to bear in mind that when manufactured it must be transported to the locality of use. It has never been suggested here that at Muscle Shoals or at Keokuk or in the West, all fertilizer to be used in this country should be manufactured. To the contrary, it has been suggested to you that you have to get down to this—that is, manufacture all the fertilizer at different points, so that the question of freight rates to the points of use will be equalized. You could not manufacture all the fertilizer at one place and ship it throughout the United States, because by the time you get it there the freight charges would be prohibitive. That is my understanding or suggestion, first.

In the next place, if power is going to be used in the manufacture of fertilizer, a limited amount of power is going to be used, a certain amount is going to be used, and no more. Therefore we present a plan by which this limited amount of power is available and can be used, and at the same time the balance of that power may be devoted to public use, and any class of public use that may arise, industrial or otherwise, here in this locality or in other localities.

Mr. GREENE. You are basing your idea, then, on the amount of power that may be appropriated to the fertilizer production upon the evident intent of section 124 of the national defense act, which clearly sets out that the Government did not then intend to set up a fertilizer manufacturing proposition for distribution purposes, as I understand it; because that act starts off with this introductory phrase:

"The President of the United States is hereby authorized and empowered to make, or cause to be made, such investigation as in his judgment is necessary to determine the best, cheapest, and most available means for the production of nitrates and other products for munitions of war and useful in the manufacture of fertilizers and other useful products by water power or any other power, as in his judgment is the best and cheapest to use."

You are basing it on the idea that this law did not contemplate the establishment at Muscle Shoals of a great, centralized fertilizer-producing factory, but an experimental station.

Mr. MARTIN. Probably both; but simply as a matter of pure economics I suggest to you that you can not build a single plant at any place in the United States to supply all the fertilizer needs.

Mr. GREENE. What is your interpretation of that law? What was the intention there in the first place?

Mr. MARTIN. As to establishing a plant?

Mr. GREENE. Yes.

Mr. MARTIN. It is very evident that a plant was to be established which would be available for the manufacture of munitions of war and fertilizer.

Mr. GREENE. Did you understand it was to be a commercial proposition or that it was to be a matter of investigation and experiment?

Mr. MARTIN. In the law?

Mr. GREENE. Yes.

Mr. MARTIN. I see what your idea is. I did not understand the point you were making at first.

Mr. GREENE. It would make a great difference in the amount of water power to be consumed, or that the Government was under any obligation to employ there. The interpretation of that act would make a great difference as to that

proposition, as to whether you could separate the power fairly, so as to comply with the terms of the act, and at the same time employ the great residue of that power for other purposes equally useful.

Mr. MARTIN. As a matter of engineering, or a business matter, there would be no difficulty in defining the status, practically, as between primary and secondary power. That is a matter that can be worked out as between the different uses, as to the broad question of whether the entire development should be devoted to fertilizer—of course, if that is the case—

Mr. GREENE (Interposing). What I am getting to is this: It seems to me that possibly there is a confusion occasionally in the application of the argument, because Mr. Henry Ford has introduced the idea of the establishment of a great fertilizer factory, with general distribution, and constant reference is being made to this act, which I never read in that way. It was introduced into the law on the pretext that it would be a demonstration and an experiment proposition and an investigating thing. This site was not even established at Muscle Shoals at that time.

Mr. MARTIN. If it is merely an experimental station, of course, 100,000 horsepower is a great deal more than will ever be needed for an experimental station. If that is the intent of the law, it will be easily complied with. On the other hand, if there is to be a plant there to supply those things which the plant should supply, having regard to the question of railroad freight rates again, the 100,000 horsepower would, as I understand the subject, be sufficient.

Mr. GREENE. Then we are to understand that you first differ from Mr. Henry Ford's proposition on the theory that you can employ the greater part of this power for better uses for the general public benefit than to concentrate its use more or less locally in the production of fertilizer or in the production of such things as he may need for his automobile business? That is your first proposition?

Mr. MARTIN. I say if part of this power is to be used industrially, then it is better for it to be distributed to the public at large by a public-service company than to confine it to a single, private use.

Mr. GREENE. Passing to the next proposition—the economics of the thing—wherein do you maintain that your proposition, in money and finance, is more to the advantage of the Government than Mr. Ford's proposition? You have covered, of course, discursively, that same thing, but if you can concentrate it in something that we can remember, it will help us very much, because we will have to make these comparisons later ourselves.

Mr. MARTIN. First of all, it is a question of how much money the Government will have to appropriate first and last for these two power developments. On the one hand, it has been variously estimated that \$50,000,000 of capital, plus whatever interest there may be during construction, will increase that amount. None of the money is to be appropriated under the plan we propose. That is one advantage.

In the second place, the Government will dispose of these two nitrate plants, including the steam plant and equipment, for \$5,000,000, under another offer, whereas we suggest that the Government sell simply the steam plant and equipment and retain the nitrate plants. I believe some one stated that the two nitrate plants represent some \$75,000,000 of Government investment. That the Government retains, under our proposition. In addition, we have the Government's investment of \$17,000,000 presently made in the incomplete Wilson Dam. No one has suggested that the Government get any return upon that \$17,000,000, except by way of an annual amortization fund. We propose to give the Government this 100,000 horsepower, plus \$5,000,000 for the work that has been done at the Wilson Dam and the steam plant and equipment, and to finance the Wilson Dam to its completion. The obligation to finance this property to its completion, the obligation to pay \$5,000,000, the obligation to deliver the Government 100,000 horsepower—that is included in our offer—and in addition to that, as a fourth contribution to this situation, we undertake to maintain the dams and the gates throughout the 50-year lease period. All those things you have got to look to.

There has been testimony brought to you here, I believe, which is already in the record, as to the obligation the Government would assume under another offer for the maintenance of the dams and gates. That is a very substantial obligation, which I believe the Secretary of War referred to in his letter in regard to the maintenance of the dams and gates throughout the 50-year period. We undertake to meet that obligation. Under another offer the Government meets that except for certain annual payments fixed in amount, and whatever

balance there may be by way of maintenance of those two items the Government is to take care of. Our obligation runs for 50 years, and under another proposal the obligations of the Government and of the licensee or purchaser would run for 100 years.

Mr. GREENE. That is your statement of the advantages you urge in your proposition over Mr. Ford's proposition?

Mr. MARTIN. Of course, there is the great question of the right of recapture at the end of 50 years on the payment of the net investment. No one can to-day calculate the value of a water power 50 years from now. Where there is no right of recapture, where it runs for 100 years or more, in perpetuity, who is there to-day who can calculate the capital value of that lease-hold or property right at the end of 50 years.

On the other hand, whatever net dollars go into this project in the intervening 50 years, that is the basis on which the Government may take it over less any return there might be in excess of a fair return in the public service. It is not likely there will be anything in excess of a fair return. I do not see how there can be anything in excess of a fair return because the Government or public authorities regulate the rates on the one hand and the Government will take by expropriation annually anything over a fair return under the present rules and regulations of the Federal Water Power Commission.

Mr. GREENE. Then that presents in a more or less succinct manner your contention in regard to the advantages of your proposal over Mr. Ford's proposal.

Mr. MARTIN. That presents the viewpoint of our proposition.

There is one other thing, Mr. Greene: The Federal water power act contains a provision referred to by the Secretary of War with regard to taking over and operating water-power projects during time of war. That is a very broad provision which the Secretary refers to in the water power act, and it is broader in its terms than the provision contained in the proposition of Mr. Ford—very much broader. That provision and its full scope, by virtue of the water power act, is read into and becomes a part of every license issued under the terms of that act.

Mr. GREENE. I wanted the record to show about what you hold to be the advantages of your offer.

Mr. HULL. Your proposition is for Dam No. 2?

Mr. MARTIN. Yes.

Mr. HULL. You do not propose to develop Dam No. 3 or Dam No. 1?

Mr. MARTIN. Not now. When industrial or commercial conditions require power from Dam No. 3, it can be developed.

Mr. HULL. If you develop Dam No. 3, you would increase the development at Dam No. 2?

Mr. MARTIN. We would increase the power at Dam No. 2.

Mr. HULL. Yes; you would increase the power to some extent—the primary power at Dam No. 2—as I understand it.

Mr. MARTIN. To some extent; but you will remember that Dam No. 3 is not a storage development.

Mr. HULL. It would, however, to some extent?

Mr. MARTIN. It will help; still, simply as a matter of regulation—

Mr. HULL (interposing). Would the development you propose make the river navigable?

Mr. MARTIN. No, sir; it will, however, make the river navigable to the extent of the pool created by Dam No. 2.

Mr. HULL. Putting in the lock would be useless without a further development at Dam No. 3 and Dam No. 1?

Mr. MARTIN. Further development at Dam No. 3; then, of course, there are, I believe, five or six other dams to be built after you built Dam No. 3, between that point and Hales Bar before the development for navigation on the river is complete. This is one end of that proposition.

Mr. HULL. If we accepted your proposition there would be no positive assurance that in the future we would have nitrates for war purposes, because you do not propose to maintain plant No. 2 in condition to produce nitrates?

Mr. MARTIN. No; we do not undertake any obligations with respect to plant No. 2; but we undertake to give the Government power and money.

Mr. HULL. You propose to give the Government secondary power?

Mr. MARTIN. Yes.

Mr. HULL. At plant No. 2?

Mr. MARTIN. Yes.

Mr. HULL. Now, there are several different kinds of secondary power, as I understand this proposition, especially in a flow of water as variable as that

in the Tennessee River. Secondary power might be very inefficient or it might be very good power. What is there to assure us that we will get first-class secondary power?

Mr. MARTIN. The contract you make would insure it.

Mr. HULL. You propose to give us first-class secondary power?

Mr. MARTIN. Yes, sir; that is the stipulation. Our offer says, "This power to be the second 100,000 horsepower at any time available from the normal flow of the river." That is the second 100,000.

Mr. HULL. The second 100,000?

Mr. MARTIN. Yes; it is a matter of engineering; that is ascertainable.

Mr. HULL. Is there any mention of plant No. 1 in your proposition?

Mr. MARTIN. No, sir.

Mr. HULL. That you do not propose to buy at all?

Mr. MARTIN. No, sir.

Mr. HULL. That would remain in the possession of the Government?

Mr. MARTIN. Yes, sir.

Mr. MILLER. By the acquisition of the Muscle Shoals property, as you have explained it—that is, the Muscle Shoals hydroelectric power—the Alabama Power Co. would have almost the entire hydroelectric output of the southeast portion of the United States; that is the idea you are proceeding on?

Mr. MARTIN. No; there are a great many developments in other States, other sections of the South, which we have no interest in.

Mr. MILLER. I understood from your preliminary statement that in connection with these other projects you had surveyed and hooked them up with the Muscle Shoals proposition?

Mr. MARTIN. Yes; in Alabama.

Mr. MILLER. In Alabama?

Mr. MARTIN. Yes. It was our suggestion that this Tallapoosa River project, which has been associated with this Muscle Shoals proposition in our own plans, can be developed as a storage proposition, and in connection with this property, produce power in greater volume than Muscle Shoals can produce alone. Of course the Tallapoosa River project as a storage project is not economical; it is not of value; it can not be made of value except as a storage development in connection with some large development. That is the plan we are proceeding on.

Mr. MILLER. Then, generally speaking, it is your plan to use the power plant at nitrate plant No. 2 as a reserve station?

Mr. MARTIN. The steam plant?

Mr. MILLER. The steam plant.

Mr. MARTIN. As a further reserve station.

Mr. MILLER. In connection with the Warrior steam plant; that is what you have in mind?

Mr. MARTIN. In connection with the entire development?

Mr. MILLER. Your proposition leaves the entire property of the Government's enterprise at Muscle Shoals in the hands of the United States; that is, the title to it—with the exception of the steam plant at nitrate plant No. 2 and the Warrior steam plant, whatever interest you will have there.

Mr. MARTIN. Yes; and the Wilson Dam development, of course.

Mr. MILLER. To develop this Dam No. 2 under the Federal water power act, and subject to all the provisions thereof?

Mr. MARTIN. Yes.

Mr. MILLER. I notice a little provision here in your bid, Mr. Martin. I do not want to be technical in connection with the matter, at all, but in the second clause on page 3 of the Secretary of War's report—that is, the second paragraph of your offer—you provide, "To furnish free to the Government, or anyone it may designate, from the hydro power plant 100,000 horsepower as required for the production of fertilizers and munitions of war and for research in connection therewith; and if, due to changes in the art, this use of such 100,000 horsepower is discontinued by the Government, the Alabama Power Co. to purchase and pay for same in accordance with a schedule to be set forth in the license. This power to be the second 100,000 horsepower at any time available from the normal flow of the river."

Now, suppose a system should be organized there and installed at nitrate plant No. 2 by which the maximum production of that plant may be put out with less than 100,000 horsepower?

Mr. MARTIN. That is quite likely.

Mr. MILLER. Suppose that in the future—and we are looking far into the future in connection with this proposition—the manufacture of fertilizer should so go forward in its evolutionary stage that it would become necessary and might be desirable to greatly extend the present nitrate plant No. 2 in its annual producing capacity of fertilizer. Would that 100,000 horsepower be available for any such expansion that the United States Government may make, or is it limited to the present capacity of the present plant?

Mr. MARTIN. I did not have in view any limitation of that kind.

Mr. MILLER. I know, and I do not want to be over nice in these things; but I wondered what was in your mind, and would it cover a contingency of that character?

Mr. MARTIN. Of course the Government would have it, and the contract in connection with this whole matter would undoubtedly cover it.

Mr. MILLER. In other words, 100,000 horsepower would be available for such uses as the Government desired to put it to. Suppose the Government wanted to establish an arsenal there, or some other industry entirely apart from the manufacture of ammonium nitrate. Would the 100,000 horsepower you agree to furnish free of charge be available for such governmental uses and purposes as the Government might desire to establish there?

Mr. MARTIN. We had in mind that, in general, the production of fertilizer and munitions of war would be carried on there; whatever that might be is a matter we have made no point about.

Mr. MILLER. My attention was attracted to this language that I read to you, and I did not know whether that was a limitation of the use of the horsepower.

Mr. MARTIN. No, sir; we simply meant to say that if the Government did not use this power—

Mr. MILLER (interposing). That is what I am getting at.

Mr. MARTIN. Then we would purchase it, whether due to changes in the art or any other reason, if the Government wants to sell it.

Mr. MILLER. So you propose to furnish the Government 100,000 horsepower for such purposes as the Government needs it for, and if the Government does not use all of it, then you would purchase what the Government does not use?

Mr. MARTIN. Yes; we had in mind that, in a general way, these purposes would be governmental purposes. We did not think the Government would go into the business of selling this power; but we would hold the power available for the Government for these general purposes.

Mr. MILLER. Your proposition for the Muscle Shoals enterprise—that is, the operation of the hydroelectric end of it under the Federal water power act—is really attractive; it conforms to the governmental policy.

Mr. MARTIN. We feel that it does.

Mr. MILLER. That portion of it; and I want to say the proposition is very tersely, comprehensively, and briefly put forward. You, of course, are to receive the benefit of what money the Government has already put in dam No. 2.

Mr. MARTIN. Yes; that goes as a part of the project.

Mr. MILLER. And give a free and full title to it?

Mr. MARTIN. Yes.

Mr. MILLER. Would that fund that is in there now cut any figure in the recapture clause, or would it be simply on your investment?

Mr. MARTIN. On our investment.

Mr. MILLER. It would cut no figure in the recapture clause?

Mr. MARTIN. I do not see how it would. It is a matter of bookkeeping. The Government, through the Federal Water Power Commission, keeps books against us in all these matters now, according to a prescribed method, and our net investment is ascertainable at any time.

Mr. MILLER. This proposition of yours is to build an enterprise under the Federal water power act within a reasonable length of time. What have your engineers advised you would be the probable length of time, if there has been any such advice given to you?

Mr. MARTIN. From 30 to 36 months.

Mr. MILLER. You are figuring then on the completion of the entire proposition within three years, or at least by the end of three years' time?

Mr. MARTIN. Yes; installing 240,000 horsepower. Of course, so far as subsequent installations are concerned, the Federal water power act provides that installations shall be made from time to time in any project to meet the power demands. We simply suggest that the power demands for that period will be at least 240,000 horsepower, and we assume that obligation. There may be

much more as the work progresses, in which case we would go forward and meet whatever status the public demand requires.

Mr. MILLER. Two hundred and forty thousand horsepower includes both primary and secondary power?

Mr. MARTIN. Yes.

Mr. MILLER. To generate 240,000 horsepower, how high, according to the present plans and specifications would the dam be constructed?

Mr. MARTIN. Ninety-two feet.

Mr. MILLER. The completed dam is a 94½-foot fall of water?

Mr. MARTIN. Whatever the completed dam is; whatever the present levels may require.

Mr. MILLER. Is it your idea to go ahead and complete this dam?

Mr. MARTIN. Yes.

Mr. MILLER. To complete it entirely?

Mr. MARTIN. Yes.

Mr. MILLER. According to the plans that now exist there for it?

Mr. MARTIN. Yes.

Mr. MILLER. With a 94½-foot fall of water?

Mr. MARTIN. Yes. Under the Federal water power act rules and regulations no development is made on a navigable river except according to plans approved by the Chief of Engineers, the Secretary of War, and the Federal Power Commission. Therefore, of course, we assume the obligation to complete this development according to the plans of the engineering department of the War Department, the Secretary of War, and the Federal Power Commission.

Mr. MILLER. Then your proposition is to complete the dam under the specifications now existing in the War Department?

Mr. MARTIN. Yes, sir.

Mr. MILLER. On which work has progressed about 30 per cent?

Mr. MARTIN. Yes.

Mr. MILLER. When you complete that dam it will generate much more than 240,000 horsepower, will it not?

Mr. MARTIN. There will be the water there, but we will not necessarily install large wheels in the power house.

Mr. MILLER. I see. You will complete the dam, but the machinery you will install will depend upon the demand for the power?

Mr. MARTIN. Yes, sir. We have to provide at once for all the equipment. You have to create your foundations for your machinery and for the entire layout; you have to make provisions for those things. We do not necessarily install the entire equipment at one time. We will install equipment and machinery in the space left for the additional units when the additional business requires.

Mr. MILLER. By the completion of the dam the power will be available any time you desire to expand the power-house equipment?

Mr. MARTIN. Yes, sir.

(Thereupon the committee adjourned to meet to-morrow, Wednesday, March 1, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES,
Wednesday, March 1, 1922.

The committee met at 10.30 o'clock a. m., Hon. John C. McKenzie (acting chairman) presiding.

**ADDITIONAL STATEMENT OF HON. S. HUBERT DENT, JR.,
ATTORNEY FOR THE ALABAMA POWER CO.**

Mr. DENT. Mr. Chairman and gentlemen of the committee, I feel like apologizing to the committee for taking up any more of its time in discussing the legal aspects of the rights of the Alabama Power Co. in connection with the Gorgas plant, and would not ask the committee to indulge me again, were it not for the fact that my friend, Mr. Oliver, of Alabama, I understand, addressed the committee on the legal aspects of that proposition and announced, to my mind, some rather startling propositions of law.

In the first place, I understand he raises the question that under the act of July 9, 1918, the contract must be made by the heads of the various departments, and that the heads of the departments are the Cabinet officers.

Well, I will not take issue with him on that proposition, and if the committee takes that view of the matter we would ask the further indulgence of the committee to introduce the testimony of Maj. Booten, of the Ordnance Department, who has the records of that department in reference to Ordnance contracts. I interviewed Maj. Booten yesterday afternoon at his office and saw the records, and his testimony will disclose that the Secretary of War authorized Maj. Gen. Williams, Chief of Ordnance, to make contracts in his department in the name of the Secretary and to nominate officers in his department as contracting officers, and that Lieut. Col. William Williams, who signed this contract, was one of the contracting officers named by Maj. Gen. Williams, Chief of Ordnance. I understand that Maj. Booten is ready to come before the committee with these records at any time that suits the convenience of the committee. So the facts that will be disclosed by Maj. Booten's testimony will completely cover the argument of Mr. Oliver that the head of the department means the Cabinet officer.

Mr. McKENZIE. If I understand you, it is your contention that one of the heads of departments, such as a Cabinet officer, would have the power under the law to redelegate authority delegated to him by Congress?

Mr. DENT. Surely.

Mr. McKENZIE. In a matter of this kind?

Mr. DENT. Yes; in view of the language of the act, which does not say it must be done by the head of the department, but through the heads of the departments, and that otherwise any other construction would render the act impractical, because it would have been a matter of physical impossibility for the Secretary of War himself to have signed every war contract that was made. That would have been absurd on its face.

Now, so much for that proposition, which will be answered, as I stated, by the facts.

Mr. FISHER. I would like to ask you a question before you branch off from that point.

Mr. DENT. All right, Mr. Fisher.

Mr. FISHER. I would like to know who was the lawyer for the Alabama Power Co. through all these proceedings leading up to the signing of the contract on the day of the fake announcement of the armistice. We had testimony from the Air Nitrates Corporation that the lawyer representing them—who is now dead—reached the conclusion that they could not take an option; that it would be illegal to take an option from the Government to sell after the war; and that they consulted other counsel, but that that counsel was now out of the city, and I would like to know whether or not there was a law firm or any other lawyer, other than Mr. Martin himself, who was negotiating for the Alabama Power Co. in drafting the terms of the contract.

Mr. DENT. Of course, I could not answer that myself, Mr. Fisher, personally, because I was not connected with the Alabama Power Co. at that time, but Mr. Martin can.

Mr. FISHER. Then I will ask Mr. Martin when he goes on.

Mr. DENT. As I understand Mr. Oliver's argument, he contends that when Congress by legislative action declares that certain property is necessary for a public use, that that is binding upon the courts and that the courts can not go behind that declaration of Congress. That is his first and his main proposition. Second, that the head of a department must be a Cabinet officer, which I have already answered. Third, that the right to sell does not include the right to postpone the date of the sale or to agree to arbitration. Fourth, that the act of July 9, 1918, does not apply to property to be used subsequent to the war, whatever that means. And fifth, that the proviso to the act of July 9, 1918, which he quotes in his remarks, expired by its own limitation a few months after the passage of the act, by reason of the fact that the Secretary of War was required to make a report to Congress.

I believe that those are the main and principal propositions that my friend, Mr. Oliver, asserted before the committee on yesterday.

It is rather difficult, Mr. Chairman, and I consider it absolutely unnecessary, to go into any extended argument before this committee on the right of Congress to declare certain property necessary and essential for public use and bind the courts. The fact is I have not had a chance to run down the authorities myself, but even if I had them I would not weary this committee with a long

citation of authorities upon the subject, but I will call the attention of the committee to one case which occurs to me, because I have read it recently, having a condemnation case now pending in the Federal court at Montgomery, and that is the case of the United States v. The Gettysburg Electric Railroad Co., in 160, U. S.

Congress a number of years ago, in one of the appropriation bills, provided an appropriation and enacted legislation as a rider on the bill, providing for the establishment of Gettysburg Park, the establishment of the battle lines of the Union and Confederate forces there and the marking of the grounds and the preservation of the battlefield as a Government park.

The Gettysburg Electric Railroad Co. had certain rights of way in that property and they contested the power of Congress to take away their rights. The case went to the Supreme Court of the United States, and in a very elaborate opinion by Mr. Justice Peckham, which was the unanimous opinion of the court, the court held that it was a public use and as a matter of law and as a matter of fact Congress had the right to do this because the dedication of this battlefield, which was the deciding battle, perhaps, of the Civil War, was a public use and was a matter that Congress certainly was authorized to hand down to posterity as a lesson.

Now, just let me for a moment call your attention to one or two paragraphs in this opinion which absolutely settle the law just exactly to the contrary of what my friend Mr. Oliver contended. Mr. Justice Peckham said:

"The really important question to be determined in this proceeding is whether the use to which the petitioner desires to put the land described in the petition is that kind of public use for which the Government of the United States is authorized to condemn land. It has authority to do so whenever it is necessary or appropriate to use the land in the execution of any of the powers granted to it by the Constitution. The question then is, is the proposed use to which the land is to be put a public use within this limitation. In these acts of Congress and in the joint resolution the intended use of this land is plainly set forth. It is stated in the second volume of Judge Dillon's work on municipal corporations that when the legislature has declared the use or purpose to be a public one, its judgment will be respected by the court unless the use be palpably without reasonable foundation."

This opinion conclusively shows that Congress can not arbitrarily declare that certain property is necessary for a public use and bind the courts by that declaration.

Why, otherwise, Mr. Chairman, no man's property would be protected: the owner of property would never have his day in court if the legislative body can, by a mere declaration of its own, take a man's property away from him without giving him a right to be heard.

After quoting Judge Dillon, Mr. Justice Peckham says:

"Many authorities are cited in the note, and indeed the rule commends itself as a rational and a proper one."

Then, going on further, he says:

"As just compensation, which is the full value of the property taken, is to be paid and the amount must be raised by taxation where the land is taken by the Government itself, there is not much ground to fear any abuse of this power. The responsibility of Congress to the people will generally, if not always, result in a most conservative exercise of the right. It is quite a different view of the question which courts will take when this power is delegated to a private corporation. In that case the presumption that the intended use for which the corporation proposes to take the land is public is not so strong as where the Government intends to use the land itself."

Now, I am perfectly confident, Mr. Chairman, that I could multiply authorities from the Supreme Court—

Mr. KEARNS (interposing). May I ask you a question there, Mr. Dent?

Mr. DENT. Certainly, Mr. Kearns.

Mr. KEARNS. Your contention is that the right of the Government to condemn land is founded on a constitutional provision and not upon a declaration of Congress?

Mr. DENT. How is that, Mr. Kearns?

Mr. KEARNS. That any right that the Government has to condemn land is granted by a constitutional provision and not by a declaration of Congress?

Mr. DENT. It arises primarily from the Constitution, but, of course, the specific right in any particular instance would require legislation by Congress to enforce the constitutional right.

Mr. KEARNS. But the declaration of Congress—

Mr. DENT (interposing). The declaration of Congress itself is not binding upon the courts. The question of whether the property is necessary for public use is a judicial and not a legislative question.

Mr. KEARNS. Your position is, then, that if Congress had the right to declare that certain lands were needed for a governmental purpose, and if that would finally settle the question, the owner of that land would not have his day in court.

Mr. DENT. No; my position is just the contrary.

Mr. KEARNS. Then I do not understand your argument.

Mr. DENT. You were not present, Mr. Kearns, when I started my statement.

Mr. WURZBACH. Mr. Dent. I think you misunderstood Mr. Kearns.

Mr. KEARNS. Your claim is that if Congress by passing a law that would declare certain lands necessary for governmental purposes could settle the question, and the courts could not go back of that declaration, then the owner of that land would not have the right to appear in court and defend his title to the land.

Mr. DENT. Yes; I understood you at first.

Mr. KEARNS. That is your position.

Mr. MCKENZIE. If you will permit me, Mr. Kearns, Mr. Dent is attempting at this time to answer the argument made by Mr. Oliver on yesterday.

Mr. KEARNS. I understand that.

Mr. MCKENZIE. And is taking the entirely opposite view of the law as stated by Mr. Oliver.

Mr. KEARNS. I understand that, too.

Mr. DENT. Mr. Kearns, let me state in my own language just what my position is.

Mr. KEARNS. Yes.

Mr. DENT. Or let me put it in this way: Mr. Oliver contends that when Congress by legislative act declares that certain property is necessary for public use, that that is final and conclusive.

Mr. KEARNS. Yes; that is his contention.

Mr. DENT. My contention is that it is not; that the owner of the land still has the right to contest that question in the courts.

Mr. KEARNS. That is what I thought to be your position.

Mr. DENT. Then I misunderstood you.

Mr. MILLER. If I understand you correctly, you contend that condemnation proceedings on behalf of the Government constitute a judicial question.

Mr. DENT. Yes, sir.

Mr. MILLER. That is Mr. Oliver's contention.

Mr. DENT. No; Mr. Oliver's contention is that it is a legislative question and mine is that it is a judicial question.

Mr. MILLER. How would you handle that practically in court? Suppose that Congress should provide for condemnation proceedings and should declare the acquisition of the Warrior steam plant a public use, do you claim that the Alabama Power Co. can come in and contest that on the ground that it is not a public use?

Mr. DENT. Certainly.

Mr. MILLER. And make it a question of fact?

Mr. DENT. Yes; that was done in the Gettysburg case; exactly.

Mr. MILLER. Then if it was a question of fact to be decided by a jury the jury would decide whether it was a public use.

Mr. DENT. No, Mr. Miller, I think it is a question of law.

Mr. MILLER. Have you any case in mind where in a condemnation proceeding on behalf of the Government the question of public necessity is a question of fact?

Mr. DENT. It is a question of law. It is a judicial question. The very case I read, the Gettysburg case, is a case in point. Of course, the law must be based on the facts.

Mr. MILLER. Then do you claim you could go into the question of facts?

Mr. DENT. As to the character of the land and the necessity?

Mr. MILLER. As to the purpose of the land?

Mr. DENT. Certainly; undoubtedly.

Mr. MILLER. Have you any cases to sustain that position?

Mr. DENT. The Gettysburg case. I think if you will read that case—

Mr. MILLER (interposing). I tried to pay very close attention to it, but I could not get that idea from it, Mr. Dent. I never personally have known of a condemnation proceeding on behalf of the Government for any governmental

use, whether for fortifications or what not where the question of governmental use was a judicial question and you could go into that and introduce testimony as to whether or not it was a public use.

Mr. DENT. Why, of course, if land were sought to be condemned for military purposes, for fortifications or for a camp—

Mr. MILLER. Or for a post office or anything else.

Mr. DENT. Or for a post-office building or anything of that kind that is settled on the face of it. You can condemn any land for that purpose; any land would be appropriate and necessary for the purposes of a thing of that kind.

Mr. MILLER. How do you distinguish between different governmental uses? Suppose here is a piece of land we want for a post office and suppose here is a piece of land we want for an electric light plant—

Mr. DENT (interposing). As I said a little while ago, any property may be used for a post-office building or any property might be utilized for fortifications if it was along the coast or in some place where fortification was necessary; but suppose that Congress should order a fortification to be put at a place where nobody would ever contend that a fortification was necessary, do you not think that question would be gone into?

Mr. MILLER. Frankly, not.

Mr. DENT. I do.

Mr. MILLER. And I was much interested in the decision you read from, but I can not get that idea from that decision that you pointed out, Mr. Dent.

Mr. DENT. Well, let us read this again. This is a quotation from Judge Dillon:

"It is stated in the second volume of Judge Dillon's work on municipal corporations that when the legislature has declared the use or purpose to be a public one, its judgment will be respected by the courts unless the use be palpably without reasonable foundation."

It is not clear from this expression that the courts can go into the question; let us, for instance, just to make an absurd illustration, suppose that Congress should declare that Niagara Falls was necessary in order for Mr. Ford to effectuate his Muscle Shoals project and should condemn the American side of Niagara Falls, do you not think the courts could go into that as an absurd proposition?

Mr. MILLER. I think your analogy is an impossible condition, because—

Mr. DENT. Of course, that makes it absurd, but it illustrates the point. At any rate, that authority, in my opinion, is in point, and I do not hesitate to say that if the committee is not satisfied with that, I am sure I can supply them with abundant authorities on the proposition.

Mr. MILLER. If you are through with that decision, will you pass it down to me?

Mr. DENT. Certainly.

Mr. STOLL. Right there, may I ask a question? Mr. Dent, who declares the national policies, the courts or the Congress?

Mr. DENT. Congress.

Mr. STOLL. Well, has not Congress declared the development of nitrates for munitions in time of peace to be a national policy?

Mr. DENT. Yes, sir; I think so, in a way.

Mr. STOLL. And did they not stipulate that it should be at Muscle Shoals?

Mr. DENT. Congress never did; no, sir. Congress never has mentioned Muscle Shoals.

Mr. STOLL. But it was under Executive order of the President, who was given authority to do that.

Mr. DENT. The President located plants there during the war.

Mr. STOLL. Under authority given by the Congress?

Mr. DENT. Yes, sir.

Mr. STOLL. And having declared that a national policy, do you think the courts can say it is not?

Mr. DENT. No, sir; I never have contended that, Mr. Stoll, at all; but in the execution of that policy Congress can not take every piece of property in the land in order to effectuate it. The owner of the property has got a right to go into court and have the court say whether his particular land is necessary in order to carry that policy into effect. That is the distinction I have tried to make.

Mr. WURZBACH. Mr. Dent, I think your position is that when there is a legislative declaration that certain property is taken for public use, that it

creates a presumption, and the burden of proof would be upon the contestant to show that it was not.

Mr. DENT. That is it absolutely.

Mr. WURZBACH. It is really a question of the burden of proof.

Mr. DENT. That is exactly what Justice Peckham says in this case.

Mr. KEARNS. Then the question of fact would enter into it?

Mr. DENT. Surely.

Mr. WURZBACH. And it must be shown that it was palpably necessary?

Mr. DENT. Palpably necessary for the governmental policy.

Mr. WURZBACH. And the legislative declaration constitutes a prima facie case?

Mr. DENT. That is it exactly. In other words, the courts will respect the declaration of Congress, but they are not bound by the declaration.

Mr. MCKENZIE. Mr. Dent, may I ask you a question right there?

Mr. DENT. Yes, sir.

Mr. MCKENZIE. I take it you are willing to concede that there is a governmental activity at Muscle Shoals.

Mr. DENT. Yes, sir.

Mr. MCKENZIE. And that it is such an activity that the Government would be warranted in condemning all necessary property at that point or adjacent thereto to carry out this public activity.

Mr. DENT. That is exactly correct.

Mr. MCKENZIE. But your further contention is that the Warrior Plant, being located so far distant from this point, can not be coupled up with the Muscle Shoals plant by any stretch of the imagination as a necessary adjunct to successfully conduct the plant at Muscle Shoals.

Mr. DENT. You have stated my position exactly correct, Mr. McKenzie.

Mr. MCKENZIE. Now, you further contend that even if Congress should pass a law asserting that it is necessary to have the Warrior Plant to successfully carry on the work at Muscle Shoals, that that act could be contested in the courts and tried out as a question of fact of whether or not it was necessary for carrying out the Government's intention?

Mr. DENT. As a question of law, I will put it, based on the facts.

Mr. MCKENZIE. Yes; as I understand, you would go into the courts and you would hear the testimony, and all that sort of thing, and then the court would decide and determine whether or not this act of Congress should be supreme or whether the decision of the court should prevail.

Mr. DENT. Yes, sir.

Mr. FIELDS. Following that question, Mr. Dent, your contention then is that if the Government, when it started nitrate plant No. 2 had attempted to condemn the property of the Alabama Power Co. at Gorgas for its use in the operation of this plant, that they would have had the right to have gone into court and contested the question of the necessity of that land for the operation of this plant.

Mr. DENT. That is right.

Mr. FIELDS. That is your contention.

Mr. DENT. Yes, sir; except I would not say that the Alabama Power Co. would have had the right to go into court because necessarily the Government must be the party plaintiff in the condemnation proceedings, and we would have been the defendant in that proceeding, and we would assert our rights.

Mr. FIELDS. And you would have your right in court.

Mr. DENT. Yes, sir.

Mr. FIELDS. Since they entered into this contract with the Government and the Government spent its money there, what would you say to the question that they waived their rights to be heard in court by letting the Government take possession of it and put its investments on it, thereby recognizing themselves the necessity of this property for the operation of the plant.

Mr. DENT. You have not got the facts straight. Mr. Fields. The Government has never been in possession of the property. We have been in possession of the property all along. We have not waived any rights, because under this contract we have the right to purchase this property from the Government at any time. We expressly reserved our rights in that particular by the contract.

Mr. FIELDS. Then, it is your contention that you reserved your rights?

Mr. DENT. The contract shows that on its face. The contention of some of the members of the committee and others is that that contract is invalid, but conceding the validity of the contract, we have reserved all our rights in the property, and have been in possession of the property all along. The Government could not get possession of that property now. It could not sue in elect-

ment for it because it has no title. The only way the Government would get it would be for Congress to pass a condemnation act, and then for the Government to proceed in the Federal courts to institute condemnation proceedings, and in that case we would assert our rights to the property.

Mr. FIELDS. Granting the validity of the contract, that is your contention: but taking it, on the other hand, and granting for argument's sake that the contract is not valid, then you would admit, I judge, that you did lose your right to be heard by allowing the Government to go ahead and put its money on that land without contesting that right.

Mr. DENT. No, Mr. Fields; but that brings on a discussion of another proposition of law. The law of the place where the land lies is the law that governs this contract, and I have not the slightest doubt in the world, under the law of Alabama, that if this contract is held invalid, then the Government has put property on our land and the property belongs to us, and the Government has lost the money it has put in there. I have not any doubt in the world about that.

Mr. GREENE. Mr. Dent, I suppose the law with respect to the condemnation of private property for Government use is clear enough and has been settled by this time?

Mr. DENT. Yes, sir.

Mr. GREENE. What do you say to the idea that might be involved in this proposition of Mr. Ford's offer, that in order to permit the Government to make a contract with a third party for some uses of his own, the Government had to resort to condemnation proceedings in order to get certain property to turn over to that third person? Is there any doctrine of the courts established about that or settled about that? I am a layman, you know, and am asking for information.

Mr. DENT. Mr. Greene, if I understand you, putting the proposition in concrete form, if Congress should accept Mr. Ford's offer, of course, Congress would have to provide some means and method of taking our property away from us and turning it over to Mr. Ford. I do not know of any way they can do that except by an act of condemnation of that property, declaring that it is necessary for this particular public use, and in that condemnation proceeding we would necessarily be the defendant, and we would assert our rights under this contract, and we would deny that this property was necessary for Mr. Ford's purposes at Muscle Shoals as a public use.

Mr. GREENE. In the last sentence you have brought up exactly the point I wanted to suggest. Is the giving of property to a private individual or corporation for their own employment such a thing as a public use?

Mr. DENT. I do not think so, as an ordinary proposition. Of course, Congress and the legislatures of the States have the right to authorize and have authorized public service and public utility corporations to exercise the right of condemnation.

Mr. GREENE. But they are quasi public corporations.

Mr. DENT. They are quasi public corporations. I do not know of any authority that would authorize a private corporation to condemn land for a man's private use; no; if that is what you are driving at.

Mr. GREENE. That would certainly be an interesting question to be determined in the courts, as to whether the Government in order to complete a contract with a man, the contract running simply to the advantage of the man in his private uses, the Government might have authority to condemn.

Mr. DENT. Yes. And all those questions, of course, we would raise if Congress should undertake to take our property away from us by a condemnation proceeding.

Mr. STOLL. Mr. Dent, did I understand you to say in response to Mr. Fields' question that under the law of Alabama where a party gives permissive use of its land for the placing of personal property on it or for the placing of improvements on it, that that party loses its rights and can not recover for the improvements made?

Mr. DENT. No, sir. I'd not say that, Mr. Stoll, not where they gave permissive authority to do it. I said if the contract—

Mr. STOLL (interposing). Did not the Alabama Power Co.—

Mr. DENT. Let me answer your question, please. I said that if the contract between the Alabama Power Co. and the Government is declared invalid and void, of no effect whatever, then the Government is in the attitude of having gone involuntarily and without our consent, and put improvements on our land, and, under the laws of Alabama, if I put improvements on your property without

any contract with you as the owner you get the benefit of my work and my improvements, and they belong to you.

Mr. STOLL. But this was all put on there before any contract was entered into.

Mr. DENT. Sure it was; most of it was.

Mr. STOLL. It must have been by permissive use. Did the Alabama Power Co. try to enjoin anybody from going on there or to stop them?

Mr. DENT. Not at all, and we are not claiming that.

Mr. STOLL. Then it must have been permissive use.

Mr. DENT. I was simply suggesting what might result if this committee and Congress should hold that this contract was absolutely void and had no force and effect whatever. In my opinion the natural consequence of that would be to give to the Alabama Power Co. all the improvements which the Government has put on that land.

Mr. STOLL. Did not the Alabama Power Co. build those improvements for the Government itself?

Mr. DENT. They did, but they did it under a contract. All the way through the correspondence it is shown, as you will recall, that the Government officials say that this contract will hereafter be put in writing. I am not quoting the exact language, but that is the substance of it. Now, as a lawyer, Mr. Stoll, I am sure you know that where parties engaged for a long period of time in negotiations and pending the negotiations there is an understanding that it is finally to be written into a contract signed by the parties, that the final execution of that contract is the final evidence and memorial of the entire transaction.

Mr. STOLL. My opinion is, Mr. Dent, you will never find any court that will give the Alabama Power Co. that property to the exclusion of the Government. Now, another question—

Mr. DENT (interposing). I do not think so, either, because I think the court is going to hold this contract valid.

Mr. STOLL. I mean even if the contract is held invalid. Now, another question, Mr. Dent, as to condemnation proceedings. The Alabama Power Co. built this transmission line and sold power or agreed to sell power, did they not, to the Government for use at Muscle Shoals in its projects there?

Mr. DENT. Yes, sir; while they were engaged in construction.

Mr. STOLL. By doing that did not the Alabama Power Co. admit that the project at Gorgas was necessary for the carrying on of the project at Muscle Shoals?

Mr. DENT. I think not, and I think that the language of the contract by which the Alabama Power Co. had the right at any time to purchase that property from the Government shows exactly the contrary intent.

Mr. STOLL. Do you think they would have built a transmission line 88 miles to furnish power that the Government did not need?

Mr. DENT. Oh, no; the Government need it, of course.

Mr. STOLL. For what purpose?

Mr. DENT. The Government also needed coal after it got its steam plant there.

Mr. STOLL. But I am speaking of the other situation. What did they need the power for?

Mr. DENT. They needed the power to light the premises and for other purposes. I do not know what all those purposes were.

Mr. STOLL. And for making nitrates, too, did they not?

Mr. DENT. No, sir; not that I know of.

Mr. STOLL. Did they not need the power for that purpose?

Mr. DENT. No; as I understand the nitrates proposition, Mr. Stoll, all the way through, every advocate of whatever process for making nitrogen from the air stated to this committee as long as I was a member of the committee that unless you had cheap water power you could not make nitrates in this country, and the water power was to be used for that purpose.

Mr. STOLL. I understand that, but the water power was not developed, and the fact that the Alabama Power Co. entered into an agreement with the Government to carry this power there showed that it was needed for some purpose by the Government in its development of Muscle Shoals.

Mr. DENT. Oh, yes; that it was needed for some purpose, unquestionably.

Mr. STOLL. Therefore, if it was needed, it would be part of the procedure to condemn it to use it, would it not?

Mr. DENT. There is where you and I widely differ, Mr. Stoll.

Mr. STOLL. Do you not think the Alabama Power Co. is estopped from now coming in and saying it was not part and parcel of it?

Mr. DENT. No, sir; there is nothing in this contract that raises any estoppel, and I challenge anyone to point to any section of the contract that raises any estoppel against the Alabama Power Co.

Mr. GARRETT. Mr. Dent, in the event Mr. Ford's proposition should be accepted and he should organize the company referred to in his proposal and that company should proceed to the construction and erection and completion of a water-power plant to develop power and to sell power to the public, would not that company be impressed with the same quasi-public service of any other public utility company?

Mr. DENT. I think so, Mr. Garrett, in so far as any property is absolutely necessary and essential to carry out the main purpose.

Mr. GARRETT. Then if that company was engaged in that character of public service, the same right of eminent domain that is vested in any other public utility concern would be vested in that company?

Mr. DENT. I think Congress could vest it.

Mr. GARRETT. I mean in the absence of any act of Congress and speaking generally. Railroads get their power of eminent domain, of course, from Congress or from the laws of the States.

Mr. DENT. Let me see if I understand you, Mr. Garrett.

Mr. GARRETT. Here is what I mean: If the company that Mr. Ford organizes operates the power plant for the purpose of selling power to the public as well as consuming it itself, would not that be a quasi-public service corporation?

Mr. DENT. Yes; I think so.

Mr. GARRETT. Then if it is a quasi-public service corporation, and that is what most of them are, Congress could enact a law vesting it with the power of eminent domain just as any other public service corporation.

Mr. DENT. I think the Federal water power act would give such a corporation the right of eminent domain.

Mr. GARRETT. But in the absence of that, inasmuch as this is kind of intertwined with a public interest to start with, and has a sort of governmental charge on it now, would not that be true as to the properties down there? Before asking any further questions, I would like to inquire if Mr. Martin has been dismissed from the stand?

Mr. MCKENZIE. He has not concluded; no, sir.

Mr. GARRETT. Then I will reserve the question I wanted to ask, to ask it of Mr. Martin.

Mr. GREENE. Mr. Dent, may I follow my former questions with this question, to make a distinction between rights which may be vested in a quasi-public corporation and the operations of the Government itself in making a contract with some purpose, would the Government be within its powers to exercise the right of eminent domain for the sake of getting property together, so that it might subsequently turn it over to a private corporation for its own uses.

Mr. DENT. I think, Mr. Greene, that perhaps the Government could exercise the right of eminent domain as to property absolutely necessary and essential in order to carry out this project at Muscle Shoals.

Mr. GREENE. The Government's own project?

Mr. DENT. Yes, sir; or if it sells the project to somebody else, I think it could authorize a public service corporation that was going to build this project and sell power to the public, authorize it to condemn lands absolutely necessary and essential to carry that project into effect.

Mr. GREENE. In other words, as to the property it is to turn over to some private corporation, it might exercise its own right of eminent domain to gather that property together.

Mr. DENT. I rather think it could do that.

Mr. QUIN. Mr. Dent, reverting back to the question of the delegation of authority, the act of July, 1918, gives from the Congress certain powers to the heads of departments, as I understand it.

Mr. DENT. Yes.

Mr. QUIN. Then, the power that was vested in the Congress had to be delegated through that act to some one, and they delegated it to the head of the department and in this instance, the Secretary of War, of course, was intended. What is the difference between that act and a private party giving a power of attorney to some agency or to some party to act for the principal?

Mr. DENT. In legal effect, I do not see any difference.

which \$17,000,000 have been expended. That makes \$34,200,392, at war cost. If you deduct 40 per cent, which I spoke about yesterday, for war-time discounts, that will leave \$20,401,434 worth of property as a going value, would it not?

Mr. MARTIN. You are coming down to what you say is the reproduction cost.

Mr. McKENZIE. Yes. Taking off 40 per cent from the whole cost.

Mr. MARTIN. Assuming that the entire development could have been produced for 60 per cent up to date, that it would require 60 per cent of the original cost to produce the power development—I have not compared your figures.

Mr. McKENZIE. You are buying this property as a going property. The steam plant is certainly in condition to be operated.

Mr. MARTIN. It is now; yes.

Mr. McKENZIE. The Government's addition to your own plant is in good condition?

Mr. MARTIN. Of course, the water-power development, in so far as it has progressed is not going; it is just standing idle until it is completed.

Mr. McKENZIE. I am speaking of these plants.

Mr. MARTIN. Yes. The plants—

Mr. McKENZIE (interposing). Then you would get the advantage of the \$17,000,000 expended on the dam.

Mr. MARTIN. That is quite true.

Mr. McKENZIE. Then, that would make \$20,401,434 of what we might consider as actual, fair value, would it not? We could consider it in that way, could we not?

Mr. MARTIN. We will assume that for the purpose of your question.

Mr. McKENZIE. For that you offer to pay the Government \$5,000,000, less whatever it may cost to build the locks at Dam No. 2, which you want to deduct from the \$5,000,000, as I understand it. If I am wrong, I want to be corrected on that.

Mr. MARTIN. And then the 100,000 horsepower.

Mr. McKENZIE. I understand; I will come to that in a moment. But for the \$20,401,434 worth of property, as a fair value, you propose to give the Government \$5,000,000, and then you propose to deduct from the \$5,000,000 whatever the lock may cost; and the Army engineers, as I understand it, estimate the cost of that lock to be \$4,500,000.

Mr. MARTIN. No; my understanding is that the Secretary of War estimates it to be \$2,500,000.

Mr. McKENZIE. That is the Secretary of War's statement, but the engineers have estimated the cost of the lock as \$4,500,000.

Mr. MARTIN. I have not seen any such figures, and I believe you find the figures of \$4,500,000 include the locks at two developments.

Mr. McKENZIE. I will not stop to argue that now.

Mr. FIELDS. Col. Cooper stated that.

Mr. MARTIN. I am not prepared to say it would not cost that at the two developments, at Locks 2 and 3, but I think you will find that the cost of the locks at Dam No. 2 would be \$2,500,000.

Mr. McKENZIE. In case it should cost \$4,500,000, then you would pay to the Government the sum of \$500,000.

Mr. MARTIN. No; we pay this actual money that goes into the locks. But, of course, whether the locks cost \$2,000,000 or \$3,000,000 or \$4,000,000, we propose to pay \$5,000,000 to the Government.

Mr. McKENZIE. If I read your proposition correctly, you deduct that amount.

Mr. MARTIN. That is in effect the payment to the Government, though.

Mr. McKENZIE. Now, then, in addition to that, you propose to give to the Government what else?

Mr. MARTIN. 100,000 horsepower.

Mr. McKENZIE. Secondary horsepower?

Mr. MARTIN. Well, 100,000 secondary horsepower and power for the operation of the locks, and to maintain and operate the dam, the gates, and the powerhouse during the license period.

Mr. McKENZIE. And to furnish power necessary to do that?

Mr. MARTIN. For operating the locks, yes. That is quite incidental, or quite small, but those are considerations which are also involved.

Mr. McKENZIE. What do you say the primary power is at Dam No. 1?

Mr. MARTIN. You mean Dam No. 2?

Mr. McKENZIE. Yes; Dam No. 2.

Mr. DENT. But my contention is that you can not go 88 miles away from there and condemn property belonging to somebody else, which is not absolutely necessary and essential to carry that project into effect. In other words, to illustrate, the Government has a steam plant down there. It built this steam plant in connection with its nitrate plant. I suppose, for the purpose of utilizing it when the water was low and they could not get water power. The Government needs coal for that purpose. It made a contract with the Montevallo Coal Co., way down in Shelby County, south of Birmingham, to furnish coal for it, just like it made a contract with us to furnish power. You would not contend that because coal is necessary to operate that plant the Government could go down in Shelby County and condemn the mines of the Montevallo Coal Co.? Now, that illustrates the proposition, as I understand it.

Mr. GREENE. Will you permit just one more question? In the exercise of its right of eminent domain for the purpose of carrying out its contract would not the Government be confined to those parts of the contract that were manifestly a public use?

Mr. DENT. Exactly.

Mr. GREENE. That is, they could not go outside and condemn other bits of property to turn over to Mr. Ford that related to that part of the plant that he wanted to use for the manufacture of automobile parts?

Mr. DENT. No, sir; not at all.

So much, Mr. Chairman, for that proposition. At any rate, I have given the committee the benefit of my judgment and my opinion on this proposition, and as I have said, if the committee wishes other and additional authorities I am satisfied I can multiply them many times.

Now, Mr. Oliver further contends that the right to sell property acquired during the war under the act of July 9, 1918, does not carry with it the right to postpone the date of the sale, and he refers particularly to that clause of the contract which provides that the Government's right to sell the property to the Alabama Power Co. must not be exercised within the period of three years, and he further contends that the power to sell does not carry with it the power to arbitrate the price.

All I have to say, Mr. Chairman, in reply to that is that whenever any party is given the absolute right to sell property it necessarily carries with it every incidental and implied power that is necessary to effectuate the general purpose of the authority. In other words, the power to sell carries with it the lesser power to make a contract for a sale. It necessarily carries with it the power to fix the terms of the sale. It necessarily carries with it the time when the sale shall take place. All of those things are mere incidents of a general power. That is Hornbook law, Mr. Chairman. I can not understand how any lawyer can contend that the absolute and unequivocal right to sell property does not carry with it the implied and incidental power to do anything that is necessary to carry into effect the contract of sale.

Mr. McKENZIE. May I ask you a question right there which is not exactly in point, but I would like to know your view if you have not already expressed it? Do you hold that the property placed on the land of the Alabama Power Co., including the transmission line, is in the nature of personal property rather than real property?

Mr. DENT. Mr. McKenzie, my position is this: That if the contract between the Alabama Power Co. and the Government is a valid contract, then that property is in the nature of personal property; but if the contract is declared to be void, then the Government would be in the attitude of having gone upon our land without any authority or without any agreement whatever with us and erected improvements, and those improvements under the law would naturally go with the title and the ownership of the land.

Mr. McKENZIE. My reason for asking you that question is to ask you another one. It is upon that view that you made the statement that the laws of May and July, 1918, covering the sale of personal property belonging to the Government was applicable to this property.

Mr. DENT. Yes, sir.

Mr. McKENZIE. And that the law of 1892, I think it was, covering the sale of real estate and the leasing of real estate by the War Department, does not apply to this character of property?

Mr. DENT. I do not know that I have read that law of 1892 very recently.

Mr. McKENZIE. It was put in at the beginning of the hearings, and provides that the Government or the War Department can only lease for a term of five years.

Mr. DENT. Yes; at any rate, you have my view, whatever it is worth; and Mr. Weathers calls my attention to the fact that the act of July 9 includes real estate as well as personal property. I believe it does say plants.

Mr. McKENZIE. But under the contract the former statutes, it seems to me, would apply, but that is a matter not to be taken up at this time.

Mr. DENT. Now, the same principle I have just asserted, it seems to me, applies to the right to arbitrate. Wherever parties enter into a contract involving the sale and purchase of property it is common, and it is an ordinary feature of such a contract that if they can not agree upon the terms, that they shall be fixed by arbitration. The law itself favors such contracts. The law favors arbitration as a means of settling differences between parties rather than resorting to the machinery of the courts, and, necessarily, if the price of the property is involved, some method of fixing that price and of ascertaining that price is an incidental power to the right to sell. Therefore, I say the right to fix this price by means of arbitration necessarily follows the absolute power to sell the property.

Mr. McKENZIE. Your contention is based on the peculiar character of the property in this case, is it not, Mr. Dent? You would not contend that the Government should provide for arbitration to sell a piece of property that was not involved with some one else's property, would you?

Mr. DENT. Oh, no; not at all. I am addressing myself, Mr. McKENZIE, of course, to this particular transaction.

Mr. McKENZIE. Having in mind the situation on the Warrior River.

Mr. DENT. Surely. Let me call attention to that arbitration clause to show how fair it is. Mr. Oliver seems to think it is a horrible proposition that the Alabama Power Co. has the right to name an arbitrator. He seems to take the position that it is a queer provision in the contract that one of the parties to the contract has the right to name his arbitrator. Why, that is done every day in the world in this land. Whenever arbitration contracts are made, this is the form they take and each party names his own arbitrator, and if they can not agree the two select a third. The arbitration provision in this contract goes further and states that if the two arbitrators, selected on the one hand by the power company and on the other by the Government, can not agree upon the third man, then the presiding judge of the Court of Appeals of the Fifth Circuit of the United States shall select the third man. Nothing could be fairer than that in providing the ways and means of fixing the fair price that the Alabama Power Co. should pay the Government for this property.

Mr. GARRETT. The general law of arbitration, in selecting arbitrators, would require that they should be disinterested parties.

Mr. DENT. Yes.

Mr. GARRETT. And not anybody who was interested, either a Government official or a person interested in the Alabama Power Co.

Mr. DENT. They should be disinterested parties, certainly.

Mr. GARRETT. I would like to submit this question in regard to the matter of the contract referred to by Mr. Dent. In the event this contract should fail, what do you say to this proposition, Mr. Dent: Suppose this contract has failed of execution, instead of being executed on the 7th day of November, nearly a year after the operations had begun it, and, as a matter of fact, had never been executed, and that at the signing of the armistice the Government of the United States had owed the Alabama Power Co. \$250,000 as a balance due on construction, on its fee for constructing. On what would they recover? What would be the status in that case?

Mr. DENT. They could not recover.

Mr. GARRETT. They would have no claim against the Government?

Mr. DENT. No legal claim.

Mr. GARRETT. Because there was no contract?

Mr. DENT. Because there was no contract; yes.

Mr. GARRETT. Do you not think they would have a right to recover on quantum meruit?

Mr. DENT. Not against the Government. If the contract had been a contract between individuals, they would have, but not against the Government.

Mr. GARRETT. When they went ahead and did this work upon an understanding with the officials of the Government, by letters and telegrams and

Mr. DENT. But my contention is that you can not go 88 miles away from there and condemn property belonging to somebody else, which is not absolutely necessary and essential to carry that project into effect. In other words, to illustrate, the Government has a steam plant down there. It built this steam plant in connection with its nitrate plant, I suppose, for the purpose of utilizing it when the water was low and they could not get water power. The Government needs coal for that purpose. It made a contract with the Montevallo Coal Co., way down in Shelby County, south of Birmingham, to furnish coal for it, just like it made a contract with us to furnish power. You would not contend that because coal is necessary to operate that plant the Government could go down in Shelby County and condemn the mines of the Montevallo Coal Co.? Now, that illustrates the proposition, as I understand it.

Mr. GREENE. Will you permit just one more question? In the exercise of its right of eminent domain for the purpose of carrying out its contract would not the Government be confined to those parts of the contract that were manifestly a public use?

Mr. DENT. Exactly.

Mr. GREENE. That is, they could not go outside and condemn other bits of property to turn over to Mr. Ford that related to that part of the plant that he wanted to use for the manufacture of automobile parts?

Mr. DENT. No, sir; not at all.

So much, Mr. Chairman, for that proposition. At any rate, I have given the committee the benefit of my judgment and my opinion on this proposition, and as I have said, if the committee wishes other and additional authorities I am satisfied I can multiply them many times.

Now, Mr. Oliver further contends that the right to sell property acquired during the war under the act of July 9, 1918, does not carry with it the right to postpone the date of the sale, and he refers particularly to that clause of the contract which provides that the Government's right to sell the property to the Alabama Power Co. must not be exercised within the period of three years, and he further contends that the power to sell does not carry with it the power to arbitrate the price.

All I have to say, Mr. Chairman, in reply to that is that whenever any party is given the absolute right to sell property it necessarily carries with it every incidental and implied power that is necessary to effectuate the general purpose of the authority. In other words, the power to sell carries with it the lesser power to make a contract for a sale. It necessarily carries with it the power to fix the terms of the sale. The law itself favors such contracts. The law favors arbitration as a means of settling differences between parties rather than resorting to the machinery of the courts, and, necessarily, if the price of the property is involved, some method of fixing that price and of ascertaining that price is an incidental power to the right to sell. Therefore, I say the right to fix this price by means of arbitration necessarily follows the absolute power to sell the property.

Mr. McKENZIE. Your contention is based on the peculiar character of the property in this case, is it not, Mr. Dent? You would not contend that the Government should provide for arbitration to sell a piece of property that was not involved with some one else's property, would you?

Mr. DENT. Oh, no; not at all. I am addressing myself, Mr. McKenzie, of course, to this particular transaction.

Mr. McKENZIE. Having in mind the situation on the Warrior River.

Mr. DENT. Surely. Let me call attention to that arbitration clause to show how fair it is. Mr. Oliver seems to think it is a horrible proposition that the Alabama Power Co. has the right to name an arbitrator. He seems to take the position that it is a queer provision in the contract that one of the parties to the contract has the right to name his arbitrator. Why, that is done every day in the world in this land. Whenever arbitration contracts are made, this is the form they take and each party names his own arbitrator, and if they can not agree the two select a third. The arbitration provision in this contract goes further and states that if the two arbitrators, selected on the one hand by the power company and on the other by the Government, can not agree upon the third man, then the presiding judge of the Court of Appeals of the Fifth Circuit of the United States shall select the third man. Nothing could be fairer than that in providing the ways and means of fixing the fair price that the Alabama Power Co. should pay the Government for this property.

Mr. GARRETT. The general law of arbitration, in selecting arbitrators, would require that they should be disinterested parties.

Mr. DENT. Yes.

Mr. GARRETT. And not anybody who was interested, either a Government official or a person interested in the Alabama Power Co.

Mr. DENT. They should be disinterested parties, certainly.

Mr. GARRETT. I would like to submit this question in regard to the matter of the contract referred to by Mr. Dent. In the event this contract should fail, what do you say to this proposition. Mr. Dent: Suppose this contract has failed of execution, instead of being executed on the 7th day of November, nearly a year after the operations had begun it, and, as a matter of fact, had never been executed, and that at the signing of the armistice the Government of the United States had owed the Alabama Power Co. \$250,000 as a balance due on construction, on its fee for constructing. On what would they recover? What would be the status in that case?

Mr. DENT. They could not recover.

Mr. GARRETT. They would have no claim against the Government?

Mr. DENT. No legal claim.

Mr. GARRETT. Because there was no contract?

Mr. DENT. Because there was no contract; yes.

Mr. GARRETT. Do you not think they would have a right to recover on quantum meruit?

Mr. DENT. Not against the Government. If the contract had been a contract between individuals, they would have, but not against the Government.

Mr. GARRETT. When they went ahead and did this work upon an understanding with the Government, by letters and telegrams and

Mr. DENT. But my contention is that you can not go 88 miles away from there and condemn property belonging to somebody else, which is not absolutely necessary and essential to carry that project into effect. In other words, to illustrate, the Government has a steam plant down there. It built this steam plant in connection with its nitrate plant, I suppose, for the purpose of utilizing it when the water was low and they could not get water power. The Government needs coal for that purpose. It made a contract with the Montevallo Coal Co., way down in Shelby County, south of Birmingham, to furnish coal for it, just like it made a contract with us to furnish power. You would not contend that because coal is necessary to operate that plant the Government could go down in Shelby County and condemn the mines of the Montevallo Coal Co.? Now, that illustrates the proposition, as I understand it.

Mr. GREENE. Will you permit just one more question? In the exercise of its right of eminent domain for the purpose of carrying out its contract would not the Government be confined to those parts of the contract that were manifestly a public use?

Mr. DENT. Exactly.

Mr. GREENE. That is, they could not go outside and condemn other bits of property to turn over to Mr. Ford that related to that part of the plant that he wanted to use for the manufacture of automobile parts?

Mr. DENT. No, sir; not at all.

So much, Mr. Chairman, for that proposition. At any rate, I have given the committee the benefit of my judgment and my opinion on this proposition, and as I have said, if the committee wishes other and additional authorities I am satisfied I can multiply them many times.

Now, Mr. Oliver further contends that the right to sell property acquired during the war under the act of July 9, 1918, does not carry with it the right to postpone the date of the sale, and he refers particularly to that clause of the contract which provides that the Government's right to sell the property to the Alabama Power Co. must not be exercised within the period of three years, and he further contends that the power to sell does not carry with it the power to arbitrate the price.

All I have to say, Mr. Chairman, in reply to that is that whenever any party is given the absolute right to sell property it necessarily carries with it every incidental and implied power that is necessary to effectuate the general purpose of the authority. In other words, the power to sell carries with it the lesser power to make a contract for a sale. It necessarily carries with it the power to fix the terms of the sale. It necessarily carries with it the time when the sale shall take place. All of those things are mere incidents of a general power. That is Hornbook law, Mr. Chairman. I can not understand how any lawyer can contend that the absolute and unequivocal right to sell property does not carry with it the implied and incidental power to do anything that is necessary to carry into effect the contract of sale.

Mr. McKENZIE. May I ask you a question right there which is not exactly in point, but I would like to know your view if you have not already expressed it? Do you hold that the property placed on the land of the Alabama Power Co., including the transmission line, is in the nature of personal property rather than real property?

Mr. DENT. Mr. McKenzie, my position is this: That if the contract between the Alabama Power Co. and the Government is a valid contract, then that property is in the nature of personal property; but if the contract is declared to be void, then the Government would be in the attitude of having gone upon our land without any authority or without any agreement whatever with us and erected improvements, and those improvements under the law would naturally go with the title and the ownership of the land.

Mr. McKENZIE. My reason for asking you that question is to ask you another one. It is upon that view that you made the statement that the laws of May and July, 1918, covering the sale of personal property belonging to the Government was applicable to this property.

Mr. DENT. Yes, sir.

Mr. McKENZIE. And that the law of 1892, I think it was, covering the sale of real estate and the leasing of real estate by the War Department, does not apply to this character of property?

Mr. DENT. I do not know that I have read that law of 1892 very recently.

Mr. McKENZIE. It was put in at the beginning of the hearings, and provides that the Government or the War Department can only lease for a term of five years.

Mr. DENT. Yes; at any rate, you have my view, whatever it is worth; and Mr. Weathers calls my attention to the fact that the act of July 9 includes real estate as well as personal property. I believe it does say plants.

Mr. McKENZIE. But under the contract the former statutes, it seems to me, would apply, but that is a matter not to be taken up at this time.

Mr. DENT. Now, the same principle I have just asserted, it seems to me, applies to the right to arbitrate. Wherever parties enter into a contract involving the sale and purchase of property it is common, and it is an ordinary feature of such a contract that if they can not agree upon the terms, that they shall be fixed by arbitration. The law itself favors such contracts. The law favors arbitration as a means of settling differences between parties rather than resorting to the machinery of the courts, and, necessarily, if the price of the property is involved, some method of fixing that price and of ascertaining that price is an incidental power to the right to sell. Therefore, I say the right to fix this price by means of arbitration necessarily follows the absolute power to sell the property.

Mr. McKENZIE. Your contention is based on the peculiar character of the property in this case, is it not, Mr. Dent? You would not contend that the Government should provide for arbitration to sell a piece of property that was not involved with some one else's property, would you?

Mr. DENT. Oh, no; not at all. I am addressing myself, Mr. McKenzie, of course, to this particular transaction.

Mr. McKENZIE. Having in mind the situation on the Warrior River.

Mr. DENT. Surely. Let me call attention to that arbitration clause to show how fair it is. Mr. Oliver seems to think it is a horrible proposition that the Alabama Power Co. has the right to name an arbitrator. He seems to take the position that it is a queer provision in the contract that one of the parties to the contract has the right to name his arbitrator. Why, that is done every day in the world in this land. Whenever arbitration contracts are made, this is the form they take and each party names his own arbitrator, and if they can not agree the two select a third. The arbitration provision in this contract goes further and states that if the two arbitrators, selected on the one hand by the power company and on the other by the Government, can not agree upon the third man, then the presiding judge of the Court of Appeals of the Fifth Circuit of the United States shall select the third man. Nothing could be fairer than that in providing the ways and means of fixing the fair price that the Alabama Power Co. should pay the Government for this property.

Mr. GARRETT. The general law of arbitration, in selecting arbitrators, would require that they should be disinterested parties.

Mr. DENT. Yes.

Mr. GARRETT. And not anybody who was interested, either a Government official or a person interested in the Alabama Power Co.

Mr. DENT. They should be disinterested parties, certainly.

Mr. GARRETT. I would like to submit this question in regard to the matter of the contract referred to by Mr. Dent. In the event this contract should fail, what do you say to this proposition, Mr. Dent: Suppose this contract has failed of execution, instead of being executed on the 7th day of November, nearly a year after the operations had begun it, and, as a matter of fact, had never been executed, and that at the signing of the armistice the Government of the United States had owed the Alabama Power Co. \$250,000 as a balance due on construction, on its fee for constructing. On what would they recover? What would be the status in that case?

Mr. DENT. They could not recover.

Mr. GARRETT. They would have no claim against the Government?

Mr. DENT. No legal claim.

Mr. GARRETT. Because there was no contract?

Mr. DENT. Because there was no contract; yes.

Mr. GARRETT. Do you not think they would have a right to recover on quantum meruit?

Mr. DENT. Not against the Government. If the contract had been a contract between individuals, they would have, but not against the Government.

Mr. GARRETT. When they went ahead and did this work upon an understanding with the officials of the Government, by letters and telegrams and

Mr. DENT. But my contention is that you can not go 88 miles away from there and condemn property belonging to somebody else, which is not absolutely necessary and essential to carry that project into effect. In other words, to illustrate, the Government has a steam plant down there. It built this steam plant in connection with its nitrate plant, I suppose, for the purpose of utilizing it when the water was low and they could not get water power. The Government needs coal for that purpose. It made a contract with the Montevallo Coal Co., way down in Shelby County, south of Birmingham, to furnish coal for it, just like it made a contract with us to furnish power. You would not contend that because coal is necessary to operate that plant the Government could go down in Shelby County and condemn the mines of the Montevallo Coal Co.? Now, that illustrates the proposition, as I understand it.

Mr. GREENE. Will you permit just one more question? In the exercise of its right of eminent domain for the purpose of carrying out its contract would not the Government be confined to those parts of the contract that were manifestly a public use?

Mr. DENT. Exactly.

Mr. GREENE. That is, they could not go outside and condemn other bits of property to turn over to Mr. Ford that related to that part of the plant that he wanted to use for the manufacture of automobile parts?

Mr. DENT. No, sir; not at all.

So much, Mr. Chairman, for that proposition. At any rate, I have given the committee the benefit of my judgment and my opinion on this proposition, and as I have said, if the committee wishes other and additional authorities I am satisfied I can multiply them many times.

Now, Mr. Oliver further contends that the right to sell property acquired during the war under the act of July 9, 1918, does not carry with it the right to postpone the date of the sale, and he refers particularly to that clause of the contract which provides that the Government's right to sell the property to the Alabama Power Co. must not be exercised within the period of three years, and he further contends that the power to sell does not carry with it the power to arbitrate the price.

All I have to say, Mr. Chairman, in reply to that is that whenever any party is given the absolute right to sell property it necessarily carries with it every incidental and implied power that is necessary to effectuate the general purpose of the authority. In other words, the power to sell carries with it the lesser power to make a contract for a sale. It necessarily carries with it the power to fix the terms of the sale. It necessarily carries with it the time when the sale shall take place. All of those things are mere incidents of a general power. That is Hornbook law, Mr. Chairman. I can not understand how any lawyer can contend that the absolute and unequivocal right to sell property does not carry with it the implied and incidental power to do anything that is necessary to carry into effect the contract of sale.

Mr. McKENZIE. May I ask you a question right there which is not exactly in point, but I would like to know your view if you have not already expressed it? Do you hold that the property placed on the land of the Alabama Power Co., including the transmission line, is in the nature of personal property rather than real property?

Mr. DENT. Mr. McKenzie, my position is this: That if the contract between the Alabama Power Co. and the Government is a valid contract, then that property is in the nature of personal property; but if the contract is declared to be void, then the Government would be in the attitude of having gone upon our land without any authority or without any agreement whatever with us and erected improvements, and those improvements under the law would naturally go with the title and the ownership of the land.

Mr. McKENZIE. My reason for asking you that question is to ask you another one. It is upon that view that you made the statement that the laws of March and July, 1918, covering the sale of personal property belonging to the Government was applicable to this property.

Mr. DENT. Yes, sir.

Mr. McKENZIE. And that the law of 1892, I think it was, of real estate and the leasing of real estate by the Government applies to this character of property?

Mr. DENT. I do not know that I have read that.

Well, I will not take issue with him on that proposition, and if the committee takes that view of the matter we would ask the further indulgence of the committee to introduce the testimony of Maj. Booten, of the Ordnance Department, who has the records of that department in reference to Ordnance contracts. I interviewed Maj. Booten yesterday afternoon at his office and saw the records, and his testimony will disclose that the Secretary of War authorized Maj. Gen. Williams, Chief of Ordnance, to make contracts in his department in the name of the Secretary and to nominate officers in his department as contracting officers, and that Lieut. Col. William Williams, who signed this contract, was one of the contracting officers named by Maj. Gen. Williams, Chief of Ordnance. I understand that Maj. Booten is ready to come before the committee with these records at any time that suits the convenience of the committee. So the facts that will be disclosed by Maj. Booten's testimony will completely cover the argument of Mr. Oliver that the head of the department means the Cabinet officer.

Mr. MCKENZIE. If I understand you, it is your contention that one of the heads of departments, such as a Cabinet officer, would have the power under the law to redelegate authority delegated to him by Congress?

Mr. DENT. Surely.

Mr. MCKENZIE. In a matter of this kind?

Mr. DENT. Yes; in view of the language of the act, which does not say it must be done by the head of the department, but through the heads of the departments, and that otherwise any other construction would render the act impractical, because it would have been a matter of physical impossibility for the Secretary of War himself to have signed every war contract that was made. That would have been absurd on its face.

Now, so much for that proposition, which will be answered, as I stated, by the facts.

Mr. FISHER. I would like to ask you a question before you branch off from that point.

Mr. DENT. All right, Mr. Fisher.

Mr. FISHER. I would like to know who was the lawyer for the Alabama Power Co. through all these proceedings leading up to the signing of the contract on the day of the fake announcement of the armistice. We had testimony from the Air Nitrates Corporation that the lawyer representing them—who is now dead—reached the conclusion that they could not take an option; that it would be illegal to take an option from the Government to sell after the war; and that they consulted other counsel, but that that counsel was now out of the city, and I would like to know whether or not there was a law firm or any other lawyer, other than Mr. Martin himself, who was negotiating for the Alabama Power Co. in drafting the terms of the contract.

Mr. DENT. Of course, I could not answer that myself, Mr. Fisher, personally, because I was not connected with the Alabama Power Co. at that time, but Mr. Martin can.

Mr. FISHER. Then I will ask Mr. Martin when he goes on.

Mr. DENT. As I understand Mr. Oliver's argument, he contends that when Congress by legislative action declares that certain property is necessary for a public use, that that is binding upon the courts and that the courts can not go behind that declaration of Congress. That is his first and his main proposition. Second, that the head of a department must be a Cabinet officer, which I have already answered. Third, that the right to sell does not include the right to postpone the date of the sale or to agree to arbitration. Fourth, that the act of July 9, 1918, does not apply to property to be used subsequent to the war, whatever that means. And fifth, that the proviso to the act of July 9, 1918, which he quotes in his remarks, expired by its own limitation a few months after the passage of the act, by reason of the fact that the Secretary of War was required to make a report to Congress.

I believe that those are the main and principal propositions that my friend, Mr. Oliver, asserted before the committee on yesterday.

It is rather difficult, Mr. Chairman, and I consider it absolutely unnecessary, to go into any extended argument before this committee on the right of Congress to declare certain property necessary and essential for public use and bind the courts. The fact is I have not had a chance to run down the authorities myself, but even if I had them I would not weary this committee with a long

Mr. DENT. But my contention is that you can not go 88 miles away from there and condemn property belonging to somebody else, which is not absolutely necessary and essential to carry that project into effect. In other words, to illustrate, the Government has a steam plant down there. It built this steam plant in connection with its nitrate plant, I suppose, for the purpose of utilizing it when the water was low and they could not get water power. The Government needs coal for that purpose. It made a contract with the Montevallo Coal Co., way down in Shelby County, south of Birmingham, to furnish coal for it, just like it made a contract with us to furnish power. You would not contend that because coal is necessary to operate that plant the Government could go down in Shelby County and condemn the mines of the Montevallo Coal Co.? Now, that illustrates the proposition, as I understand it.

Mr. GREENE. Will you permit just one more question? In the exercise of its right of eminent domain for the purpose of carrying out its contract would not the Government be confined to those parts of the contract that were manifestly a public use?

Mr. DENT. Exactly.

Mr. GREENE. That is, they could not go outside and condemn other bits of property to turn over to Mr. Ford that related to that part of the plant that he wanted to use for the manufacture of automobile parts?

Mr. DENT. No, sir; not at all.

So much, Mr. Chairman, for that proposition. At any rate, I have given the committee the benefit of my judgment and my opinion on this proposition, and as I have said, if the committee wishes other and additional authorities I am satisfied I can multiply them many times.

Now, Mr. Oliver further contends that the right to sell property acquired during the war under the act of July 9, 1918, does not carry with it the right to postpone the date of the sale, and he refers particularly to that clause of the contract which provides that the Government's right to sell the property to the Alabama Power Co. must not be exercised within the period of three years, and he further contends that the power to sell does not carry with it the power to arbitrate the price.

All I have to say, Mr. Chairman, in reply to that is that whenever any party is given the absolute right to sell property it necessarily carries with it every incidental and implied power that is necessary to effectuate the general purpose of the authority. In other words, the power to sell carries with it the lesser power to make a contract for a sale. It necessarily carries with it the power to fix the terms of the sale. It necessarily carries with it the time when the sale shall take place. All of those things are mere incidents of a general power. That is Hornbook law, Mr. Chairman. I can not understand how any lawyer can contend that the absolute and unequivocal right to sell property does not carry with it the implied and incidental power to do anything that is necessary to carry into effect the contract of sale.

Mr. McKENZIE. May I ask you a question right there which is not exactly in point, but I would like to know your view if you have not already expressed it? Do you hold that the property placed on the land of the Alabama Power Co., including the transmission line, is in the nature of personal property rather than real property?

Mr. DENT. Mr. McKenzie, my position is this: That if the contract between the Alabama Power Co. and the Government is a valid contract, then that property is in the nature of personal property; but if the contract is declared to be void, then the Government would be in the attitude of having gone upon our land without any authority or without any agreement whatever with us and erected improvements, and those improvements under the law would naturally go with the title and the ownership of the land.

Mr. McKENZIE. My reason for asking you that question is to ask you another one. It is upon that view that you made the statement that the laws of May and July, 1918, covering the sale of personal property belonging to the Government was applicable to this property.

Mr. DENT. Yes, sir.

Mr. McKENZIE. And that the law of 1892, I think it was, covering the sale of real estate and the leasing of real estate by the War Department, does not apply to this character of property?

Mr. DENT. I do not know that I have read that law of 1892 very recently.

Mr. McKENZIE. It was put in at the beginning of the hearings, and provides that the Government or the War Department can only lease for a term of five years.

Mr. DENT. Yes; at any rate, you have my view, whatever it is worth; and Mr. Weathers calls my attention to the fact that the act of July 9 includes real estate as well as personal property. I believe it does say plants.

Mr. McKENZIE. But under the contract the former statutes, it seems to me, would apply, but that is a matter not to be taken up at this time.

Mr. DENT. Now, the same principle I have just asserted, it seems to me, applies to the right to arbitrate. Whenever parties enter into a contract involving the sale and purchase of property it is common, and it is an ordinary feature of such a contract that if they can not agree upon the terms, that they shall be fixed by arbitration. The law itself favors such contracts. The law favors arbitration as a means of settling differences between parties rather than resorting to the machinery of the courts, and, necessarily, if the price of the property is involved, some method of fixing that price and of ascertaining that price is an incidental power to the right to sell. Therefore, I say the right to fix this price by means of arbitration necessarily follows the absolute power to sell the property.

Mr. McKENZIE. Your contention is based on the peculiar character of the property in this case, is it not, Mr. Dent? You would not contend that the Government should provide for arbitration to sell a piece of property that was not involved with some one else's property, would you?

Mr. DENT. Oh, no; not at all. I am addressing myself, Mr. McKENZIE, of course, to this particular transaction.

Mr. McKENZIE. Having in mind the situation on the Warrior River.

Mr. DENT. Surely. Let me call attention to that arbitration clause to show how fair it is. Mr. Oliver seems to think it is a horrible proposition that the Alabama Power Co. has the right to name an arbitrator. He seems to take the position that it is a queer provision in the contract that one of the parties to the contract has the right to name his arbitrator. Why, that is done every day in the world in this land. Whenever arbitration contracts are made, this is the form they take and each party names his own arbitrator, and if they can not agree the two select a third. The arbitration provision in this contract goes further and states that if the two arbitrators, selected on the one hand by the power company and on the other by the Government, can not agree upon the third man, then the presiding judge of the Court of Appeals of the Fifth Circuit of the United States shall select the third man. Nothing could be fairer than that in providing the ways and means of fixing the fair price that the Alabama Power Co. should pay the Government for this property.

Mr. GARRETT. The general law of arbitration, in selecting arbitrators, would require that they should be disinterested parties.

Mr. DENT. Yes.

Mr. GARRETT. And not anybody who was interested, either a Government official or a person interested in the Alabama Power Co.

Mr. DENT. They should be disinterested parties, certainly.

Mr. GARRETT. I would like to submit this question in regard to the matter of the contract referred to by Mr. Dent. In the event this contract should fail, what do you say to this proposition, Mr. Dent: Suppose this contract has failed of execution, instead of being executed on the 7th day of November, nearly a year after the operations had begun it, and, as a matter of fact, had never been executed, and that at the signing of the armistice the Government of the United States had owed the Alabama Power Co. \$250,000 as a balance due on construction, on its fee for constructing. On what would they recover? What would be the status in that case?

Mr. DENT. They could not recover.

Mr. GARRETT. They would have no claim against the Government?

Mr. DENT. No legal claim.

Mr. GARRETT. Because there was no contract?

Mr. DENT. Because there was no contract; yes.

Mr. GARRETT. Do you not think they would have a right to recover on quantum meruit?

Mr. DENT. Not against the Government. If the contract had been a contract between individuals, they would have, but not against the Government.

Mr. GARRETT. When they went ahead and did this work upon an understanding with the officials of the Government, by letters and telegrams and

memoranda submitted to them, and they did perform it, although no contract was ever executed, would not the Alabama Power Co. have any recourse against the Government, in the event the Government should owe the company a fee?

Mr. DENT. I do not think so, as against the Government itself. That was the opinion of the Comptroller of the Treasury, and the opinion of this committee, and the opinion of Congress which resulted in the passage of the so-called Dent Act. That act was passed for the very purpose of taking care of contracts that had not been executed in accordance with the terms prescribed by the statute.

Mr. GARRETT. Then I understand your position to be that if this contract failed, there is no contractual relationship existing between the Alabama Power Co. and the United States for any purpose?

Mr. DENT. Yes, sir; that is my position.

Mr. GARRETT. And that although the Alabama Power Co., representing the Government, did, as a matter of fact, take Government funds and construct this property upon its real estate, and receive compensation for constructing it upon its real estate, a good fee, and all of the funds necessary for the completion of the work were furnished by the Government, still, that they could be heard to-day that they had not consented to this property being constructed upon their real estate, when they did it with their own hands?

Mr. DENT. In the first place, Mr. Garrett, the Alabama Power Co. never received any money from the Government. The Government disbursed its own funds on its construction work down there by its own disbursing officer.

Mr. GARRETT. Who did this work?

Mr. DENT. It was done under the supervision of the Alabama Power Co.—that is, the construction—but the disbursements and the payment for it were made through Government officers and by Government officers.

Mr. GARRETT. Did not the Alabama Power Co. have a contract to construct this work?

Mr. DENT. The only one they had was the one of November, 1918.

Mr. GARRETT. As to the actual construction work, did they have the contract, or some other corporation?

Mr. DENT. I believe some of the work was sublet.

Mr. MARTIN. On the minor part, such as grading, some contractors were employed, having teams, merely to do some grading work; but practically all of that was done in the name of the Alabama Power Co.

Mr. GARRETT. Though the Alabama Power Co. was the company that did do the construction?

Mr. MARTIN. Yes, sir.

Mr. GARRETT. The Alabama Power Co. constructed this building upon its property, and for that construction it received a fee, a cost-plus fee. Do I understand you to say that if this contract should fail, although the Alabama Power Co. made a contract with the Government to construct this property upon its real estate, and did, as a matter of fact, construct it and received a good fee for constructing it, it can then be heard to-day that it did not give its consent for this property to be placed upon its real estate?

Mr. DENT. You say if this contract failed, and that the Alabama Power Co. had a contract with the Government. You first state that the contract failed, and then you go on and assume that they had a contract.

Mr. GARRETT. No; I am assuming that they actually performed as though there was a written contract, although the contract may, for some reason, be declared null and void. I am now speaking on that question.

Mr. DENT. Of an implied contract?

Mr. GARRETT. On the question of the Alabama Power Co. having a continuous right to hold this property by virtue of the fact that the Government had put it upon its real estate, under the laws of Alabama.

Mr. DENT. I will repeat what I have repeatedly stated to the committee in answer to your question, because, of course, it is my opinion, which I give for what it is worth, that if this transaction had taken place between private parties or between private corporations that the law would imply a contract, and that there could be a recovery, at least upon quantum meruit, provided no valid written contract was made. But there is a difference when a contract is made with the Government. We went through all of that at the time of the passage of the Dent Act.

Mr. GARRETT. I understand that. You evidently do not catch my point, or I failed to make myself understood. I was rather astounded at your statement that under the law of Alabama, in the event that this contract should

fail, that the Alabama Power Co., under the law of Alabama, would have a right to hold all this property as a part of its realty, having been put upon its property in the absence of a written contract.

Now then, would the laws governing property rights in Alabama be different in a case where the Government is involved than one where private individuals or private corporations are involved?

Mr. DENT. The laws of Alabama would not be different on that subject, but the right to contract is different. If you have no contract at all, if the Government is in the attitude of being absolutely without any contract and has gone ahead and erected improvements without the consent or permission of the Alabama Power Co., the general law of the land is that the owner of the lands gets the benefit of the improvements under those circumstances.

Mr. GARRETT. My point is that that would be an impossible condition to arise in this case because the Alabama Power Co. put up these improvements.

Mr. DENT.. I think myself it would be an impossible condition to arise, because I think the contract is valid.

Mr. WURZBACH. Would you be willing to make a broad statement that an agent with power to sell could enter into an optional agreement binding upon the principal, without reference to the reasonableness of the terms of the optional agreement?

Mr. DENT. I do not know that I exactly understand that question put in such a general form.

Mr. WURZBACH. In other words, an optional agreement implies, from its very terms, a sale to one person as contradistinguished from a sale to any person willing to pay the price. It limits the possible purchasers by the very terms, does it not?

Mr. DENT. Yes.

Mr. WURZBACH. That is, the usual optional agreement? Do you think that an agent, under a power to sell, would be permitted to make an optional agreement, say, that no sale could be made except to one particular person, say, for a period of six years after the power of sale was granted to the agent?

Mr. DENT. I will answer that in this way, by stating the fact in connection with this contract.

Mr. WURZBACH. That is a hypothetical case?

Mr. DENT. Yes; and it is rather a moot question. But the facts in this case are that under the terms of this contract the Government had the right to demand that the Alabama Power Co. purchase this property, on the one hand, and the Alabama Power Co. had the right to demand of the Government that it sell the property. I do not see any reason why an agent, having authority to sell, can not go ahead and select the party to purchase the property, including that party in the agreement, at a certain specified time and stating that that party shall buy the property. I do not think the time limit has any effect upon the authority of the agent.

Mr. WURZBACH. I asked the question having in mind the acts of May and of July, 1918. I think you admit that is the only authority for the execution of this contract?

Mr. DENT. Yes, sir; that is true.

Mr. WURZBACH. You claim that that act gives authority to certain agents of the Government to sell Government property?

Mr. DENT. Yes, sir.

Mr. WURZBACH. There was no sale of the property made in this contract, but it is at most an option conferred upon the Alabama Power Co. to buy at a future date?

Mr. DENT. I do not agree with you that it is at most only an option. It is an absolute right on the part of the Government to demand that the Alabama Power Co. purchase this property; on the other hand, the Alabama Power Co., as the other contractor, has the absolute right to demand of the Government that it sell. There is no option in that.

Mr. WURZBACH. But the price was not agreed upon at that time.

Mr. DENT. No; the price was not agreed upon at that time, but the method was provided in the contract by which a price could be ascertained.

Mr. WURZBACH. According to the terms of the contract, if it is a legal contract, no one else could bid for the property except the Alabama Power Co.?

Mr. DENT. No, sir.

Mr. WURZBACH. Do you think the agents of the Government had the power under the authority of the acts of Congress of 1918 to make that kind of a contract?

Mr. DENT. I certainly do. I think it is necessarily implied within the terms of the absolute power of sale. It was a contract; it was an absolute contract to sell this property at a fixed period of time. I do not see any legal objection to that. There is no option in it that I can see.

Mr. WURZBACH. In any kind of an optional agreement, a usual optional agreement, it means, in effect, that no one else can buy except the person with whom the agreement is made?

Mr. DENT. That is true.

Mr. WURZBACH. And it is inconsistent with an open sale, is it not?

Mr. DENT. It is not a sale at that particular time; it is a sale at a future date, so far as this contract is concerned. I repeat that this contract is not, strictly speaking, an option contract.

Mr. WURZBACH. Except as to the price that is to be paid?

Mr. DENT. Except as to the price that is to be paid, but the sale——

Mr. WURZBACH. You think it is a binding agreement?

Mr. DENT. A binding agreement to sell at the time it was made, and the terms of sale, and the date of the sale were agreed upon, and the price of the property was to be fixed at a later time.

Mr. GARRETT. Under the law, Mr. Dent, has the Government the right as yet to demand the purchase of this property by the Alabama Power Co.?

Mr. DENT. Yes, sir.

Mr. GARRETT. What did the contract provide about three years subsequent?

Mr. DENT. The Government, as I recall the terms of the contract, could not make a demand until the expiration of three years after the war. Anybody who studies the matter can understand why that provision was put in the contract. At that time neither the Alabama Power Co. nor any other corporation could borrow any large sums of money, during the war, and nobody knew how long that financial condition was going to last after the war; and it was put in there so that the Alabama Power Co. would not be caught in such a condition when the company was in such a financial plight after the war so that it could not obtain money to carry out a contract; and that is a very fair and reasonable provision in the contract.

Mr. GARRETT. You mean that the Government could not demand that the Alabama Power Co. buy this property before three years subsequent to the conclusion of peace?

Mr. DENT. I think that is the term.

Mr. GARRETT. According to the proclamation of the President. So there is yet to run about two years, during which the Government can not get it, although the war has actually been over about six months.

Mr. DENT. That is the fault of Congress and the President that peace was not declared any earlier. It is not our fault.

Mr. GARRETT. But it is provided in the contract, on the other hand, that the company may demand that the Government sell it at any time?

Mr. DENT. Yes.

Mr. GARRETT. That the Government sell to you?

Mr. DENT. Yes.

Mr. GARRETT. But that the Government has to wait for a fixed period of years before it can demand the purchase?

Mr. DENT. Yes, sir.

Mr. GARRETT. Do you think that is sauce for the goose as well as sauce for the gander?

Mr. DENT. I think that is a fair proposition, and the reason was that if the Alabama Power Co. found itself in such a financial condition at any time that it could pay the Government for the property, the sooner it bought it the better off both the Government and the Alabama Power Co. would be, and the three-year clause was put in there because of the financial condition that necessarily follows every war.

Mr. GARRETT. Do you not think the three-year clause was put in there because the Alabama Power Co. expected to pay for the plant in three years out of its sinking fund which the Government was to pay for the power?

Mr. DENT. Of course, if the contract had run on and the Government had paid for the power, it would have come out of the sinking fund. But it was our property.

Mr. GARRETT. It was your property, created by the Government. You have a situation of the Government building your plant out of its own money, and then you fix it so the Government can not demand that you sell it, and then you create a sinking fund under which the Government could pay to you the

cost of the plant at the end of three years, which you expected it would do, and it would have done, if the plant had been operated to its full capacity. I do not see where the Alabama Power Co. is incurring any liability. In other words, here is a case where the Government built a plant and paid for it out of its own funds, and gave your company a commission for building it, and then you tie up the Government so you can demand that you may buy it in such a length of time so that you would have been able to pay for the cost of the plant out of the sinking fund created by the amount the Government paid for the power.

MR. DENT. If you had been the Government officer, you would not have written the contract in that way?

MR. GARRETT. No, I would not.

MR. DENT. But the contract is written that way, and the question is whether you are going to carry out its obligations.

MR. WURZBACH. Coming back along the same line of questions I propounded to you awhile ago, section 5 of article 22 of the contract has this provision:

"In the event that the contractor shall on demand of the United States fail or refuse to purchase the Warrior extension and Warrior substation under any of the foregoing subdivisions of this article, the United States may sell the same to another, subject to the conditions that said properties shall not be operated and that they shall be removed within six months after the sale has been consummated."

So, as a matter of fact, the agreement that was entered into, which we first called an optional agreement but which you stated was really not an option but a firm and binding agreement, on the face of the contract it is still optional with the company, and they do not have to buy this property at the terms provided in the agreement.

MR. DENT. I think they do, Mr. Wurzbach. I think that clause you have just read was put in there to protect the Government in the event the Alabama Power Co. could not carry out its contract.

MR. WURZBACH. Could not or would not?

MR. DENT. Could not or would not carry out this contract, and that the Government would have the alternative right to sell this property rather than suing the Alabama Power Co. for a breach of the contract.

MR. WURZBACH. Of selling it to some one else?

MR. DENT. Yes.

MR. GARRETT. Selling it to some one who would operate it?

MR. WURZBACH. And removing the property. Do you not think that is such a penalty to be attached against the Government if, as a matter of fact, it was entirely optional with the Alabama Power Co. whether or not they would buy that property?

MR. DENT. I do not. I think if the Government demands under that contract within the time limit that the Alabama Power Co. purchase the property, and the Alabama Power Co. refuses to do it, the Alabama Power Co. has broken the contract and would be liable for a breach of contract; and that the other remedy was an alternative remedy in case the Alabama Power Co. should become insolvent, for instance, before the expiration of that period.

MR. WURZBACH. Even if they were financially able to buy, you do not contend that in the face of section 5 they would be under any obligation to buy this property?

MR. DENT. Yes; I do. That is a privilege on the part of the Government.

MR. WURZBACH. I can not agree with you on that.

MR. DENT. You will have to construe the whole section together.

Now, Mr. Chairman, I will pass on as rapidly as I can. I believe that includes practically every proposition that my friend, Mr. Oliver, asserted before the committee yesterday, except a statement that this Muscle Shoals property was not property that was acquired for the emergency, but it was property that was acquired for permanent use. I just want simply to state that it occurs to me that the facts will not bear out my friend, Mr. Oliver's, contention in that respect, because the President located this plant there as a war-time measure, and it was located there during the war as a war measure. As a matter of fact, we will all recall that in the last Congress, in the closing days of the last Congress, those of us who were in favor of the continued development of Muscle Shoals undertook to get Congress to authorize the Government to go on with it as a permanent institution, and Congress turned us down, and the War Department closed shop completely. Now, what you are considering is whether or not it would be the intention to make that a permanent establish-

ment. As to what has been done down there, it was, strictly speaking, no more or no less than a war measure, which the President by his order made in order that we might be protected in the event that we could not get nitrates from Chile.

The last proposition is this: Mr. Oliver calls attention to a proviso in the act of July 9, 1918, and contends that that proviso shows that the act had its limitations, and that by reason of the fact that the Secretary of War should make a detailed report to Congress of the sales of war materials, lands, factories, or buildings and equipment sold under authority contained in this act. Now, Mr. Oliver states in his argument, after quoting that proviso in the language in which it is written in the law, that they had to report to Congress the terms of the sale, the price received, and so on, at the next regular session of Congress, which occurred within eight or nine months after the act was passed. I am sure my good friend and former colleague from Alabama did not intend to mislead the committee. I know he would not do anything of that kind; but he overlooked the fact that the language of that proviso reads this way, that a detailed report shall be made to Congress on the first day of each regular session of the sales of such war supplies. It was not limited, Mr. Oliver, to the next regular session; it provides expressly that a report must be made on the first day of each regular session following the sale under this authority. That is the language of the act itself, so the proviso can not be construed as my friend has contended. He evidently overlooked the word "each" in that proviso.

I believe that covers practically everything except one little paragraph that I want to call attention to, the closing paragraph in Mr. Oliver's remarks, the very last sentence, where he says by way of peroration, "Is there any man who ever studied law for a day that would for a moment contend that, where you confer authority to sell large and valuable property upon an agent and confer it upon him and him alone, the agent has the right in the exercise of that authority to sell to delegate to the party who is to buy the right to appoint some one to fix the price?"

You would conclude from reading that statement—that is, anybody who was not familiar with the terms of the contract—that Mr. Oliver intended to convey the idea that this contract gave to the Alabama Power Co. the right to fix the price of this property. I am sure Mr. Oliver did not intend that. But yet that is the way his language reads. I am sure when my good friend comes to revise his remarks he will change that somewhat, because there is absolutely nothing in the contract which authorizes the Alabama Power Co. to fix the price of that property. We have already shown you that.

In conclusion—and I am sorry I have taken up so much of the time of the committee—we contend that this property is not necessary for the public use at Muscle Shoals, and that we have a legal right which we can assert in the courts. We contend that the right to make an absolute sale carries with it the right to fix the time, the terms, and conditions of sale, all the details necessary. Those are the two main propositions asserted by my friend here.

We contend that under this contract we have the right, the absolute right, to purchase this property at a fair value to be fixed, if it can not be agreed upon, by arbitration; and we furthermore contend that under the law of Alabama, if the contract between the Government and the Alabama Power Co. is held to be absolutely void, and that there is no contract whatever between the parties, then under the law the property which the Government has placed upon our land belongs to us.

Mr. GARRETT. On the question of sale, under the contract that provides for sale but does not fix the terms. Does not the law in the respective States and does not the law in Alabama provide that where you have a contract for sale, but the terms and conditions of the sale are not fixed in the contract, there is a statute which provides that it shall be sold as under execution? Usually the States have such a statute, that where you have a contract providing for the disposition of property, as in this contract, but it does not fix the time or the terms, is there not generally a statute that provides that where there is no time fixed or no terms fixed in the contract that it shall be sold as under execution?

Mr. DENT. There is no such statute in Alabama.

Mr. Chairman, let me call your attention to a daily news letter issued by the War Department on Tuesday, August 18, 1918. I just want to have this go in the record, showing that the action of the Government in furnishing money to increase manufacturing facilities during the war was not limited to the Alabama Power Co. That was an ordinary form of contract that the Government

entered into with various manufacturing industries during the war. This circular issued by Gen. Goethals contains this language:

"The increased manufacturing facilities that have been created by the War Department, exclusive of the new industries serving the Navy and the Emergency Fleet Corporation, from April 7, 1917, to July, 1918, cost approximately \$400,000,000. So ours is not a peculiar contract; that was the ordinary form of contract in this case."

Now, Mr. Chairman, I am advised that Maj. Booten, of the Ordnance Department, who has the records of the department in reference to this contract, is here and prepared to give the testimony which I stated we could establish to show that the Secretary of War himself did authorize the making of this contract. Are you ready to hear him now?

Mr. OLIVER. I wonder if the committee would give me a few moments?

Mr. GREENE (acting chairman). What is the committee's pleasure? Without objection, Mr. Oliver may proceed.

ADDITIONAL STATEMENT OF HON. WILLIAM B. OLIVER, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ALABAMA.

Mr. OLIVER. Mr. Chairman, I appreciate the indulgence of the committee, and will endeavor not to impose long on your valuable time.

Mr. Dent and I are not exceptions to the ordinary lawyers who drift into the habit of confidently asserting the correctness of our respective positions. In this case, fortunately for me, I think Mr. Dent has referred the committee to a decision which, if you will carefully read, fully answers the position he now takes, and is an unquestioned authority in support of the position taken by me on yesterday. It is not unusual for two lawyers to think that one and the same decision constitutes an authority for the positions taken by each of them.

Mr. DENT. Or to think they have.

Mr. OLIVER. As to my remarks on yesterday, I had no opportunity to prepare a brief, and my statement was made in an impromptu way, but the questions of law involved were simple and well and thoroughly settled, and I can but feel that the committee will agree as to the correctness of my position.

I stated that since the Government had a national project at Muscle Shoals devoted, and to continue to be devoted, to a public use, that Congress had the unquestioned right to determine what property was necessary to be taken by condemnation for the enjoyment or furtherance of such national project, and that when Congress directed what property was necessary and should be acquired by condemnation, that the necessity for the taking of such property was a matter of legislative decision and not open to the courts for review. I still insist that this is the law, and the case cited by Mr. Dent is the highest authority for the correctness of my position.

In the case he refers to, two questions were raised: First, whether a battle ground could be acquired and set apart for public use, and second, whether Congress had the right to determine what property should be taken in connection therewith for such public use and enjoyment. In that case a railroad company contested the right of the Government, through Congress, to first declare that the battle ground could be maintained and set apart for public use, and second, even though the court should hold that such was a proper public use that the right of way of the railroad company, which Congress had directed should be condemned, was in no way necessary to the use and enjoyment of the battle ground. The court held that Congress had properly declared a public use by seeking to preserve the battle ground at Gettysburg, and that since it had declared a public use at such place, the question as to what property should be taken for that public use was altogether a legislative question, and the necessity for the taking of such property as Congress might determine should be taken could not be inquired into by any court. The court simply held that courts could inquire into the public use sought to be declared by Congress, but when a proper public use was found that then the action of Congress in declaring what property should be taken for the enjoyment of that public use was a legislative and not a judicial question.

I read in support of my decision this excerpt from the decision cited by Mr. Dent:

"It is also objected that the exception below is valid, wherein it is stated that all of the land of the railroad company ought to be taken, if any were to be taken. The use for which the land is to be taken having been determined to be a public use, the quantity which should be taken is a legislative and not a judicial question," citing the case of *Shoemaker v. The U. S.*, 147 U. S. Reports.

These are the decisions that Mr. Miller, a member of the committee, had in mind when he asked Mr. Dent, "Have you any authority holding that where a public use has been properly fixed and declared, that it is then a matter of judicial determination as to the necessity for taking property to carry out such public use, where Congress had declared the taking of such property a necessity?"

Mr. Dent had no authority which he could cite Mr. Miller to, and I submit he can find none. The very authority he reads to the committee denies the position he asserts.

On yesterday the committee will recall that I stated that since the Government owned a nitrate plant at Muscle Shoals, which was to serve the Government in war and in peace for a public use, and since the question now before the committee was whether the power plant at Gorgas and the transmission line leading therefrom, constructed with Government money, on land of the Alabama Power Co., and which supplied electric energy and power to the nitrate plant at Muscle Shoals, was necessary for the use and enjoyment of such nitrate plant, if Congress decided that it was, and ordered the acquirement of the land on which the Government property was situated, by condemnation, that the action of Congress would be conclusive on the question of necessity, and could not be inquired into by any court. The rereading of my remarks on yesterday will show to the committee that that was the position I took.

Mr. FIELDS. You meant the power plant at Gorgas?

Mr. OLIVER. Yes. In conclusion, I do not think my distinguished friend and former colleague, Mr. Dent, will be able to supply the committee with any authority to sustain the position he announces as to the law of agency. I have read the law of agency to no effect, if Mr. Dent's remarkable declaration of what a simple power to sell, with the qualifying proviso, which I called attention to on yesterday, can be construed into an authority for the agent to postpone the right of the principal to sell his property for six years, and further authorize an option on the property, delivering possession to the optionee with the right to use the property, during such term of six years, when the right of the principal has been postponed to sell, the optionee, however, having the right to purchase during such time if he so elects, and should he elect at the expiration of said six years to purchase and the price and value of the property at that time could not be agreed on, that then the optionee should have the right to appoint an arbitrator and the Government an arbitrator, and these two the right to select a third to ascertain and fix the value of the property at such postponed time. Surely my friend will not insist that the President or head of an executive department, authorized by the July 9 act to sell war emergency property, requiring that where a sale was made that a report should be submitted to the next ensuing regular session of Congress, showing the property sold, to whom sold, for what purpose sold, and the price received, would authorize the President or head of an executive department, one or both, to enter into a contract which, according to its terms, would postpone the right of the Government to sell the property to anyone for six years, giving to the Alabama Power Co. during this time the use of the property and the right to purchase if they so elected, and if the price, when its election to purchase was so exercised, if ever, could not be agreed on, that then the power company might appoint one arbitrator, the Government one, and these two a third, could by any stretch of the imagination be construed as a proper exercise of authority by the President or the head of an executive department under the said act. If he can find any authority to sustain him in that contention, I am sure the lawyers on the committee will be glad to read it. Mr. Wurzbach properly called attention to the absurdity of such an insistence.

There is no law so well understood as that the agent must get his authority absolutely from the principal, and all reasonable intendments against the improper exercise of it are indulged in favor of the principal, and the party dealing with an agent must himself consult the authority under which the agent seeks to act, and is chargeable with notice of every limitation placed on the agent. Surely, in the power given by Congress to the President or to the head of an executive department to sell property, no authority was given to anyone, whether President or head of an executive department, much less to

a subordinate, to postpone the right of the Government to dispose of that property for three or six years and to grant to a prospective purchaser an option on and the free use of it during such postponed period, or to exercise a right which he might or might not claim, to call for an earlier sale.

I am astounded that the gentleman could read into any law of agency so broad an interpretation as that.

Now, in reference to his criticism of my statement of the proviso in the act of July, if he had read just a little further on in the speech, he would have found that it was subject to this limitation, that the agent must report sales made prior to the next session of Congress. Of course, that is what I meant. In other words, if the President, or head of an executive department, undertook, in the exercise of the authority to sell, granted by the act of July, to sell before the next regular session of Congress, then as to the sales he undertook to make, he was to report the purchaser, the purpose of the sale, and the price received. In this case it so happened that the power company claimed that there was a sale to it before the December session of 1918. Then, under the provisions of the act of July 9, the agent had to report that sale to the December, 1918, session of Congress. And in doing so he had to report the name of the purchaser, the purpose for which he bought it, and the price received. Pray tell me how the agent in this case, granting that he had authority to sell, could have reported those facts, since, lo and behold, we find no price is fixed, or even is to be considered, until after three years from the date when the proclamation of peace is issued by the President. That proviso of itself served notice on all prospective purchasers that if you undertake to buy property from the Government under act of July, 1918, you must, before the next session of Congress, in so far as to that which you now seek to buy, agree definitely on the terms of the sale, because the agent of the Government is only authorized to sell when he can report that fact back to Congress.

How could this requirement of Congress, as set out in the proviso of the July 9 act, have been complied with?

I thank you, Mr. Chairman and gentlemen.

Mr. HULL. I would like to ask you one question. Probably I do not understand the matter. I understand from your argument that you claim that decision gives Congress the right to take this property away from the Alabama Power Co. and at the same time, practically, to make a contract with Henry Ford for its purchase. In other words, I have not any doubt that we have the right to take it for our own use, but there is a question in my mind as to whether we have the right to take this property from the Alabama Power Co. and transfer it to Henry Ford.

Mr. OLIVER. That question was asked on yesterday in your absence.

Mr. HULL. Do you claim that the decision you quoted gives us that right? It is not clear in my mind that it does.

Mr. OLIVER. I stated on yesterday in reply to a similar question that this property, as I understood, if you should order it taken by the Government, is to be used in connection with a governmental purpose which you in the 1916 act had declared to be a national project, to wit, the maintenance of the nitrate units at Muscle Shoals, and they were to be kept by the party to whom you might sell or lease, if the proposition now before you is accepted, for 100 years in a stand-by ready condition, and I thought that if the Gorgas Power Plant was taken to supply electric current to Nitrate Plant No. 2, that would be in connection with the use and permanent operation of a national project, and on that hypothesis unquestionably had the right to acquire and condemn the Gorgas plant.

Mr. HULL. I agree with you as to plant No. 2, and that, fundamentally, is what we are after, the preservation of plant No. 2. But if we do it under that power, then we have got to establish in a court that this plant at Gorgas, 88 miles away, was essential to plant No. 2.

Mr. OLIVER. No.

Mr. HULL. I think you would.

Mr. OLIVER. This decision holds, Mr. Hull, I think you will find if you read it carefully, that since you have declared a public use which is recognized as a public use, at Muscle Shoals, for a national project, then you have the right to condemn property to be used in connection therewith, and Congress determine the necessity of what property is necessary for the operation of that plant at Muscle Shoals. That is a legislative question and not a judicial one.

Mr. HULL. But there is nothing in the Ford contract as to the preservation of this transmission line to the Gorgas plant for the use of the Government in the future, is there?

Mr. OLIVER. That is the way I read it, Mr. Hull; that is my understanding of it.

Mr. GREENE. We are very much obliged to you, Mr. Oliver.

Mr. OLIVER. I appreciate the courtesy of the committee very much.

(Thereupon, the committee adjourned to meet to-morrow, Thursday, March 2, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS.

HOUSE OF REPRESENTATIVES.

Thursday, March 2, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. I have before me two letters asking that certain statements be put in the record so as to correct other statements that have been made here. One is from Mr. Waldo, calling attention to a telegram from Mr. Swann, and the other letter is from Mr. Bower, and, if there is no objection, the letters will be put in the record.

(The letters referred to follow:)

WASHINGTON, D. C., February 27, 1922.

Hon. JULIUS KAHN,

Chairman Committee on Military Affairs,

House of Representatives, Washington, D. C.

DEAR Mr. KAHN: In order to meet the representations made by Mr. Hammitt regarding the limitations of the Swann process for the manufacture of phosphoric acid, I wired Mr. Swann advising him of their statement regarding his process and have received the attached reply.

Will you kindly read this into the record and very much oblige,

Respectfully,

W. G. WALDO.

[Telegram.]

BIRMINGHAM, ALA., February 20, 1922.

W. G. WALDO,

No. 205 Third Street, SE., Washington, D. C.:

American Cyanamid Co. representatives have no definite knowledge of our operations. Their statements are incorrect. Phosphoric acid can be made in large quantity by our process without producing tonnage of ferrophosphorus in excess of market requirements. We have made every effort to produce largest tonnage possible of ferrophosphorus because price was higher per unit of phosphoric acid than in fertilizer.

THEODORE SWANN.

FARM BUREAU, AMERICAN FEDERATION.

Washington, D. C., March 1, 1922.

Hon. JULIUS KAHN,

Chairman Committee on Military Affairs,

House of Representatives, Washington, D. C.

DEAR Mr. KAHN: In the hearings of yesterday, February 28, Mr. Martin, president of the Alabama Power Co., called the attention of the committee to a seeming contradiction between testimony I gave before the subcommittee of the Appropriations Committee of the House, February 15, 1921, and the testimony I presented to your committee February 23, 1922. This seeming contradiction being that before the Appropriations Committee I stated that his nitrate plant could operate on secondary power and before your committee that it could not.

I desire to call to your attention the fact that in 1921 it was a Government corporation not operating for profit which, in addition to operating the ultrate plant, had the control of and could sell all the power generated by the Wilson Dam, by the steam plant in connection with No. 2 nitrate plant, and also the power from the Gorgas River plant. A single corporation operating both the nitrate plant and all this power, I submit, might, in order to sell a complete

block of 100,000 primary horsepower, operate the nitrate plant on secondary horsepower by at least two methods.

First. As suggested to the Appropriations Committee, during periods of low water the carbide furnaces might be temporarily closed but the balance of the plant kept in operation. This could only be done by the utilization of the additional secondary horsepower—over and above the secondary horsepower required for the operation of the nitrate plant—which is available from the flow of the river during the periods of high water for the operation of stand-by carbide furnaces—2 of the 12 are so designated—to accommodate sufficient carbide to continue the operation of the balance of the plant during the time it was shut down. This is based on having sufficient primary power to operate continuously all of the nitrate plant except the carbide furnaces. These furnaces use approximately 90 per cent of the power consumed in operating No. 2 plant. Of course, this would entail considerable expense which such a corporation, however, might well charge against the cost of selling the block of 100,000 primary horsepower at commercial prices.

Second. It might operate the nitrate plant on secondary power, and in periods of low later utilize the steam power plant at nitrate plant No. 2 for the operation of this plant during low-water periods. Again, in this case the extra cost entailed in the using of the steam power during the low-water period could properly be charged as cost against the sale of this 100,000 primary horsepower.

I wish to submit, however, that under the present situation a company leasing nitrate plant No. 2 under the terms of the Alabama Power Co.'s lease could not avail themselves of either of these two methods, and consequently my belief is that it could not bear the expense of closing down the plant during low-water periods.

Testimony of Mr. Swan, as you will remember, dealt with the production of phosphoric acid in electric furnaces. This does not necessitate the expensive air liquefaction of a nitrate fixation plant and is simply an electric furnace operation in which the phosphate rock is treated directly in the furnace phosphoric acid obtained and utilized in treating more phosphate rock in the production of double superphosphates. I do not desire to differ with Mr. Swan that such operation as this might be operated on secondary power and close down during low-water periods, but this is not analogous to the operation of the nitrate plant No. 2 with the large investment in machinery required for the air-fixation feature of it, which is the question when you consider operating nitrate plant No. 2 with such secondary horsepower as would be provided by the Alabama Power Co.

I would greatly appreciate it if you would bring this statement to the attention of the committee and allow it to be printed in the hearing directly following the testimony of the Alabama Power Co., and I wish to say in fairness to Mr. Martin, that had he analyzed the situation as above set out I do not believe he would have called the attention of the committee to the so-called contradiction.

Very truly, yours,

AMERICAN FARM BUREAU FEDERATION.
R. F. BOWER, *Special Assistant*.

STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO.—Resumed.

The CHAIRMAN. Mr. Martin, we will now proceed from where we left off. Mr. Miller was asking you some questions, but he tells me he has concluded, and Mr. Hill would like to question you.

Mr. HILL. Mr. Martin, thanks very largely to some of the senior members of this committee, the United States has a definite national-defense policy at this time. The Fourth Army Corps Area takes in North Carolina, South Carolina, Tennessee, Mississippi, Florida, Georgia, and Alabama. It has been recommended by this committee that Camp McClellan, which is near Anniston, be retained as the headquarters training area for that corps. I have before me here the map of the Alabama Power Co.'s distributing system, which you furnished the committee, and I want to ask you if I am correct in these estimates of mileages which I have made, using the scale that you have on this map. As I see it from this map, nitrate plant No. 2 is 120 miles from Anniston on a straight line.

Mr. MARTIN. That is approximately correct.

Mr. HULL. But there is nothing in the Ford contract as to the preservation of this transmission line to the Gorgas plant for the use of the Government in the future, is there?

Mr. OLIVER. That is the way I read it, Mr. Hull; that is my understanding of it.

Mr. GREENE. We are very much obliged to you, Mr. Oliver.

Mr. OLIVER. I appreciate the courtesy of the committee very much.

(Thereupon, the committee adjourned to meet to-morrow, Thursday, March 2, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS.

HOUSE OF REPRESENTATIVES.

Thursday, March 2, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

The CHAIRMAN. I have before me two letters asking that certain statements be put in the record so as to correct other statements that have been made here. One is from Mr. Waldo, calling attention to a telegram from Mr. Swann, and the other letter is from Mr. Bower, and, if there is no objection, the letters will be put in the record.

(The letters referred to follow:)

WASHINGTON, D. C., February 27, 1922.

Hon. JULIUS KAHN,

Chairman Committee on Military Affairs,

House of Representatives, Washington, D. C.

DEAR Mr. KAHN: In order to meet the representations made by Mr. Hammitt regarding the limitations of the Swann process for the manufacture of phosphoric acid, I wired Mr. Swann advising him of their statement regarding his process and have received the attached reply.

Will you kindly read this into the record and very much oblige,

Respectfully,

W. G. WALDO.

[Telegram.]

BIRMINGHAM, ALA., February 20, 1922.

W. G. WALDO,

No. 205 Third Street, S.E., Washington, D. C.:

American Cyanamid Co. representatives have no definite knowledge of our operations. Their statements are incorrect. Phosphoric acid can be made in large quantity by our process without producing tonnage of ferrophosphorus in excess of market requirements. We have made every effort to produce largest tonnage possible of ferrophosphorus because price was higher per unit of phosphoric acid than in fertilizer.

THEODORE SWANN.

FARM BUREAU, AMERICAN FEDERATION.

Washington, D. C., March 1, 1922.

Hon. JULIUS KAHN,

Chairman Committee on Military Affairs,

House of Representatives, Washington, D. C.

DEAR Mr. KAHN: In the hearings of yesterday, February 28, Mr. Martin, president of the Alabama Power Co., called the attention of the committee to a seeming contradiction between testimony I gave before the subcommittee of the Appropriations Committee of the House, February 15, 1921, and the testimony I presented to your committee February 23, 1922. This seeming contradiction being that before the Appropriations Committee I stated that his nitrate plant could operate on secondary power and before your committee that it could not.

I desire to call to your attention the fact that in 1921 it was a Government corporation not operating for profit which, in addition to operating the nitrate plant, had the control of and could sell all the power generated by the nitrate Dam, by the steam plant in connection with No. 2 nitrate plant, and power from the Gorgas River plant. A single corporation operating the nitrate plant and all this power, I submit, might, in or

block of 100,000 primary horsepower, operate the nitrate plant on secondary horsepower by at least two methods.

First. As suggested to the Appropriations Committee, during periods of low water the carbide furnaces might be temporarily closed but the balance of the plant kept in operation. This could only be done by the utilization of the additional secondary horsepower—over and above the secondary horsepower required for the operation of the nitrate plant—which is available from the flow of the river during the periods of high water for the operation of stand-by carbide furnaces—2 of the 12 are so designated—to accommodate sufficient carbide to continue the operation of the balance of the plant during the time it was shut down. This is based on having sufficient primary power to operate continuously all of the nitrate plant except the carbide furnaces. These furnaces use approximately 80 per cent of the power consumed in operating No. 2 plant. Of course, this would entail considerable expense which such a corporation, however, might well charge against the cost of selling the block of 100,000 primary horsepower at commercial prices.

Second. It might operate the nitrate plant on secondary power, and in periods of low later utilize the steam power plant at nitrate plant No. 2 for the operation of this plant during low-water periods. Again, in this case the extra cost entailed in the using of the steam power during the low-water period could properly be charged as cost against the sale of this 100,000 primary horsepower.

I wish to submit, however, that under the present situation a company leasing nitrate plant No. 2 under the terms of the Alabama Power Co.'s lease could not avail themselves of either of these two methods, and consequently my belief is that it could not bear the expense of closing down the plant during low-water periods.

Testimony of Mr. Swan, as you will remember, dealt with the production of phosphoric acid in electric furnaces. This does not necessitate the expensive air liquefaction of a nitrate fixation plant and is simply an electric furnace operation in which the phosphate rock is treated directly in the furnace phosphoric acid obtained and utilized in treating more phosphate rock in the production of double superphosphates. I do not desire to differ with Mr. Swan that such operation as this might be operated on secondary power and close down during low-water periods, but this is not analogous to the operation of the nitrate plant No. 2 with the large investment in machinery required for the air-fixation feature of it, which is the question when you consider operating nitrate plant No. 2 with such secondary horsepower as would be provided by the Alabama Power Co.

I would greatly appreciate it if you would bring this statement to the attention of the committee and allow it to be printed in the hearing directly following the testimony of the Alabama Power Co., and I wish to say in fairness to Mr. Martin, that had he analyzed the situation as above set out I do not believe he would have called the attention of the committee to the so-called contradiction.

Very truly, yours,

AMERICAN FARM BUREAU FEDERATION.
R. F. BOWER, *Special Assistant*.

STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO.—Resumed.

The CHAIRMAN. Mr. Martin, we will now proceed from where we left off. Mr. Miller was asking you some questions, but he tells me he has concluded, and Mr. Hill would like to question you.

Mr. HILL. Mr. Martin, thanks very largely to some of the senior members of this committee, the United States has a definite national-defense policy at this time. THEODORE SWANN.

FARM BUREAU, AMERICAN FEDERATION.

Washington, D. C., March 1, 1922.

Hon. JULIUS KAHN,

Chairman Committee on Military Affairs,

House of Representatives, Washington, D. C.

DEAR Mr. KAHN: In the hearings of yesterday, February 28, Mr. Martin, president of the Alabama Power Co., called the attention of the committee to a seeming contradiction between testimony I gave before the subcommittee of the Appropriations Committee of the House, February 15, 1921, and the testimony I presented to your committee February 23, 1922. This seeming contradiction being that before the Appropriations Committee I stated that his nitrate plant could operate on secondary power and before your committee that it could not.

I desire to call to your attention the fact that in 1921 it was a Government corporation not operating for profit which, in addition to operating the plant, had the control of and could sell all the power generated by the ~~the~~ Dam, by the steam plant in connection with No. 2 nitrate plant, ~~the~~ power from the Gorgas River plant. A single corporation ~~the~~ nitrate plant and all this power, I submit, might, in order

entered into with various manufacturing industries during the war. This circular issued by Gen. Goethals contains this language:

"The increased manufacturing facilities that have been created by the War Department, exclusive of the new industries serving the Navy and the Emergency Fleet Corporation, from April 7, 1917, to July, 1918, cost approximately \$400,000,000. So ours is not a peculiar contract; that was the ordinary form of contract in this case."

Now, Mr. Chairman, I am advised that Maj. Booten, of the Ordnance Department, who has the records of the department in reference to this contract, is here and prepared to give the testimony which I stated we could establish to show that the Secretary of War himself did authorize the making of this contract. Are you ready to hear him now?

Mr. OLIVER. I wonder if the committee would give me a few moments?

Mr. GREENE (acting chairman). What is the committee's pleasure? Without objection, Mr. Oliver may proceed.

ADDITIONAL STATEMENT OF HON. WILLIAM B. OLIVER, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF ALABAMA.

Mr. OLIVER. Mr. Chairman, I appreciate the indulgence of the committee, and will endeavor not to impose long on your valuable time.

Mr. Dent and I are not exceptions to the ordinary lawyers who drift into the habit of confidently asserting the correctness of our respective positions. In this case, fortunately for me, I think Mr. Dent has referred the committee to a decision which, if you will carefully read, fully answers the position he now takes, and is an unquestioned authority in support of the position taken by me on yesterday. It is not unusual for two lawyers to think that one and the same decision constitutes an authority for the positions taken by each of them.

Mr. DENT. Or to think they have.

Mr. OLIVER. As to my remarks on yesterday, I had no opportunity to prepare a brief, and my statement was made in an impromptu way, but the questions of law involved were simple and well and thoroughly settled, and I can but feel that the committee will agree as to the correctness of my position.

I stated that since the Government had a national project at Muscle Shoals devoted, and to continue to be devoted, to a public use, that Congress had the unquestioned right to determine what property was necessary to be taken by condemnation for the enjoyment or furtherance of such national project, and that when Congress directed what property was necessary and should be acquired by condemnation, that the necessity for the taking of such property was a matter of legislative decision and not open to the courts for review. I still insist that this is the law, and the case cited by Mr. Dent is the highest authority for the correctness of my position.

In the case he refers to, two questions were raised: First, whether a battle ground could be acquired and set apart for public use, and second, whether Congress had the right to determine what property should be taken in connection therewith for such public use and enjoyment. In that case a railroad company contested the right of the Government, through Congress, to first declare that the battle ground could be maintained and set apart for public use, and second, even though the court should hold that such was a proper public use that the right of way of the railroad company, which Congress had directed should be condemned, was in no way necessary to the use and enjoyment of the battle ground. The court held that Congress had properly declared a public use by seeking to preserve the battle ground at Gettysburg, and that since it had declared a public use at such place, the question as to what property should be taken for that public use was altogether a legislative question, and the necessity for the taking of such property as Congress might determine should be taken could not be inquired into by any court. The court simply held that courts could inquire into the public use sought to be declared by Congress, but when a proper public use was found that then the action of Congress in declaring what property should be taken for the enjoyment of that public use was a legislative and not a judicial question.

I read in support of my decision this excerpt from the decision cited by Mr. Dent:

Mr. HULL. But there is nothing in the Ford contract as to the preservation of this transmission line to the Gorgas plant for the use of the Government in the future, is there?

Mr. OLIVER. That is the way I read it, Mr. Hull; that is my understanding of it.

Mr. GREENE. We are very much obliged to you, Mr. Oliver.

THEODORE SWANN.

FARM BUREAU, AMERICAN FEDERATION,

Washington, D. C., March 1, 1922.

Hon. JULIUS KAHN,

Chairman Committee on Military Affairs,

House of Representatives, Washington, D. C.

DEAR Mr. KAHN: In the hearings of yesterday, February 28, Mr. Martin, president of the Alabama Power Co., called the attention of the committee to a seeming contradiction between testimony I gave before the subcommittee of the Appropriations Committee of the House, February 15, 1921, and the testimony I presented to your committee February 23, 1922. This seeming contradiction being that before the Appropriations Committee I stated that his nitrate plant could operate on secondary power and before your committee that it could not.

I desire to call to your attention the fact that in 1921 it was a Government corporation not operating for profit which, in addition to operating the nitrate plant, had the control of and could sell all the power generated by the Wilson Dam, by the steam plant in connection with No. 2 nitrate plant, and also the power from the Gorgas River plant. A single corporation operating both the nitrate plant and all this power, I submit, might, in order to sell a complete

block of 100,000 primary horsepower, operate the nitrate plant on secondary horsepower by at least two methods.

First. As suggested to the Appropriations Committee, during periods of low water the carbide furnaces might be temporarily closed but the balance of the plant kept in operation. This could only be done by the utilization of the additional secondary horsepower—over and above the secondary horsepower required for the operation of the nitrate plant—which is available from the flow of the river during the periods of high water for the operation of stand-by carbide furnaces—2 of the 12 are so designated—to accommodate sufficient carbide to continue the operation of the balance of the plant during the time it was shut down. This is based on having sufficient primary power to operate continuously all of the nitrate plant except the carbide furnaces. These furnaces use approximately 80 per cent of the power consumed in operating No. 2 plant. Of course, this would entail considerable expense which such a corporation, however, might well charge against the cost of selling the block of 100,000 primary horsepower at commercial prices.

Second. It might operate the nitrate plant on secondary power, and in periods of low later utilize the steam power plant at nitrate plant No. 2 for the operation of this plant during low-water periods. Again, in this case the extra cost entailed in the using of the steam power during the low-water period could properly be charged as cost against the sale of this 100,000 primary horsepower.

I wish to submit, however, that under the present situation a company leasing nitrate plant No. 2 under the terms of the Alabama Power Co.'s lease could not avail themselves of either of these two methods, and consequently my belief is that it could not bear the expense of closing down the plant during low-water periods.

Testimony of Mr. Swan, as you will remember, dealt with the production of phosphoric acid in electric furnaces. This does not necessitate the expensive air liquefaction of a nitrate fixation plant and is simply an electric furnace operation in which the phosphate rock is treated directly in the furnace phosphoric acid obtained and utilized in treating more phosphate rock in the production of double superphosphates. I do not desire to differ with Mr. Swan that such operation as this might be operated on secondary power and close down during low-water periods, but this is not analogous to the operation of the nitrate plant No. 2 with the large investment in machinery required for the air-fixation feature of it, which is the question when you consider operating nitrate plant No. 2 with such secondary horsepower as would be provided by the Alabama Power Co.

I would greatly appreciate it if you would bring this statement to the attention of the committee and allow it to be printed in the hearing directly following the testimony of the Alabama Power Co., and I wish to say in fairness to Mr. Martin, that had he analyzed the situation as above set out I do not believe he would have called the attention of the committee to the so-called contradiction.

Very truly, yours,

AMERICAN FARM BUREAU FEDERATION.
R. F. BOWER, *Special Assistant*.

STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO.—Resumed.

The CHAIRMAN. Mr. Martin, we will now proceed from where we left off. Mr. Miller was asking you some questions, but he tells me he has concluded, and Mr. Hill would like to question you.

MR. HILL. Mr. Martin, thanks very largely to some of the senior members of this committee, the United States has a definite national-defense policy at this time. The Fourth Army Corps Area takes in North Carolina, South Carolina, Tennessee, Mississippi, Florida, Georgia, and Alabama. It has been recommended by this committee that Camp McClellan, which is near Anniston, be retained as the headquarters training area for that corps. I have before me here the map of the Alabama Power Co.'s distributing system, which you furnished the committee, and I want to ask you if I am correct in these estimates of mileages which I have made, using the scale that you have on this map. As I see it from this map, nitrate plant No. 2 is 120 miles from Anniston on a straight line.

MR. MARTIN. That is approximately correct.

Mr. HILL. The Warrior reserve steam plant I figure to be 70 miles from Anniston, roughly speaking.

Mr. MARTIN. That is about right, Mr. Hill.

Mr. HILL. And nitrate plant No. 2 is, roughly, 75 miles from the Warrior reserve steam plant?

Mr. MARTIN. As the transmission line is constructed, which I think is really the nearest route, it is nearer 80 miles.

Mr. STOLL. Eighty-eight miles.

Mr. HILL. The transmission line, I understand, is 88 miles. I was simply figuring this on air-line distances for purposes of comparison.

Mr. MARTIN. You understand that in building a transmission line you have got to build it with reference to contours, railroads, supplies, and in some instances they can not be directly on an air line because mountains or valleys or marsh conditions may slightly change the direction.

Mr. HILL. That is a very hilly country through there and some parts of it are mountainous.

Mr. MARTIN. We have to select the route to some extent with reference to the contour of the land.

Mr. HILL. Camp McClellan is situated, roughly, in approximately the center of this Fourth Army Corps Area. Your Gadsden reserve plant is very close to Anniston, is it not?

Mr. MARTIN. Yes, sir; about 30 miles from Anniston.

Mr. HILL. During the war your company furnished the American Government light and power for the Camp McClellan situation, did it not?

Mr. MARTIN. Yes, sir; we furnished the light and power at Camp McClellan, and we are still supplying, of course, the light and power that is used at Camp McClellan.

Mr. HILL. In other words, your company during the war supplied what power and light was needed at Camp McClellan and is still doing so for Government purposes?

Mr. MARTIN. That is correct, Mr. Hill.

Mr. HILL. And your company's network of plants and lines runs all through that country, Gadsden, Camp McClellan, Talladega, and all that region down through there?

Mr. MARTIN. That is correct, Mr. Hill.

Mr. HILL. That is a very rough, mountainous country through there?

Mr. MARTIN. Some parts of it are quite mountainous.

Mr. HILL. And especially near Camp McClellan.

Mr. MARTIN. Yes.

Mr. HILL. But it was considered by the War Department one of their very best southern training camps?

Mr. MARTIN. Undoubtedly it is, Mr. Hill, because the country is very healthy and there are many advantages, of course, which you understand, because I understand you were there for a while.

Mr. HILL. Yes; I was there for nearly a year, and I know that general country. We maneuvered all around that Gadsden country and Talladega country with the division.

Mr. MARTIN. Yes.

Mr. HILL. Were you here during most of these hearings, Mr. Martin?

Mr. MARTIN. I was not in the room. I was in Washington during all of these hearings; yes.

Mr. HILL. I want to call your attention to page 374 of the hearings. Have you that volume before you? It is part 7.

Mr. MARTIN. Mr. J. W. Worthington's statement.

Mr. HILL. Yes; this is Mr. J. W. Worthington's statement given on Thursday, February 16. Mr. Worthington appeared as chairman of the executive committee of the Tennessee River Improvement Association. I asked him certain questions and he would like to read a portion of that page in order to bring the matter up again. We were discussing the guaranties offered by the Ford proposition for the production of fertilizer, and I suggested a different method of measuring the guaranteed power that was to be put in fertilizer. There had been some question about how much finished fertilizer would be the equivalent of 110,000 tons a year of nitrate, and there was some uncertainty about it. I said this:

"Mr. HILL. In connection with your expression in reference to the allotment, whether there would be any allotment of a definite amount of horsepower for

the use of the fertilizer plant and the nitrate plant, what would that be in value?

"Mr. WORTHINGTON. In that particular case, measuring the production of nitrate plant No. 2 in ammonium nitrate, it would be about 110,000 horsepower.

"Mr. HILL. You spoke of its being from 100,000 to 110,000 horsepower.

"Mr. WORTHINGTON. Stating the production in terms of ammonium nitrate.

"Mr. HILL. Would it be a thing for us to consider here in connection with section 14, concerning which there has been a good many questions—you probably recollect that the Secretary of War testified that he was not clear as to the guaranty for the production of fertilizer, so we have been particularly interested in section 14. Suppose we added to section 14, in the third line, after the words 'ammonium nitrate per annum' something to this effect: 'And that the company would promise to devote to the said production 100,000 of primary horsepower from dams Nos. 2 and 3, or from the steam plant at Gorgas, or the steam plant at nitrate plant No. 2 throughout the lease period.' That is providing that there would be a devotion of a certain amount of horsepower to that production of fertilizer.

"Mr. WORTHINGTON. That section absolutely carries that amount of power that Nitrate Plant No. 2 is operated to the capacity production of 110,000 tons of ammonium nitrate or its equivalent.

"Mr. HILL. I so understood from you. Would there be any objection to putting that in as an amendment to the provisions of the section—that they devote a minimum of 100,000 horsepower to the production of fertilizer?

"Mr. WORTHINGTON. You will, I am sure, appreciate how one in my position is situated right now; that I could not answer whether Mr. Ford would agree to that.

"Mr. HILL. Would you mind talking that over with Mr. Ford?

"Mr. WORTHINGTON. I will discuss it with Mr. Mayo, and we will see what can be done."

Now, I am much interested to see that in your offer you have measured your annual rental, as you might say, or your annual return to the Government, in power on that horsepower basis. Now I hold in my hand the printed copy of your offer furnished by the Secretary of War. You offer, in the first place, to take out a license under which you will complete the dam, locks, and power house at Dam No. 2, which is the Wilson Dam. Second, you offer to furnish free to the Government, or anyone it may designate, from the hydro-power plant 100,000 horsepower as required for the production of fertilizer and the munitions of war and for research in connection therewith, and if, due to changes in the art, its use of as much as 100,000 horsepower is discontinued by the Government, the Alabama Power Co. is to purchase and pay for the same in accordance with the schedule set forth in the license. This power to be the second 100,000 horsepower at any time available from the normal flow of the river. Then you speak of purchasing the Government's interest in the Warrior extension.

Now, as a member of this committee, I am looking at this proposition from the point of view primarily of national defense.

Mr. MARTIN. Yes.

Mr. HILL. But also having in mind the great demand on the part of the public for cheaper fertilizer; but to me this is primarily a national-defense proposition. This corps area here—the Fourth Corps Area—has always been a mobilization-camp section in every war we have had.

Mr. MARTIN. Yes; that is my understanding.

Mr. HILL. As I understand, Huntsville was a very important mobilization center in the Spanish-American War, was it not Mr. Chairman?

The CHAIRMAN. I do not recall.

Mr. MARTIN. That is correct, sir.

The CHAIRMAN. I recall there was a very big camp at Chattanooga.

Mr. HILL. Yes. Now, Mr. Martin, can you tell us what other big camps there were in what is now the Fourth Army Corps Area during the past war? There was Camp Greene, in North Carolina, was there not?

Mr. MARTIN. Yes; and there was a camp at Columbia, S. C., one at Atlanta, one at Columbus, Ga.; Camp Benning, I believe, is the name of that camp.

Mr. HILL. That is a permanent camp?

Mr. MARTIN. Yes.

Mr. HILL. How far are you from Camp Benning?

Mr. MARTIN. You will see that our lines on the eastern border of Alabama run to a point called Opelika, the extreme southeastern point of our line.

Mr. HILL. How near is Benning to your power-transmission line?

Mr. MARTIN. We go to a point known as Opelika, in Alabama, and Columbus, Ga., where this camp is located, is about 20 miles to the eastward of Opelika.

Mr. HILL. Then you are within serving range of Camp Benning, are you not?

Mr. MARTIN. We are, Mr. Hill; and it has been in discussion between our company and the Columbus Light & Power Co. that we would connect our lines at Opelika with the Columbus company to better serve the needs of that section of Alabama and Georgia, giving assistance to each company when it needs it, from one system to another; in fact, we are under an arrangement with them to go forward with that connection.

As you know, during the war, there was a very large camp at Montgomery. Camp Sheridan. Our company now has extended its lines and is serving power to the Montgomery district. We do not distribute there, but it is distributed by another company, the Montgomery Light & Water Power Co., and that company furnished all the requirements for lighting and power service at Camp Sheridan during the war.

Mr. HILL. Then your company during the war and at the present time is within serving distance of the majority of the great training centers in what is now the Fourth Army Corps Area?

Mr. MARTIN. Yes. Chattanooga is within easy distance. We have a tie-line connection with the Tennessee Power Co. which easily enables power to pass to Chattanooga for any purpose that might be required there.

Mr. HILL. Now, I am not entirely clear as to the difference between primary and secondary horsepower. In my questions that I asked Mr. Worthington I had in mind primary horsepower, because I had in mind that if the Government did not need all of this 100,000 horsepower for purposes of developing fertilizer it could use it in this corps area for lighting and for other purposes. Now, can you light lamps, etc., with this secondary horsepower?

Mr. MARTIN. Yes; of course.

Mr. HILL. What is the difference, in plain words, between primary and secondary horsepower? Is there any difference except the steadiness of flow?

Mr. MARTIN. That is all.

The CHAIRMAN. Mr. Hill, that has been explained in the record, but I have no objection to having it repeated at this time.

Mr. HILL. I wanted it in this connection because my understanding of it is—

The CHAIRMAN. It is already in the record, but I think it is probably fair that Mr. Martin should again explain what the difference is.

Mr. HILL. Then for all practical purposes primary and secondary horsepower are the same except in the flow?

Mr. MARTIN. Absolutely. It is just a question of river flow.

Mr. HILL. If the United States had available during the term of this arrangement 100,000 horsepower a year, that power could be used for lighting and heating or for any other purposes in these various camps, could it not?

Mr. MARTIN. Yes, Mr. Hill.

Mr. HILL. During the war you furnished electric power to Camp McClellan?

Mr. MARTIN. Yes.

Mr. HILL. Now, at war prices how much would 100,000 secondary horsepower be worth a year? Is that a fair question or is it the kind of question that could be properly answered?

Mr. MARTIN. Well, you would have to take into the question so many assumptions as to the place of delivery, the hours of use—

Mr. HILL. Let us take Camp McClellan as an illustration.

Mr. MARTIN. And the place of its delivery, etc. I might express it in this form: In times of war this power would be very useful, but you would want in addition to this power steam power or some other power to make it permanent. You would not want to be dependent necessarily on the flow of the streams in times of war. What would happen would be that you would exercise, or the President would exercise, some part or all the power vested in him under the terms of the Federal water power act and direct us to deliver any amount from Lock 12 or Mitchell Dam or the Tennessee River that might be needed for any of those locations.

The CHAIRMAN. Mr. Hill, will you allow me to ask a question there?

Mr. HILL. Certainly.

The CHAIRMAN. As I understand it, primary power is power that is always on tap.

Mr. MARTIN. Yes.

The CHAIRMAN. And secondary power depends upon the amount of water in the river, as to whether it is available or not.

Mr. MARTIN. Yes, sir.

The CHAIRMAN. Sometimes it is available for seven months, sometimes only for three months, and so secondary power changes in volume according to the amount of water on hand, is not that the case?

Mr. MARTIN. That is true.

Mr. HILL. And am I correct in my recollection that you said under these circumstances there would be about 82 per cent of secondary power available at most times in your testimony the other day?

Mr. MARTIN. Yes; that is correct. This 100,000 horsepower is available for 82 per cent of the time, taking an average period of 30 years, Mr. Hill.

Mr. HILL. That was my understanding.

Mr. MARTIN. There have been very fine and complete records made of this Tennessee River flow, as complete as any river in the United States, and they have been plotted.

Mr. HILL. Let me ask you this further question in that connection: Can you give the committee any estimate of about how much the value of this 100,000 secondary horsepower would be delivered, say, right at the nitrate plant, per year, because you have offered this as a sort of permanent payment per year?

Mr. MARTIN. It depends altogether on how the Government would wish to set it up. The Government might set it up at once price or another and might charge one price or another to its licensee. I noticed in some testimony which was offered and which I placed in the record the other day, that in former hearings before this committee one of the Government's consulting engineers placed a value in fertilizer production at this point on this power of \$7.53 per horsepower per year.

Mr. HILL. That would be \$753,000 per year.

Mr. MARTIN. \$753,000 a year. That was the average of the entire secondary power. Of course, this is—

Mr. HILL. (Interposing). From your testimony the other day this is practically all the secondary power that would exist at present.

Mr. MARTIN. It would be, with the equipment which we would initially put in, 240,000 horsepower, but there will be additional equipment until we finally reach 600,000 horsepower, the full installation, and everything above 100,000 horsepower is secondary, and the Government gets the first 100,000 horsepower.

Mr. HILL. The first 100,000 of the secondary power.

Mr. MARTIN. Yes.

Mr. HILL. Your proposition divides this up into a power proposition which in my opinion it is essentially.

Mr. MARTIN. Yes.

Mr. HILL. But it also takes care of the fertilizer end by setting apart not so much nitrate, but by setting apart so much power which can be converted into nitrate.

Mr. MARTIN. Yes.

Mr. HILL. Or sulphate, or whatever is necessary.

Mr. MARTIN. That is correct.

Mr. HILL. You offer therefore this guaranteed supply of power, which can be used for fertilizer, expressing it not in terms of nitrate production but in terms of power.

Mr. MARTIN. Yes.

Mr. HILL. And am I to understand that the value of that would be about \$753,000 a year?

Mr. MARTIN. The testimony, Mr. Hill—

Mr. HILL. Or would you prefer to go into that further and file a further report on that?

Mr. MARTIN. Well, I am not saying myself what the value would be for fertilizer production, but I am taking the testimony which is before the committee, and that was very exhaustively gone into at one of the earlier hearings, a hearing last year, and the value of \$7.53 was placed on that power during that hearing, and by \$7.53 I mean this entire block of secondary power. That which we offer the Government is 82 per cent of the time, then it reduces and goes down to 70 per cent, 50 per cent, 40 per cent, and 30 per cent. The gentleman who made the calculation as to the value of \$7.53 included all

of the secondary power over and above \$100,000, and placed the value of \$7.53 on it. Now, if you segregate the first 100,000 of secondary power from that volume you no doubt will find it has a very much better value than \$7.53.

Mr. HILL. Am I right in this interpretation or in this comparison of your offer and Mr. Ford's offer? Mr. Ford offers to take over this plant, the Government financing the completion of the dam.

Mr. MARTIN. You say our offer does that?

Mr. HILL. No; Mr. Ford's offer. Your offer contemplates your financing the completion of the dam.

Mr. MARTIN. Yes; that is correct.

Mr. HILL. Mr. Ford's offer contemplates taking over the title to Nitrate Plant No. 1 and Nitrate Plant No. 2, subject to certain reservations as to No. 2.

Mr. MARTIN. Yes.

Mr. HILL. You contemplate leaving that with the Government?

Mr. MARTIN. That is correct.

Mr. HILL. And you contemplate furnishing the Government power, which, translated into fertilizer, would perhaps be worth as much as \$753,000?

Mr. MARTIN. Or might be worth \$10 per horsepower or \$1,000,000 a year. It depends on the times and conditions and the price at which the Government sees fit to pass it on to its assignees. I have no doubt you would find that the Government could realize \$10 per horsepower.

Mr. HILL. Then under your offer you finance the water power development under the general water power act?

Mr. MARTIN. Yes.

Mr. HILL. And you leave to the Government its nitrate plants and guarantee it power?

Mr. MARTIN. Yes.

Mr. HILL. Whereas under the Ford offer, he takes the whole thing personally and the Government finances it.

Mr. MARTIN. That is my understanding, Mr. Hill.

Mr. HILL. Thank you; that is all.

Mr. MARTIN. As to this 100,000 secondary horsepower, under the calculations which have been made as to values heretofore by representatives of the Government, it might easily be expressed in terms of \$10 for the fertilizer business, which means \$1,000,000 a year, and over the period of years you have \$50,000,000 return to the Government in the form of power.

Mr. HILL. When is this secondary power more available, in the summer or in the winter?

Mr. MARTIN. Of course, during the winter months and the spring months the river runs high and the water is very high, and the low season months are September, October, and November.

Mr. HILL. Then suppose the Government should make this arrangement and should want this secondary power for use at Camp McClellan. It would be more needed in the winter months for lighting and heating than in the summer months.

Mr. MARTIN. Yes.

Mr. HILL. And naturally would be more available during that season of the year; is not that right?

Mr. MARTIN. That is correct.

Mr. HILL. In other words, under this proposition the Government would have available in this Fourth Corps Area this secondary power as its own and then would have the reserves of your company behind it for use in case of emergency.

Mr. MARTIN. Yes, sir. They would have all of those reserves, not only as a matter usually connected with the conduct of war but as a matter of contract, by virtue of the fact that we will have two licenses issued under the terms of the Federal water-power act, which impose that specific obligation upon the licensee.

Mr. HILL. As I understand Mr. Ford's offer, if a scheme could be devised by which the fertilizer equivalent of 110,000 tons of nitrate could be made out of 25,000 secondary horsepower a year, Mr. Ford would get all the remaining horsepower; in other words, his contract does not dedicate a specific amount of horsepower to this proposition, and I do not think his representatives have yet filed an answer as to whether Mr. Ford would be willing to do that.

Mr. MARTIN. I have not seen it, Mr. Hill.

Mr. HILL. And as the case now stands, yours is in terms of horsepower and his is in terms of nitrate.

Mr. MARTIN. Yes.

Mr. FIELDS. Mr. Martin, I would like to get a little more information with regard to the two local development companies that you referred to earlier in your testimony upon this subject. I believe you said there was a company organized at Muscle Shoals and a Birmingham company whose object it was to develop Cherokee Bluffs.

Mr. MARTIN. Yes, sir; that is correct, Mr. Fields.

Mr. FIELDS. And those companies were taken over by the Alabama Power Co.?

Mr. MARTIN. Yes, Mr. Fields.

Mr. FIELDS. By whom was the principal stock in those companies owned. Mr. Martin, before they were taken over by the Alabama Power Co.?

Mr. MARTIN. I would have to go back to the old records, Mr. Fields. There were a number of people owning them. Shall I go into all the details? I would be glad to, so far as my recollection carries me, Mr. Fields.

Mr. FIELDS. Was Mr. Washburn connected with those companies?

Mr. MARTIN. He was interested in both the Muscle Shoals Co. and the Cherokee Bluffs Co.

Mr. FIELDS. Was he a large stockholder in them?

Mr. MARTIN. Yes; he was a considerable stockholder.

Mr. FIELDS. It is a fact that Mr. Washburn manipulated the transaction which resulted in the Alabama Power Co. taking over those companies, is it not?

Mr. MARTIN. Well, I would not put it just in that form. I think Mr. Washburn was one of the principals in those negotiations. The negotiations with Mr. Mitchell came up first through others than Mr. Washburn. Those negotiations came up through a Mr. Paul Brady, who lives in the city of New York. He is the gentleman who initiated the program with Mr. Mitchell, and he was interested in the matter at the instance of some of his friends who owned some interest in the Alabama Power Co. at that time. Then Mr. Mitchell, having looked into the situation of the Alabama Power Co., became interested in these two other situations in a few weeks afterwards. Mr. Washburn was one of the principals in the negotiations in transferring the interests to Mr. Mitchell; Mr. Washburn and Mr. Henry C. Jones, of Montgomery; Mr. James S. Pinkhardt, of Montgomery; Mr. W. P. Lay, of Gadsden; and Mr. Hohenburg and Mr. J. W. Worthington and Mr. Charles H. Baker. They were the gentlemen, principally, with whom the transactions were conducted.

Mr. FIELDS. Mr. Worthington, to whom you have referred, did not own a majority of the stock or a great percentage of it, did he? He was only a light stockholder, was he not?

Mr. MARTIN. I do not recall just what his stock interests were. I do not recall that, and would have to look it up to see.

Mr. FIELDS. Have any other local power-development companies been taken over by the Alabama Power Co. or the Alabama Light & Traction Co. in the Southeast?

Mr. MARTIN. Yes; there were a number of companies operating in small towns and in the larger towns of Alabama, selling light and power to communities. We operate in about 60 different towns in the State, and at different times our company has taken over lighting systems in various parts of the State, and we have brought into those communities hydroelectric service and made available power for lighting and industrial use where it never existed before.

Mr. FIELDS. Was Mr. Washburn connected with any of those companies before they were taken over by the Alabama Power Co. or the Alabama Light & Traction Co.?

Mr. MARTIN. None except those I have mentioned.

Mr. FIELDS. You mean the two you mentioned a while ago before you mentioned the others.

Mr. MARTIN. Only the Muscle Shoals Co. and the Cherokee Bluffs Co. He was connected with those companies.

Mr. FIELDS. Earlier in your testimony you stated it would be inadvisable to attempt to manufacture all the fertilizer of the country in one place, and I realize the wisdom of your suggestion, but you will agree, will you not, that unless the manufacture of fertilizer by this process is started somewhere the farmers, if they are suffering by the prices now imposed upon them by the Fertilizer Trust, will continue to so suffer unless this is started somewhere.

Mr. MARTIN. In answer to your question I would say that it is my understanding of the testimony before this committee that this nitrate plant No. 2 can not manufacture a nitrate fertilizer and compete with either Chilean nitrate or the by-product, coke-oven ammonium nitrate. I can not undertake to speak as an expert, because I have not studied the question and am not an expert on the question. I am simply restating what has been mentioned

here. It is a matter for you gentlemen as to whether there can be any real competition between nitrate plant No. 2 and those other sources.

Mr. FIELDS. There has been testimony which claimed that it could be done more cheaply, and that testimony called attention to the fact that even a duty was asked in the last tariff bill against German nitrates, and our attention was further called to the fact that Sweden is now shipping plant food around through the canal and selling it to the farmers of California, and that is plant food manufactured in Sweden by the same process.

Mr. MARTIN. I think you will find, though, Mr. Fields, particularly in Germany, that it is the Haber process that is being used. I have in my hands a review of that question from Berlin under date of the 25th of February appearing in the New York Times, in which this statement is made with regard to the great Krupp plant:

"But it was particularly interesting to note that all these giant gun lathes were being operated to capacity on straight peace production. Instead of guns they were turning huge long seamless steel tubes for Germany's nitrate industry. The famous Haber process of employing nitrogen from the air in manufacturing nitrates requires these great steel tubes as long as the biggest extant ship's guns. Just how they function is a closely guarded secret of the nitrate industry. They are set up perpendicularly in pairs connected by shorter cross tubes, but beyond this even Krupp's experts profess to know no more about the synthetic nitrate industry."

All the information which I have, and speaking purely as a layman, is to the effect that that is the process which is going to be the real process by which the nitrate industry is going to succeed in this country and abroad.

Mr. FIELDS. Are you informed as to which process Sweden uses?

Mr. MARTIN. I understand it is the arc process.

Mr. FIELDS. That process is most like the Haber or the cyanamid process?

Mr. MARTIN. The difference, as I understand, between the Haber process and the cyanamid process is in the use of power. The Haber process uses very little power and the cyanamid process uses a great deal of power.

Mr. FIELDS. How is the process used in Sweden as compared with the cyanamid process?

Mr. MARTIN. The arc process?

Mr. FIELDS. Yes.

Mr. MARTIN. The arc process uses the most power of them all, and in point of units of production today, you will find the arc process is the least used.

Mr. FIELDS. But even that being true, Sweden is using that process and is shipping its products to the United States around through the Panama Canal and selling it to the farmers and fruit growers of California.

Mr. MARTIN. Yes; and they have practically no power cost, due to the exceptional conditions under which power development is made in Sweden.

Mr. FIELDS. Of course, they are situated like we are with regard to Muscle Shoals and many other splendid water powers. They have very splendid water powers there.

Mr. MARTIN. With high heads and great rivers they are able to develop their powers at very much less cost than we can ever develop ours, at at least, some of them.

Mr. FIELDS. It has apparently been the policy of the Government for several years, beginning with the consideration of the national defense act of 1916, to provide some place for the production of nitrates for war purposes in times of stress and for fertilizer in times of peace, and it appears further that the Government settled upon Muscle Shoals as the place to carry on that production; but it seems to me, considering the proposition of the Alabama Power Co. in the light of the opinion expressed by the Secretary of War in his letter to the Congress accompanying the offer of the Alabama Power Co., that we see the finish of this policy, if the offer of the Alabama Power Co. is accepted and the recommendations of the Secretary of War as expressed in paragraph 2 of his letter, to which I have referred, are carried out.

Mr. MARTIN. On the contrary, it would seem to me, Mr. Fields, that it makes it more practicable.

Mr. FIELDS. In paragraph 2 of the letter referred to, the Secretary says:

"The company offers to furnish the Government, or any one it may designate, with free power in the amount of 100,000 secondary horsepower for the production of fertilizer and munitions of war and research in connection therewith; and if for any reason this use of the power is discontinued, the company will purchase same. The feature of the offer has the advantage of pro-

viding the Government a return on the \$17,000,000 it now has invested in the water-power project."

So I understand from the Secretary's letter that he is looking at the return that would come to the Government by the Alabama Power Co. purchasing this project and paying for it, which payment would be applied as a return upon the \$17,000,000 invested in the dam.

Mr. MARTIN. The Government gets a return, may I suggest, Mr. Fields, in that it receives 100,000 horsepower, whether it puts it into fertilizer production, munitions of war, or sells it; in either case, the Government gets a return. Now, I do not know just in what sense it was intended here, but it seems to us that the Government is definitely getting a return on its wartime investment, whether it converts that power into fertilizer or sends it out for commercial or other uses.

Mr. FIELDS. That might be your construction of that paragraph of the Secretary's letter, but I am frank to say that it is not my construction of it.

Now, in order to try to arrive at a conclusion as to where the Government is getting on and off in these two propositions, I have tried to figure out, as best I could, the return that the Government would get under each one, and in that calculation I have been more liberal than you were in your estimates made in reply to the questions of Mr. Hill a while ago. I took the estimate of Col. Cooper on the value of power at Muscle Shoals. I believe he placed an estimate of 1.2 mills per kilowatt hour, which would amount to \$7.80 per horsepower.

Mr. MARTIN. For secondary power.

Mr. FIELDS. Yes; for secondary power.

Mr. MARTIN. What load factor do you use?

Mr. FIELDS. I have figured it out on 100 per cent load factor, and also upon what the testimony shows is the average load factor used in the United States. If the flow of the river would provide continuous power at \$7.80, that would amount to \$780,000 a year, and I believe you suggested a while ago that the flow of the river would afford that power about 80 per cent of the time.

Mr. MARTIN. Eighty-two per cent of the time.

Mr. FIELDS. In the calculation which I made last night and have roughly revised here, for 10 months, that would amount to \$650,000 on a 100 per cent load factor, and on a 51 per cent load factor, which the testimony shows is the average load factor in all operations of this character, it would amount to \$331,500, and comparing your contract with the life of the Ford lease, the Government would get a return there of \$33,150,000. Now, what other return does the Government receive under your offer?

Mr. MARTIN. We will have to go back to your hypothesis a moment. The very price of \$7.80 per horsepower per year is predicated on the secondary class of power and does not vary, due to the question of load-factor use. All of those factors you have taken into account, if I may suggest, Mr. Fields, when you reached the figure of \$7.80 per horsepower per year were taken into account, and taking your basis of \$7.80, that becomes \$780,000 a year, rather than \$330,000 a year.

Mr. FIELDS. All right: I will admit my inability, with my limited knowledge of the power business, to figure out in a few minutes or to take into consideration all these things to which you refer, but let us take it on the broadest possible basis that we can make it and put it on 12 months a year, with 100 per cent load factor; that would be \$780,000 a year, or \$78,000,000 for the life of the contract, using the same length of time as is contemplated in the Ford contract.

Mr. MARTIN. Yes, sir.

Mr. FIELDS. And that is as broad as you can possibly make it, and that is giving you every advantage and is conceding that the river flows 12 months out of each year for the 100 years?

Mr. MARTIN. Oh, no.

Mr. FIELDS. So as to furnish this 100,000 horsepower, giving you a load factor of 100 per cent.

Mr. MARTIN. We can not concede that it will flow 100 per cent of the time.

Mr. FIELDS. I know we can not, but I am giving you the advantage of that. I am conceding that only for argument's sake and am giving you that advantage.

Mr. MARTIN. We do not want the advantage, and we do not need the advantage. We do not need that assumption. We take 82 per cent of the time and that fixes the basis, and that is all we can assume. We go by the records of 30 years, and if you will go into the power business you will find that these records of 30 years are going to work out in practice, and the gentlemen

who figure out this power situation on the Tennessee River do so upon those same records. Now, taking that basis as a starting point, without any advantage given to us—and we do not think we are entitled to any advantage—82 per cent is the basis. Then you have the question of 50 times \$780,000 in the 50-year period, or \$39,000,000, and in a 100-year period you have \$78,000,000. That is the advantage to start with.

Mr. FIELDS. That is on a 100 per cent load factor for continuous power?

Mr. MARTIN. No.

Mr. FIELDS. I beg your pardon.

Mr. MARTIN. No; that is secondary power.

Mr. FIELDS. I think if you will look into it you will find that is at \$7.80 per horsepower, and I am basing my calculation upon the figures given by Col. Cooper for continuous flow.

Mr. MARTIN. I do not know of anyone, Mr. Fields, in the United States that would sell you continuous horsepower at \$7.80 per horsepower per year.

Mr. FIELDS. You think that is too high?

Mr. MARTIN. No, sir; it is too low.

Mr. FIELDS. That is the figure that Col. Cooper gave.

Mr. MARTIN. That is for secondary power?

Mr. FIELDS. Yes; for secondary power, and I say, granting that the flow of the river is so continuous that it will furnish this secondary 100,000 horsepower continuously—

Mr. MARTIN (interposing). For 82 per cent of the time.

Mr. FIELDS. But if it does that for 100 per cent you can not figure out more than \$780,000 a year, which would be \$78,000,000 for a period of 100 years, which is equal to the period of the Ford lease.

The CHAIRMAN. Mr. Fields, will you allow me to ask a question there, and maybe I can clarify the situation? If power is furnished 100 per cent of the time, it is no longer secondary power.

Mr. MARTIN. That is correct, Mr. Chairman, and that is the answer.

Mr. FIELDS. I understand that thoroughly, but I was just making it as broad and as much in favor of the Alabama Power Co. as I could, to show what the maximum could possibly be. Then at the end of the contract you own the property under the terms of your contract, as I understand, with the right of the Government to recapture?

Mr. MARTIN. Yes; Mr. Fields, at the end of 50 years, or during the 50-year period, the licensee owns the property. If it greatly increases in value, and it is bound to increase in value, at the end of this 50-year period the Government may come in and take it over on paying the licensee his original cost, whatever in dollars that project has cost to the end of the 50-year period, without any increment or anything representing this increase in value, and even the lands, rights of way, water rights, and intangibles of that character, going value, good will, all of those elements, by the terms of the Federal water power law are excluded, except the actual, reasonable cost of those things to the licensee, so you come back at last to the net dollars the licensee has in the project, and that is the basis on which the Government may take it over.

Mr. FIELDS. But the Government must pay the licensee the value of the property as defined by you in your statement.

Mr. MARTIN. I would not say value, but the cost.

Mr. FIELDS. Yes; the cost.

Mr. MARTIN. Yes; what is known in the Federal water power act as "net investment."

Mr. FIELDS. Then in arriving at just how the Government is going to come out, we would deduct that cost from the Government's income from the Alabama Power Co. during the life of the contract.

Mr. MARTIN. No; because the Government has not suffered that at all. We do not ask the Government to put up that net investment. We advance that net investment you see. It is not a deduction. The Government has saved the net investment.

Mr. FIELDS. But the point I am getting at is that the Government would own the property at that time with its income from the Alabama Power Co. during the life of the contract, less the cost of the construction which the Government would have to pay back to the Alabama Power Co.

Mr. MARTIN. Yes; in the intervening period the Government is better off because it has saved this investment itself. It has saved the annual interest charge on that investment, which you can calculate very easily, and at the end of this period, the Government may do exactly what it may do to-day, without

any added cost, namely, come in and pay the net investment to the licensee and take it over.

Mr. FIELDS. I understand, but you are not contending—I hope that the Government could recapture the property and own it in fee, and at the same time have all the income that it gained from the Alabama Power Co. during the life of the contract.

Mr. MARTIN. Yes.

Mr. FIELDS. It would have to pay the Alabama Power Co. for the property which would naturally, in the final balance, be deducted from the amount the Government had gotten from the company.

Mr. MARTIN. It would only pay that which the Alabama Power Co. had contributed in the meantime toward the capital cost of the project.

Mr. FIELDS. But you will not claim that it would own the property and still have all the income that it received.

Mr. WEATHERS. The property now there.

Mr. FIELDS. Of course, it would own the property now there. It owns it anyhow, but with the improvements put on by the Alabama Power Co.—

Mr. MARTIN (interposing). The Government would take over the improvements and everything we put there.

Mr. FIELDS. And pay you for putting them there?

Mr. MARTIN. And pay our net investment.

Mr. FIELDS. If it had \$78,000,000, which I reach by allowing you 100 per cent time and 100 per cent load factor, it would, of course, deduct whatever amount that was, and the Government would say that I have the contract and have so many dollars that I have acquired.

Mr. MARTIN. That is one way of looking at it; in other words, if the Government has realized this income of \$40,000,000, we will say, from power in the meantime it may turn back and use the \$40,000,000 income in paying the net investment and take it over without any cost, if that is what you mean.

Mr. FIELDS. And I have figured all the advantage that could come to the Alabama Power Co. by reason of the 100 per cent time and 100 per cent load factor. Now, taking it on the other hand, for 100 years on 10 months' time and 51 per cent load factor, and I figure on 100 years, because that is the period equal to the period of the Ford lease—the Government would receive from you \$33,150,000.

Mr. MARTIN. No; we can not agree as to how the question of load factor applies. I think we misunderstand each other there.

Mr. FIELDS. I am taking the benefit of each extreme. It would come somewhere between those figures, and would be somewhere between \$33,150,000 and \$78,000,000. It could not go outside of those two limits.

Mr. MARTIN. I do not quite understand your figure of \$33,000,000.

Mr. FIELDS. That is the lowest it could possibly go, as I see it; and the other is the highest it could possibly go, granting you 100 per cent time and 100 per cent load factor.

Mr. MARTIN. No; you must remember that the price of power is increasing, too. The value of power is increasing; and, whereas it may be worth \$7.53 to-day, it may be worth twice that amount 50 years from now.

Mr. FIELDS. Of course, we can not figure what the price of power will be 50 years from now, and we have to figure it on the price to-day. For argument's sake, I shall not refer further to the 10 months' flow and 51 per cent load factor, I am going to make it 100 per cent time and 100 per cent load factor.

Mr. MARTIN. Then your power is worth \$25 per year, because you get primary power then, Mr. Fields.

Mr. FIELDS. But we must take into consideration here the element of secondary power, because that is what we are figuring on.

Mr. MARTIN. Then, we will go back to \$7.80 per horsepower per year.

Mr. FIELDS. That will cut you below \$78,000,000 a year.

Mr. MARTIN. I do not see how it can.

Mr. FIELDS. Because you are paying the Government in secondary power. You are not paying the Government in primary power. I only gave you that advantage of 100 per cent time and 100 per cent load factor in order to go to the very last limit that could be reached in your favor, and upon that basis, in the life of the contract of 100 years, the Government would recover from the Alabama Power Co. \$78,000,000, and, then, would have to pay the Alabama Power Co. for what it has put into the construction work, which would be deducted from that amount.

Mr. MARTIN. Now, we will take your assumption of 100 per cent river flow and this power being available 100 per cent of the time; that is, this 100,000 horsepower.

Mr. FIELDS. Yes.

Mr. MARTIN. Then you are dealing with power which to-day has a market value of \$25 per horsepower per year or \$2,500,000 a year, and in 100 years you have \$250,000,000. You are then dealing with figures which carry you to \$250,000,000.

Mr. FIELDS. Then let us deal with figures which can not possibly carry us beyond the real of secondary power. Let us take it at 10 months in the year with 100 per cent load factor; that would amount to \$650,000 a year, or \$65,000,000. That brings us within the limits of secondary horsepower. I will meet you on that proposition. At the end of 100 years the Government will have recovered from the Alabama Power Co. \$65,000,000. Now, if it recaptures the property, it must pay for what you have put into the property, which would be deducted from the \$65,000,000.

Mr. MARTIN. That is a matter of bookkeeping, of course.

Mr. FIELDS. And the Government would stand then with one dam, losing the use of navigation on the Tennessee River for the 100 years, because Dam No. 3 is not completed and not contemplated in the contract upon which we are basing these figures. The Government would have \$65,000,000 from the Alabama Power Co. less what the Alabama Power Co. put into the construction of Dam No. 2, and the Government has \$17,000,000 in there now, and it has had that amount in there during all of this time we are speaking of.

Under the Ford offer, we put in \$42,000,000 additional and we recover from Ford the amortization fund of \$49,000,000 and \$161,000,000 in interest, or a total of \$260,000,000 as against \$65,000,000.

That is \$260,000,000 as against \$65,000,000, and we get from Mr. Ford \$260,000,000 and own Locks 2 and 3, and the benefits we have had of a navigable river for a hundred years.

Mr. MARTIN. Yes; but how much are you out in doing that?

Mr. FIELDS. Forty-two million dollars, in addition to what we would be out in supplying the Alabama Power Co.

Mr. MARTIN. No; you are out \$1,275,000,000 on your basis of calculation, on 100 years, in doing that.

Mr. FIELDS. No; if we go back that far you want 4 per cent on the \$17,000,000.

Mr. MARTIN. We are willing to balance figures on that, and the Government must credit itself with the annual savings which it otherwise be out to the bondholders, because the Government does not have any additional money to put out in the 100 years under our program.

Mr. FIELDS. It has the \$17,000,000 in the dam?

Mr. MARTIN. We will let you make that calculation and give the Government credit. The Government must charge itself this annual return in the form of the value of this power. It has that income, and it has no outgo by way of interest charges or any further investment in it. It is saving to the Government over the period of its net annual charge for maintaining and operating these dams and gates as is not done in the case of another proposition.

Mr. FIELDS. Mr. Ford provides for payment of \$55,000 a year, so that those two things balance one against the other.

Mr. MARTIN. If you will look at Col. Cooper's estimate, you will see that that amount is vastly insufficient to take care of those annual charges.

Mr. FIELDS. Right there, since you have referred to Col. Cooper's estimate, of course, I understand you are basing your calculation on the same premise that Col. Cooper uses, that the Government should charge 4 per cent interest on everything it puts into those charges.

Mr. MARTIN. You are doing that.

Mr. FIELDS. Would you apply that to all irrigation and river and harbor projects? The Government has not yet adopted that policy. It seems to me that any calculation we can make must be based upon the policy of the Government at this time, and the Government has no such policy at this time.

Mr. MARTIN. I will accept your premise and answer you by saying that if that is not the policy of the Government, neither can you say that an annual fund of \$55,000 could be credited with an annual interest of 4 per cent for 100 years. If you are going to adopt that policy, then apply it consistently. How can you create an amortization fund and put it on the books of the Government at 4 per cent and say in 100 years it is going to amortize the principal unless you have the policy?

Mr. FIELDS. Under the Ford contract we would have navigable water on the Tennessee River for 100 years, and that would be worth something, would it not?

Mr. MARTIN. It will be worth something, and we will go ahead right now, Mr. Fields, and pay you more interest than you would otherwise get if you would put up the money to build Dam No. 3, and we will take it over and maintain it and operate and pay you more interest than anybody else has offered to pay you.

Mr. FIELDS. It is strange you did not include that in this offer.

Mr. MARTIN. We have not asked for Government money, but we are willing to privately finance it whenever business conditions in this territory will justify the private financing of this project. In the course of 10 years it will be built, and in another program, which is before you, it is not going to be built within 6 or 7 years; you will not get around to it under 6 or 7 years, and in 10 years it can be privately financed.

Mr. FIELDS. The only way you can discredit the comparison I have drawn is to charge 4 per cent interest for 100 years on all the money the Government puts into the proposition.

Mr. MARTIN. I am not discrediting that at all, Mr. Fields, I am merely saying let us be consistent. If you are going to say the Government has an annual outgo, and there is a balance against the Government annually—is not that true? There is a balance against the Government every year between its income and outgo?

Mr. FIELDS. Yes; I assume that is true.

Mr. MARTIN. We propose that the Government shall not have any outgo.

Mr. FIELDS. It already has an outgo of \$17,000,000.

Mr. MARTIN. We propose to give you a return on that, and we stop right there with the outgo.

Mr. FIELDS. If we charge you that 4 per cent interest on the \$17,000,000 that will result in quite a different figure so far as concerns what the Government receives from the Alabama Power Co. at the end of 100 years.

Mr. MARTIN. Taking your figure at \$7.80, what is 4 per cent on \$17,000,000? It is \$680,000 a year, and according to the figures you have used, the \$7.80, the Government will get over 4 per cent out of this \$17,000,000 annually. You have over \$100,000 more than your annual interest charge. You have got to give the whole situation that credit as you go along.

Mr. FIELDS. Upon the same proposition, by putting in the additional \$42,000,000 received from Mr. Ford, we will get there, from you, on a 10-month's flow and a 100 per cent load factor, which I am only conceding for the sake of the argument—we would get \$650,000 a year, and that would be \$65,000,000 during the period of 100 years, and that is all we would get from you, and if we recapture the property we must deduct from that the amount you have put into the property. Then we have been giving you the benefit of a Government contract for 100 years, whereas under the Ford proposition we have already got \$17,000,000 in the plant, and by putting in \$42,000,000 we would have a navigable river for 100 years and the nitrate plant maintained at an expense of \$3,500,000 a year; that is, a deterioration of 5 per cent, and an account for maintenance, which the War Department figures at \$200,000 a year, and \$260,000,000 from Ford in interest and amortization fund. So it looks to me like there is a wide difference between the two propositions, if I am correct. And I want to be correct on this proposition; I want the facts.

Mr. MARTIN. Let us take navigation.

Mr. FIELDS. That is not accounted for in the Ford proposition.

Mr. MARTIN. When we come to the question of navigation, it is more complex, and it is important. In order to get the navigation complete you have to build Dam No. 1; that is, below the Wilson Dam.

Mr. FIELDS. It has been estimated it will cost \$1,400,000 to do that.

Mr. MARTIN. That is not involved in this situation at the moment. That is an appropriation which you must make independent of this matter. Then you have the Wilson Dam as a part of the navigation scheme. It will carry the water back 17 miles. Then you have to build Dam No. 3 to carry that navigation back, I think, 65 miles. Then you have to build from five to seven more dams in the next stretch of the river between the headwaters of Dam No. 3 and Hales Bar on the Tennessee River to make your all-round navigation. I do not know what those estimates are; perhaps they amount to ten or fifteen million

dollars. You have all those things to do. What I say is that then Dam No. 2 can be taken care of by financing in the usual business way of inviting capital to come in to do it. Dam No. 3 can be taken care of in the same way. The Government probably will find it necessary to finance these other dams on that river because the water power does not justify privately financing other water powers on that river.

When you come into the question of navigation you have to consider it as a whole. By building Dam No. 2 and Dam No. 3 you do not complete the scheme of navigation, but it would be a matter of millions of dollars which would have to be put into those other dams.

Mr. FIELDS. While it does not appear in the Ford offer, Mr. Ford's engineer has stated that it is Mr. Ford's intention to build these dams in the upper reaches of the river.

Mr. MARTIN. I am not speaking of the upper reaches; I am speaking of the stretch from Chattanooga to Muscle Shoals. You will find you have to do a great deal of river improvement in that stretch.

Mr. FIELDS. But Dams Nos. 2 and 3 will put us into the heart of the raw-material regions there, will they not?

Mr. MARTIN. No; it will improve a stretch of the river, just as Dam No. 2 improves a part and also Dam No. 3 will improve a part.

Mr. FIELDS. Dam No. 2 would put the water back 14.7 miles and Dam No. 3 would put it back 63 miles.

Mr. MARTIN. Then, you have to build the other dams before the navigation scheme is completed.

Mr. FIELDS. It is fair to say that the completion of Dams. Nos. 2 and 3 will make quite an improvement in the navigation of the river by carrying it over Muscle Shoals, which has always been a great impediment to the river.

Mr. MARTIN. You will find on examining the profile of the river as shown in Document 1262, Sixty-fourth Congress, first session, plate No. 1, that the scheme of improvement requires several dams between Dam No. 3 and Hales Bar. Hales Bar is the large dam built just below Chattanooga.

Mr. FIELDS. How far is it from Dam No. 3 to Hales Bar?

Mr. MARTIN. About 150 miles.

Mr. FIELDS. How many locks are recommended by the Government engineers from Dam No. 3 to Hales Bar?

Mr. MARTIN. They are Hobbs Island Dam, Buck Island Dam, Mink Creek Dam, Bellefonte Dam, and Widows Bar Dam—that is five dams in that stretch, and that will carry the water level to the Hales Bar Lock and Dam.

Mr. FIELDS. It will provide for a 6-foot draft. But the river, in the absence of these dams, is navigable a great portion of the year, or would be navigable a great portion of the year if Muscle Shoals were supplied with Locks 2 and 3. would it not?

Mr. MARTIN. Yes; that is correct, if you also add Lock No. 1. I believe the Widows Bar Dam is now under construction, or at least one of those dams is now under construction. Of course, the navigation question is itself important and if the Wilson Dam is completed, somewhere along the lines we have suggested, by a licensee under the Federal water power act, in the course of five years' private capital will be ready to undertake the next one, because of the power feature of the project, and if the Government wants to undertake that one to-day, on a basis which is better than anything that has been proposed, the Government can do it to-day. All of those interest charges that the Government is now proposing to meet on this \$50,000,000 of new capital; you have to bear in mind you have to balance that in the whole equation to see where the Government comes out.

Mr. FIELDS. Of course, if we follow the figures suggested by you and Col Cooper the Government has got to depart from its policy.

Mr. MARTIN. I am speaking of the \$50,000,000 of new money; excluding the amount of interest you have \$50,000,000 of new capital to put into these two developments now.

I would like to say the completion of the Wilson Dam with a lock restores navigation upon that river as it existed before the dam was constructed; in fact, it improves the condition of things. There is a canal which has long been in existence, and which goes around the remainder of the Muscle Shoals district. Carrying the improvement then from the upper river into the pool created by the Wilson Dam you get exactly the same navigation with the Wilson Dam completed; in fact, you get greatly improved navigation with the Wilson Dam completed over that which existed before the dam was begun.

Mr. FIELDS. You have a pool for 14 miles above, and when you get up there you are no better off.

Mr. MARTIN. There is a Government canal there.

Mr. FIELDS. Your statement suggests another question. I believe in your proposition you propose to operate the locks during the period of your contract, whereas Mr. Ford proposes to make a cash allowance to the Government of \$55,000 a year for the operation of the locks.

Mr. MARTIN. No. Here is the situation: We do not propose to operate the locks, and neither does Mr. Ford. We propose to furnish power to operate the locks, and so does Mr. Ford. We propose to maintain the power house and dam. In the case of the Ford proposal, he proposes to operate the power house and maintain the power house. Our proposal goes further, and we undertake to operate and maintain the dam gates in addition. Mr. Ford proposes to give you a fixed sum of \$55,000 a year. We propose to undertake the full burden and the hazard.

Mr. FIELDS. But the difference there is this: The expense of operating these gates with Dam No. 2 only constructed would not be as great as if Dam No. 3 were also constructed, would it?

Mr. MARTIN. I do not know that it makes any great difference as to the risk. It is a matter of risk. Do you mean—

Mr. FIELDS (interposing). I mean the actual expenses of operation, of doing it.

Mr. MARTIN. I can not see that it makes very much difference.

Mr. FIELDS. There would not be very much navigation.

Mr. MARTIN. We are speaking of two different things, are we not? The expense of operating a lock is in any case an expense for the Government to take care of. The expense of operating and maintaining the dam and the gates on the dam, not the lock gates, is a thing which is wholly outside of the question of navigation whether No. 3 is in or out.

Mr. QUIN. Mr. Martin, these questions I am going to ask you are based on the fact that we are considering you as an outsider, the same as Mr. Ford, in this proposition. This is an affirmative offer of yours, and of course the question of the contract would be irrelevant here. But I think it is necessary for the record to show who your company is for the benefit of our colleagues who are not here.

You admit, and Poor's Manual shows, that the Alabama Power Co. is owned by that Canadian corporation called the Alabama Traction, Power & Light Co. (Ltd.): Is that correct?

Mr. MARTIN. Not expressed just in that language. The ownership of a company is represented by its securities, whether they be stock or whether they be bonds. We have outstanding large issues of bonds and stock. Taking those security issues as a whole, there are largely more outstanding bonds and obligations of that character than of stock, and about 65 per cent of our company is owned in America and 35 per cent abroad, as I stated the other day.

Mr. QUIN. Poor's Manual on public utilities shows that all of the common stock and the voting stock of the Alabama Power Co. is owned by this Canadian corporation I mentioned.

Mr. MARTIN. I do not think it is exactly expressed in that way, because it is not quite correct.

Mr. QUIN. Wherein have I misstated it?

Mr. MARTIN. We have some 15,000 or 20,000 shares of 7 per cent preferred stock, which ranks *pari passu* with the common stock, which ranks in all other respects with other stock except that it is preferred in dividends. There is a very large part of our preferred stock held by the public in Alabama. It ranks along with the common stock. In addition to that you will find in Poor's Manual information about our other security issues, other than stock.

Mr. QUIN. What stock votes?

Mr. MARTIN. The preferred and the common stock votes. Under our charter the preferred stock votes identically with the common.

Mr. QUIN. How much common stock have you outstanding?

Mr. MARTIN. Our common stock outstanding amounts to \$18,751,000.

Mr. QUIN. How much preferred stock?

Mr. MARTIN. It is about \$2,000,000.

Mr. QUIN. Then you have about \$16,000,000, approximately, more in common stock than in preferred stock?

Mr. MARTIN. Yes.

Mr. QUIN. With that understanding—

Mr. MARTIN (interposing). That common stock is voted—the direction is given for voting that stock, Mr. Quin, by a board of directors of the Canadian company, although as I recall, Mr. Quin, either 9 or 10 of them live in this country and 3 live abroad. So it is entirely in the control, or three-quarters of the membership of the board who control this stock are American citizens. A majority of the directors of the Alabama Power Co. live in the State of Alabama.

Mr. QUIN. What is the function of the Canadian corporation mentioned; what does it do; what line of activities is it engaged in?

Mr. MARTIN. It came about, Mr. Quin, because when we began this work in 1912 we could not get the American investor to put his money into the enterprise. We had to get money to go forward. Then we organized a company in Canada which might issue its securities, and its securities would be issued in a form to appeal to an English or foreign investor, wherever he might be. But it was a vehicle through which we were to obtain funds, anyone who might desire to invest in those securities. Those securities were issued and sold and funds obtained for that purpose by that Canadian company down to the outbreak of the World War. At the outbreak of the World War, or after the outbreak of the war, we had to entirely change our program, because we could not get money from abroad for American enterprises. After the World War we reorganized the position of the companies so far as it involved the obtaining of funds, and our securities since then have been entirely sold in America, so that to-day the situation is just the reverse of the situation as it existed in 1914.

Mr. QUIN. What other function does this Canadian corporation I have referred to perform?

Mr. MARTIN. None. It is really a company which has no function in the situation at the moment.

Mr. QUIN. It is a holding corporation?

Mr. MARTIN. It was organized with that view, and with the view of obtaining funds with which to make these investments in Alabama.

Mr. QUIN. Coming to your proposition, you start out with an offer of \$5,000,000 for the Government's equity in the Gorgas transmission line, erected at a cost of \$4,670,000, for the steam plant No. 2, which cost \$12,328,392, and for the \$17,000,000, which was the amount the Government expended on Dam No. 2, or the Wilson Dam. That aggregates a cost to the Government of \$34,002,892. To take that over you offer—and, by the way, there is more in that. You include the construction plant, and, of course, include the equipment the Government has at Dam No. 2.

Mr. MARTIN. That is part of the \$17,000,000.

Mr. QUIN. That is a part of that, and is not aside from it?

Mr. MARTIN. No.

Mr. QUIN. The Government figures two or three million dollars worth of tools and equipment in that plant in the \$17,000,000?

Mr. MARTIN. Yes.

Mr. QUIN. There is no doubt about that?

Mr. MARTIN. The record shows everything the Government has expended in that situation as represented by \$17,000,000, whether it be the construction plant or a permanent property, wherever it is. You spoke of \$4,000,000 representing the cost of the transmission line.

Mr. QUIN. I said the Gorgas plant and transmission line, the Government's equity in that. That is what they say.

Mr. MARTIN. I accept your figures of \$34,000,000 as representing the Government's investment, or the Government's war-time investment in those projects. Let us see on the other side what you get. You get \$5,000,000 in money; you get 100,000 horsepower.

Mr. QUIN. Let me bring that out, because I want the record to show—

Mr. MARTIN (interposing). Then I can not answer your question.

Mr. QUIN. But I am going to be fair with you. I want to analyze it in my own way. That represents the outlay the Government made; whether it is worth it or not, we are not passing on at this moment.

Then you are to construct at the Government's expense a lock at Dam No. 2, according to your offer?

Mr. MARTIN. Yes.

Mr. QUIN. Col. Cooper estimated that to be \$4,500,000. Let us assume that is correct. It may take the whole \$5,000,000.

Mr. MARTIN. If you are willing to agree on what it will cost, I will agree with you that it will cost less than \$4,500,000.

Mr. QUIN. Let us take the estimate to which he testified. Was he not the engineer who designed the dam?

Mr. MARTIN. I do not know; but that possibly included the locks at both No. 2 and No. 3.

Mr. QUIN. No; we have another lock up there, and whatever the estimate was as to what it would cost for navigation, is immaterial here.

Mr. MARTIN. I think you will find that the estimate of the Secretary of War is \$2,500,000, as I recall.

Mr. QUIN. I think, of course, that Mr. Cooper was rather extreme in his figures.

Mr. MARTIN. We are willing to trade on your figures, but we think the Government would come out a lot better if you would leave that to the engineers. I think you will find it will be nearer the Secretary of War's figures of \$2,500,000.

Mr. QUIN. I hope it would; but Mr. Cooper was very positive in his statement before the committee. If he is correct, then there would be \$500,000 which the Alabama Power Co. would owe the Government. When would you start to pay that? The natural presumption is it would be after the completion of the lock, would it not?

Mr. MARTIN. I think it is most likely we would pay the whole amount immediately, because that is the way we would have to finance it.

Mr. QUIN. You mean before you started?

Mr. MARTIN. Yes.

Mr. QUIN. You would be doing an entirely new thing in financing, would you not?

Mr. MARTIN. I think that is the way it would work out.

Mr. QUIN. That would not be a good business way to proceed, would it, when you can not tell definitely what it would cost for the lock?

Mr. MARTIN. My idea is we will agree with the engineers on what the cost would be, what really represents the cost of the locks. The Government engineers say the cost is \$2,500,000, and if we agree on that cost of \$2,500,000, that settles the question. We would pay the balance as soon as we undertook the work.

Mr. QUIN. Then the Government would be required to give you title to all its equity in the Gorgas steam plant, the Warrior plant, and the transmission line to Muscle Shoals. It would be required to give you title to the steam plant No. 2 at the nitrate plant at Muscle Shoals. It would be required to give you title to Dam No. 2, or the Wilson Dam, would it not?

Mr. MARTIN. No; Mr. Quin. As a matter of good business, I am sure the Government engineers and its counsel would not transfer the title until the purchase money was completely paid.

Mr. QUIN. I am not speaking of that; that is your proposition.

Mr. MARTIN. But the title will pass only from the Government on payment of \$5,000,000, or the balance that may be due.

Mr. QUIN. This is what you say in section 5 of your offer, on page 4: "The Government to transfer to the licensee the Wilson Dam property represented by its investment and commitments to date, free of liabilities and unincumbered, including the construction plant. The locks and navigation structures to be conveyed to the Government in fee on completion of construction. That same language applies to these other plants, does it not?"

Mr. MARTIN. No. You will find here, that while it is not expressed in terms of the legal, final terms, unquestionably the Government would not convey its property under paragraph 3, the steam plant property, until the full purchase money is paid.

Mr. QUIN. I am assuming you are going to pay the money; that is a requirement in the Alabama Power Co.'s proposition.

Mr. MARTIN. We do not ask for any title until we pay.

Mr. QUIN. I am assuming you are paying cash, and when that cash is paid—

Mr. MARTIN (interposing). Then we take the title.

Mr. QUIN. You have the title to all these properties I named, and the only thing the Government has left is nitrate plant No. 2; is that not true?

Mr. MARTIN. No. 1 and No. 2.

Mr. QUIN. If Col. Cooper's assumption is correct, the Government would get \$500,000 in cash and you would get all those properties, and in addition to that you would give the Government 100,000 secondary horsepower for the term of 50 years. That is your proposition?

Mr. MARTIN. No. In the first place, you have to remember—I believe if you will look at Mr. Cooper's testimony; I do not recall one way or the other, but I do not think it is possible that his testimony shows that the locks at Wilson Dam will cost \$4,500,000.

Mr. QUIN. I may be wrong about that; but if I am wrong, I will assume that, anyway.

Mr. MARTIN. Why not assume it to be \$10,000,000 or \$15,000,000?

Mr. QUIN. There is no testimony of that kind.

Mr. MARTIN. The testimony of the Secretary of War is that it will be \$2,500,000.

Mr. QUIN. He is like us, he is a layman, and he must have gotten his information somewhere else.

Mr. MARTIN. If the Government does not want to put in the lock the Government gets the full \$5,000,000; that is all. The Government does transfer the title to this steam plant and equipment on the payment of \$5,000,000, or the balance of \$5,000,000. It does transfer also the Wilson Dam property; but I would like for you to take into account at this moment section 13 of the Federal water power act of June 10, 1920, which fixes the liabilities and conditions under which a licensee shall commence and complete construction of a project. I will hand that section to the reporter so that it may be set out in the record.

(The section referred to is as follows:)

"SEC. 13. That the licensee shall commence the construction of the project works within the time fixed in the license, which shall not be more than two years from the date thereof, shall thereafter in good faith and with due diligence prosecute such construction, and shall within the time fixed in the license complete and put in operation such part of the ultimate development as the commission shall deem necessary to supply the reasonable needs of the then available market, and shall from time to time thereafter construct such portion of the balance of such development as the commission may direct, so as to supply adequately the reasonable market demands until such development shall have been completed. The periods for the commencement of construction may be extended once, but not longer than two additional years, and the period for the completion of construction carried on in good faith and with reasonable diligence may be extended by the commission when not incompatible with the public interests. In case the licensee shall not commence actual construction of the project works, or of any specified part thereof within the time prescribed in the license, or as extended by the commission, then, after due notice given, the license shall, as to such project works or part thereof, be terminated upon written order of the commission.

"In case the construction of the project works, or of any specified part thereof, have been begun but not completed within the time prescribed in the license, or as extended by the commission, then the Attorney General, upon the request of the commission, shall institute proceedings in equity in the district court of the United States for the district in which any part of the project is situated for the revocation of said license, the sale of the works constructed, and such other equitable relief as the case may demand, as provided for in section 26 hereof."

Mr. MARTIN. The Secretary of War very correctly calls attention to those provisions. If we do not commence construction of that project within the time fixed, the Federal Water Power Commission has to write us a letter stating that the license is canceled, and it is canceled, and if we do not complete the construction in the time fixed, unless there is good cause shown, the Attorney General, upon the request of the power commissioner, may take the whole property away from us before we go on it.

I also call attention to other provisions of the Federal water-power law safeguarding the public interest.

1. Excess profits from the water power must be paid to the United States, whether they are profits of a public utility or a private user. (Reg. 18, sec. 10d.)

2. The franchise is limited to 50 years (sec. 6), conditioned upon acceptance of all the terms and conditions of the act.

(a) The right of the United States or any State or municipality is expressly reserved to take over by condemnation proceedings and maintain and operate the project at any time during the 50 years license period upon payment of just compensation to the licensee therefor. (Sec. 14.)

• (b) At the end of the period the right is reserved to the Government to take over the project upon payment of net investment by the licensee, but not to exceed its fair value. (Sec. 14.)

(c) At the end of 50 years, in event the Government does not exercise the right to take over the project, preference is given to applications by States or municipalities. (Sec. 7.)

(d) No preference right for renewal of the franchise or any proprietary claim for power is secured to the licensee. If a license is renewed, it must be under the then existing law and regulations. (Sec. 15.)

8. The licensee can not execute a transfer of any right secured under the license or of property under the license without the written approval of the power commission. All transfers or assignments, whether by judicial sale or foreclosure, must be subject to the conditions of the act. This is construed by the present power commission to extend to a lease of any property under license. (Sec. 8.)

4. The licensee is required at its own expense, under the supervision of the power commission at all times, to maintain the project adequate for purposes of navigation and efficient operation in the development and transmission of power, must make necessary renewals and replacements and maintain adequate depreciation reserves. (Sec. 10c.)

5. The licensee is required to provide free of cost, power for operation of all navigation facilities (sec. 11c), and authority is reserved in the Government at all times to prescribe regulations governing control of the pool level and other regulations in the interest of navigation, including maintenance of operation of necessary lights and signals. (Sec. 18.)

6. All power sold from the project by the company regarding the service rendered its customers and its rates and charges of payment therefor are at all times subject to regulation by duly constituted public authority. (Sec. 19.)

All power sold in public service entering into interstate commerce must be "reasonable, nondiscriminatory, and just to the customers, and all unreasonable discrimination and unjust rates or services are hereby prohibited and declared unlawful."

7. After 20 years of operation, amortization reserves are required out of surplus earned thereafter, if any, not in excess of a specific reasonable rate of return upon the actual, legitimate investment to be applied, in the discretion of the power commission, in reduction of the net investment of the licensee. (Sec. 9d.) This rate has been fixed by rules and regulations of the power commission.

8. The licensee is required to make equitable contribution for benefits accruing to it from headwater improvements either by storage reservoirs or otherwise, whether done by other licensees or by the Government. (Sec. 10f.)

9. "Combinations, agreements, arrangements, or understandings, expressed or implied, to limit the output of electrical energy, to restrain, direct or to fix, maintain or increase prices for electrical energy or service are prohibited." (Sec. 9h.)

10. The right is expressly reserved to the United States at any time, in the opinion of the President, to take over, when the safety of the United States demands, the project for manufacturing nitrates for "manufacturing nitrates, explosives, or munitions of war or for any other purpose involving the safety of the United States," but involving a liability only for just and fair compensation for use of the property taken, to be determined by the Power Commission upon a basis of a reasonable profit to the licensee in peace time, plus the cost of restoring the property to as good condition as when taken, less a reasonable value for improvements made by the United States that are serviceable and valuable to the licensee. (Sec. 16.)

One of the other pending offers requires the Government to protect the company from losses by such use and to return the property in as good condition as received, plus reasonable compensation for the use thereof.

11. The United States is vested with authority to revoke the "license or to remedy or correct by injunction, mandamus, or other process any act of commission or omission in violation of the act or lawful regulation issued thereunder."

MR. QUIN. I am assuming you are going to do all these things. As between the Government and the Alabama Power Co., the title to everything except the Wilson Dam is given when you complete the construction mentioned there, with the exception that the Alabama Power Co. is to furnish 100,000 secondary horsepower

to the Government for any purpose the Government may see fit to use it for. That is true, is it not?

Mr. MARTIN. Yes.

Mr. QUIN. As to the value of that to the Government no man could say, except problematically. Then, under your proposition, you skim off the cream and leave the Government the whey, do you not, in plain language?

Mr. MARTIN. No, sir; the Government gets a lot of cream, because it saves at least \$2,000,000 a year in the form of an outlay in interest which it would otherwise pay; it saves its annual losses by way of maintaining and upkeeping the dam and the gates. You have to remember those things in a hundred years would amount to a great deal of money. Then it has the two nitrate plants, also.

Mr. QUIN. And the Government would be at the expense of maintaining and keeping up the nitrate plant in stand-by condition. You do not pretend in your offer to have anything to do with that.

Mr. MARTIN. The Government is going to get this \$5,000,000, and 4 per cent interest on that is \$200,000 a year, and you will find that is practically a sufficient sum to maintain the nitrate plants forever.

Mr. QUIN. With that nitrate plant being shut off from the coal fields, 88 miles away, and with the steam plant, the reserve power which would be right there on the ground, that is given to you, do you not think it would be a rather ridiculous attitude for the Congress to practically abandon the real intent and purpose for which that plant was constructed by accepting the offer of the Alabama Power Co.? I am not talking from any other viewpoint but that one viewpoint. It has been stated what the purposes were, and you know them as well as the committee.

Mr. MARTIN. No; to the contrary, you would be realizing the purpose for which the development was undertaken; namely, to get waterpower for the operation of this plant. You have the two nitrate plants, and we propose to you to keep them. We say to you keep the nitrate plants and we will deliver to you, in lieu of the steam-plant equipment, power which will be sufficient, and which you may use in the manufacture of fertilizer, and that power you have in lieu of your steam plant equipment, and with that you may operate these nitrate plants.

Mr. QUIN. Yes; and they would be handicapped to the extent of knowing that they could not get any primary power and that they would be in the hands of the Alabama Power Co. for the procurement of the secondary horsepower, which you say is procurable about 82 per cent of the year.

Mr. MARTIN. Mr. Quin, no one is in the hands of a public utility. Its rates are regulated by a public service commission, and if no public service commission exists in a State, then they are regulated by the Federal Power Commission. We have no voice except to initiate rates. The public authorities themselves fix the rate. With this great steam plant, with these other hydro-electric plants in the immediate vicinity, and in many other portions of the State, you have a direct call on all the primary power that anyone would ever need at rates that are reasonable.

Mr. QUIN. Mr. Martin, according to the evidence produced here, the Alabama Power Co. has practically all of the available sites there, outside of this site and site No. 3.

Mr. MARTIN. I do not know that that is the evidence, but I am speaking of whatever power there may be developed. Whatever power is developed and transmitted to the user is transmitted at rates which by law must be fair and reasonable.

Mr. QUIN. That is true, but the evidence shows that your company has already, through lease or acquisition, gained control of practically all of the available water power in that State or territory.

Mr. MARTIN. Whatever developments we have made in this situation have reduced the cost of the power to the user from 3 cents, which prevails in your State, Mr. Quin, to about 8 mills in ours, and if you take the powers which exist in Alabama, Georgia, and Tennessee, producing as they do a billion and a half kilowatt hours a year, what would it cost if we had those rates prevailing in Mississippi? It would cost the consumer \$45,000,000 a year.

Mr. QUIN. But they have no water power there.

Mr. MARTIN. That is true, and at these same sites the public industries are going to pay approximately \$12,000,000 for that same power, a net saving to the public in those States over the rates which prevail in your own State of over \$30,000,000 a year. You have no water power. The effect of these water powers which have been developed is to reduce the rates to the public and to create for the public a great advantage which realizes itself in industrial development

and your State will realize it, and other States will realize it in proportion as the water-power industry is developed, and the lines are built to carry power into the different States.

Mr. QUIN. Do you believe any representative of the Government ought to recommend a monopoly of a great public utility like that; that is, a natural resource of that kind?

Mr. MARTIN. It is a resource that can be developed and can be transmitted to the public, and it can best be developed in great units and a great system combining the water powers in different water sheds can give the public advantages which come from low seasons in one place and flood seasons in another in such a way as you can not otherwise realize those great advantages for the public.

Take first your own Army engineers. The Engineer board, headed by Col. Keller, have transmitted a report to Congress, which I read to you, in which they have told you that the only way in which Muscle Shoals will ever realize its true economic value is by the connection of that water-power development with the development in other watersheds.

Mr. QUIN. But they do not recommend that one corporation should own them all?

Mr. MARTIN. No; one company can not own them all. That report recommended the interconnection of this system, this development, with the system of all the companies, if you please.

Mr. QUIN. There are several of them down there, and five of those concerns wrote a letter, dated June 24, 1921, to Gen. Beach, the Chief of Engineers.

Mr. MARTIN. Several of them did.

Mr. QUIN. They said this secondary horsepower would be of no practical value. Were they correct in that statement to the War Department?

Mr. MARTIN. I do not put it that way. I do not think they made just that statement, Mr. Quin.

Mr. QUIN. Here is their language.

Mr. MARTIN. Whatever statement they made.

Mr. QUIN. This is what they say: "The 10 months' secondary power which it is possible to produce at Muscle Shoals has little or no commercial value." What do you say about that?

Mr. MARTIN. Our views are expressed in our letter of May 6, 1921, in which we take the view that this development has a commercial value and had its true economic place in southern affairs, and if the Government desired to go ahead with that development in a way to make some of the power available to the public, we were prepared to go forward with it. We know that power has great value in connection with the systems of other companies in that part of the country.

Mr. QUIN. You take issue with those other water-power companies in that part of the country who wrote that letter I referred to?

Mr. MARTIN. We stand on the letter we wrote to the Chief of Engineers. We have stated the situation; we know that our letter is correct; we know there are great public advantages which will come from carrying out projects along the lines of that letter.

Mr. QUIN. You do not indorse that letter those other gentlemen wrote?

Mr. MARTIN. We stand on the letter we wrote, and as I explained to you, our letter expresses our views. If those gentlemen expressed those views, they do not know enough about the situation down there.

Mr. QUIN. All I know is that it was presented to the committee and appears on page 114 of the hearings.

Mr. MARTIN. If those views are in conflict with our views, we stand on our position, and we show our good faith by telling you that we are ready to procure the money to complete the development without any Government expense. That is the best guaranty that we can give you.

Mr. QUIN. Since you have mentioned that, Mr. Martin—it will naturally come up on the floor of the House—therefore I will ask you how the Alabama Power Co. will be able to do this? This is a pretty big undertaking, as proposed in your offer. How are we going to answer that question?

Mr. MARTIN. We realize that it is a big undertaking, Mr. Quin, but as a company that is established as a going company and is selling power to the public, having 60,000 consumers of their energy, direct and indirect, that has a fixed position in the money market, has a fixed position by which it can go out and sell its securities to most of the public. We have a power development

now, and we issued and sold approximately \$10,000,000 worth of securities in the year 1921. We first make a program which is sound—

Mr. QUIN (Interposing). What time of the year did you sell those?

Mr. MARTIN. During every month in the year we were selling them. We sold some in July, the principal part were sold in December and January.

Mr. QUIN. What amount did you say that was?

Mr. MARTIN. About \$10,000,000.

Mr. QUIN. Why is it that you did not make an offer about the time Mr. Ford did, when the War Department called for it?

Mr. MARTIN. You have expressed it somewhat in your reference to the fact that the sum of money involved is very large. When we come to realizing large sums of money, the principal months in which we have realized those large amounts from the sale of securities have been the months of December and January, and the money markets did not permit of our going out and saying we could raise this sum of money in the early part of the year. But the financial conditions in this country have been improved now, and long-term securities may be marketed now to a greater extent on a better basis than they could 30 days ago, or even 60 days ago.

Mr. QUIN. Would your company depend for the carrying out of its contract upon the sale of its securities, or has it already a guaranty that the money will be advanced through other enterprises or holding companies?

Mr. MARTIN. No other enterprises are connected with us. There is no utility connected with our undertaking; there is no other enterprise, no other industrial enterprise, connected with our proposition. We have gone into it very fully with our associates in the banking business, who are ready to assist us in finding funds for developments, and we are satisfied that this project can be set up in a sound business way and that we can sell our securities on the face of it.

Mr. QUIN. Your proposition would, of course, leave the Government helpless as to navigation, except for the canal that is there.

Mr. MARTIN. I think that I am right in saying that the canal leads from the upper river into this pool; does it not, Judge Almon?

Mr. ALMON. The canal that was put in there has been there for many years.

Mr. QUIN. The only way to have the navigation contemplated would be to build the Dam No. 3 and the other smaller dams above that you mentioned this morning?

Mr. MARTIN. Yes; and Dam No. 1. That is downstream from Dam No. 2.

Mr. QUIN. This river at the point of Muscle Shoals flows in an easterly and westerly direction, does it not?

Mr. MARTIN. Approximately.

Mr. QUIN. About how far from there is it that it turns back toward the Ohio River?

Mr. MARTIN. Thirty or forty miles; it goes in a northwesterly direction.

The CHAIRMAN. The hour of half past 12 has arrived, when we usually take a recess, and if you will come back at 2 o'clock, Mr. Martin, we will appreciate it. You have been very patient and very kind.

Mr. MARTIN. I think the committee has been very patient with me, Mr. Chairman.

(Thereupon a recess was taken until 2 o'clock p. m.)

AFTER RECESS.

The committee met, pursuant to recess, at 2 o'clock p. m.

ADDITIONAL STATEMENT OF MR. THOMAS W. MARTIN, PRESIDENT ALABAMA POWER CO.—Resumed.

The CHAIRMAN. Mr. Martin, Mr. Quin would like to ask you a few more questions.

Mr. QUIN. Mr. Martin, you stated that for the purpose of carrying out your proposition to the Government you would raise the money through floating your securities, bonds, or whatever method would be adopted by your company.

Mr. MARTIN. Yes.

Mr. QUIN. What do you figure the brokerage fees, added to the interest, would make the interest cost you?

Mr. MARTIN. We have not those figures anyway definitely, Mr. Quin. You understand that all those things depend upon the prevailing market conditions, and the conditions that prevailed a year or so ago are not the conditions that prevail now, and the conditions that prevail now may not be the conditions that will prevail six months from now.

Mr. QUIN. What did you have to pay for money in January of this year?

Mr. MARTIN. The securities were retailed to the public at a little over 6 per cent. We do not know what the conditions will be six months from now. We hope they will be better, but our plan, of course, is the same as that of all other public service companies, to go into the market and obtain money on the most favorable terms and the best terms that prevail at the time, and I believe that our company is in position to obtain funds on just as favorable a basis as any public utility in the country.

Mr. QUIN. Mr. Martin, the big packing plants paid 8 per cent, their statement shows.

Mr. MARTIN. Oh, undoubtedly there have been securities sold on an 8 per cent basis within the past 12 months, and even on higher rates, Mr. Quin, within two years, when very extravagant rates of interest were paid, but you will appreciate that long-term, good investments in securities of this kind appeal to the public. For instance, take the past year. In the past 12 months there were securities of light and power companies sold amounting to \$472,500,000, of which \$145,498,000 were issued and sold by hydroelectric companies, most of them within the past 60 or 90 days, and there is an established, good going market for high-grade securities based on hydroelectric properties; and furthermore, Mr. Quin, when you consider the demands that are going to arise from year to year, the natural and normal demands of the lighting and power industry of this country will require approximately \$733,000,000 a year for a number of years to meet the public demand. A great deal of that will be devoted directly to the manufacture and distribution of hydroelectric energy. Part of it will be for other services relating to lighting and power. When you go into the question of financing public utilities of this class, you must remember that the Government's program of financing some part of the public utility situation in the South involves not alone that, but if the Government undertakes the financing of hydroelectric properties at all you are going to run into the policy of financing them generally, involving volumes of money here that we can not foresee by any sort of a guess, this great industry requiring, as it does, over \$700,000,000 a year to meet public demands, and where will you come out if you do not meet those demands?

Mr. QUIN. You stated that you expected to develop through the completion of the Wilson Dam, with the aid of the steam plant, 240,000 horsepower; is that correct?

Mr. MARTIN. No; not through the use of the steam plant. Our suggestion, Mr. Quin, is simply that as this construction and development goes forward we would install 240,000 horsepower by the time the dam is completed and the power house ready for initial service.

Mr. QUIN. You mean that would all be water power?

Mr. MARTIN. Yes, sir; 240,000 horsepower would be the installation.

Mr. QUIN. There would be 240,000 horsepower installed, of which 100,000 horsepower would be primary power?

Mr. MARTIN. Yes, sir; and as the business grew in that territory, then the licensee or company would install further equipment until the complete installation in this power house is made; that is, assuming 600,000 horsepower as the complete installation, a company situated as ours, for instance, would install further units from year to year. We have a plant on the Coosa River, lock 12, where we have six units totaling 110,000 horsepower. We first installed three, and within another year or two we installed another, and then another, and then finally we reached the sixth unit, the sixth unit being installed about six years after the first three were installed, and that is the way this industry grows, and that is the way the installation is made to meet the demands as they arise.

Mr. QUIN. The question of the rate of interest and all overhead charges and costs would be bound to be taken into consideration by the public-utilities commission in the matter of rates, would they not?

Mr. MARTIN. Oh, yes; the question of rates, the question of service, and the question of securities issues are all under the control of the public-service commissions in the South. In our own State all those questions are under the control of the commission.

Mr. QUIN. If you have to pay a high interest rate, that comes out of the customers under the rate allowed by the public-utility commission?

Mr. MARTIN. Of course, the company is entitled to a fair return.

Mr. QUIN. And that is what the utility commission bases the rate on?

Mr. MARTIN. It bases the rates not necessarily on the cost of money, but they are based on the variety of elements that enter into that.

Mr. QUIN. And that is one of the elements, because a man is bound to be allowed a profit or he can not run.

Mr. MARTIN. Of course; and you must bear in mind that nowadays the very purpose of the public authorities in controlling security issues is to prevent an abnormal charge being made on the public through rates, and that is the situation now.

Mr. QUIN. You stated and showed by your map the territory that could be served by power there. That is also the main territory that uses commercial fertilizer, is it not, all those States around there—Alabama, Georgia, Mississippi, Arkansas, and the Carolinas?

Mr. MARTIN. Yes; that territory, of course, uses a great deal of commercial fertilizer.

Mr. QUIN. Then that place is located practically in the center of the real fertilizer community, is it not?

Mr. MARTIN. It is well located for that purpose.

Mr. QUIN. Do you not think that for the whole good, the question of cheap fertilizer being given to those communities amounts to a good deal more than the power consumed?

Mr. MARTIN. In the first place, Mr. Quin, we do not interfere with that question. According to the statements which have been made to this committee by Mr. Worthington and by others, 100,000 horsepower should be used in the cyanamid process in manufacturing nitrates at plant No. 2. We propose that the Government shall have that free. Now, when you get into the question of fertilizer, as to the advantage which comes from one or the other, we say that we are giving the Government a definite volume of power for that purpose. Now, when it comes to the balance of the power, whether it is used in industries locally, and a lot of it will be, or elsewhere, it is distributed by a concern engaged in public service. Your own State needs power, and needs it very much. You need only look at the industrial development in those States of the South which have great systems such as this and those which have not to see the relative advantages.

Mr. QUIN. We think we need fertilizer much more than we need that power.

Mr. MARTIN. Well, undoubtedly you do, and you should get them both.

Mr. FISHER. How many directors are there in the Alabama Power Co.?

Mr. MARTIN. There are 12 as I recall, Mr. Fisher.

Mr. FISHER. Could you give the ones who are American citizens and the ones who are aliens?

Mr. MARTIN. They are all American citizens but two. In Alabama there reside the following—shall I give the names?

Mr. FISHER. If you will, if you remember them.

Mr. MARTIN. I will try to remember them. These live in Alabama: Mr. Mitchell, Mr. Weatherley, Mr. Hobbie, Mr. Moody, Mr. Hassinger, Mr. Walmsley, Mr. Hood, and myself. These live in different parts of the North: Another Mr. Mitchell, Mr. Dahl, Mr. Swan, who is not related to the Mr. Swann who has testified here, and Mr. Grosbeck; and outside of this country, living in Montreal, Canada, there are Mr. McFarland and Mr. Henderson.

Mr. FISHER. Can you give us the percentage of the stock in the Alabama Power Co. that is held in this country by American citizens?

Mr. MARTIN. The stock of the power company and the stock of the holding company is held in this country something in excess of 40 per cent, consisting of the Alabama Power Co.'s preferred, and, of course, that votes along with the common, and the common stock of the holding company, which is largely held in this country, as I stated, those holdings amount to something in excess of 40 per cent, and the largest single holdings of the stock of the holding company are in this country, and the largest single holdings is by citizens of Alabama.

Mr. FISHER. Are you stating that from a careful examination of the stock books of the Alabama Power Co.?

Mr. MARTIN. Yes. I have not seen the stock books for some time. Mr. Fisher but I keep up with it, naturally, from contact with the secretary of the company.

Mr. FISHER. As I understand the history of the contract with the United States Government, you formed a tentative agreement a year before the final contract was signed; is that correct?

Mr. MARTIN. Yes. May I go back to your former question just a moment?

Mr. FISHER. Yes.

Mr. MARTIN. As I stated to Mr. Quin, taking our securities, both bonds and stocks, about 65 per cent of all our securities are held in America, and all the securities of our company which carry any interest charge at all or any dividend charge, practically all of them, are held in this country. We have never paid any dividend on the common stock, and all of our dividends and earnings have practically gone to American citizens. I am very sorry to say that because people abroad who invested in our securities have been disappointed, and disappointed because of the reorganization which had to take place in our company in 1914, due to the changing conditions brought about by the late war.

Mr. FISHER. As you understand, this nitrates proposition is one of national defense, and you can understand why this matter is of interest to Congress and to the country.

Mr. MARTIN. Yes.

Mr. FISHER. Now, referring again to the date of the tentative contract which you had with the Government and the final contract, what transpired through all that period of time to delay a contract on so large a job? You were spending millions of dollars for the Government each month, were you not?

Mr. MARTIN. No; not each month.

Mr. FISHER. Within a few months' time.

Mr. MARTIN. These expenditures, of course, ran over a period of 12 to 15 months. We did not spend the money. The Government had a disbursing officer there. It was spent directly. As you probably know, all the purchases were made for the account of the Government, on its approval, and the moneys were paid direct by the disbursing officer from funds which he had to his credit arranged in some way through the Treasury Department of the United States. We did not control any of the funds.

Mr. FISHER. Who were the officers in the Ordnance Department that you negotiated with in this contract?

Mr. MARTIN. I believe I stated to you that at different times we had negotiations with Col. Joyes, Col. Beames, and there was a Col. White, who had something to do with our contract, and Maj. Coombs. At one time, in its inception, the question was before the War Industries Board, Power Section, and Gen. Keller had a great deal to do with the whole subject of the location of power facilities; Gen. Charles Keller, of the United States Army. Then there was Capt. Raymond Hull Noble, who was the counsel for the Government in the beginning of the negotiations, and who died in the summer of 1918; and there was Lieut. Col. William Williams; and at another time Maj. Burns had some part in it; and Capt. Gaillard was another officer; and Maj. Runcie was another officer of the Government; and Maj. Gen. Williams, who is the Chief of Ordnance.

Mr. FISHER. Which one of those officers is the officer who had the final say as to the approval of the items of the contract?

Mr. MARTIN. Well, I am not able to say. In its beginning Col. Joyes initiated the program. It was approved, however, by the power section of the War Industries Board, and in carrying out the contract at some points the negotiations were taken up and concluded by Col. William Williams. Now, just who had the authority I can not say. I can only say who I discussed it with.

Mr. FISHER. Were you in Washington the day the fake armistice notice came out?

Mr. MARTIN. No, sir.

Mr. FISHER. Was the contract signed in Washington?

Mr. MARTIN. No, sir; it was signed in New York. I was present when the contract was signed.

Mr. FISHER. Was there anything about the fake news story that produced the signing of the contract?

Mr. MARTIN. No.

Mr. FISHER. Did that have anything to do with it?

Mr. MARTIN. Not a thing.

Mr. FISHER. You had expended millions of dollars for the Government over the period of a year with no contract, and news of the armistice came or of the end of the war, and the contract was signed. That was just a coincidence. Is that your interpretation of it?

Mr. MARTIN. Col. Williams asked us to meet in New York for the signing of the contract, and we met there in pursuance of his request.

Mr. FISHER. It was always understood, was it not, that this was a war contract?

Mr. MARTIN. Yes, sir.

Mr. FISHER. Would you kindly tell the committee just when you stopped work on this contract?

Mr. MARTIN. We did some work at our own expense some time in the spring of 1919. We stopped work in the spring of 1919. The Government's expenditures stopped very soon after the contract was made and we took it up and completed the work.

Mr. FISHER. Did the Government ever get any power from the extension to your plant that was erected?

Mr. MARTIN. No; it was this way, Mr. Fisher: The Government had the right to take power from this extension, or, rather, from our company, say, 80,000 kilowatts. The Government also had the right to suspend the taking of energy under the terms of the contract. If the Government took power under that contract, it meant a very large volume, and, of course, a very large use for power, with a minimum monthly charge of \$30,000, because we had to provide a staff and coal and men to furnish that power. Now, there never was a minimum charge of \$30,000 a month paid, because when the armistice came the use of power in large volume was unnecessary. So Col. Joyes or Maj. Burns, I have forgotten who it was now, gave us an order suspending the right to take energy under the contract and electing to take energy from our system as any user of power would. So our company supplied power to the Government, not under the contract but at rates prevailing for such service fixed by the public service commission of Alabama, and from that time on we have supplied the Government with power for the needs at Muscle Shoals, for construction needs around the Wilson Dam, for lighting and policing, and such operating as took place at the nitrate plant. Of course, before the Warrior extension was completed and during the period of the war, we supplied the Government with power in varying amounts from 10,000 kilowatts to 30,000 kilowatts for its uses, and that was from our system before the extension was completed.

Mr. FISHER. Was any work done down at Gorgas under this contract other than the completing of the extension of the powerhouse? Was there not some work done on a railroad after the armistice?

Mr. MARTIN. Part of that was done before and most of it afterwards. Our company expended in completing the railroad \$105,000 and the Government expended \$30,000. All the money we spent was entirely after the armistice.

Mr. FISHER. The war was over, and when did you begin to take steps to bring about an adjustment of your differences which the Government and a settlement? You had this enormous extension to your plant which was the property of the Government; when did you begin to take steps to bring about a settlement with the Government, or did you take any steps?

Mr. MARTIN. You mean—

Mr. FISHER (interposing). Under the contract, did you take any steps at some time after the armistice, or how soon after the armistice did you take steps to bring about a settlement?

Mr. MARTIN. The whole matter was adjusted within 90 days after the armistice, we taking over the completion of various work at our expense, and the Government's advances stopped.

Mr. FISHER. Has anything been done in the last year by the Government or by you toward bringing about a settlement?

Mr. MARTIN. You mean taking over the property?

Mr. FISHER. Yes.

Mr. MARTIN. We discussed the question several times, and we were preparing to start this arbitration last summer, and the Ford proposal came in, involving this property, and the Ordnance Department were unwilling to go any further until the Secretary of War disposed of that. We were in active negotiation looking to the arbitration and settlement of the whole matter last summer and last fall.

Mr. FISHER. Until the Ford offer was made last summer you took no further interest in Muscle Shoals, did you? You had no interest in the development of Muscle Shoals?

Mr. MARTIN. Yes; of course; our letter of May showed our interest.

Mr. FISHER. But not in the near future?

Mr. MARTIN. Yes; in the immediate future, because we had to have power to meet the public demands.

Mr. FISHER. Would you have made an offer for the Muscle Shoals project if Ford had not included in his offer the Gorgas power plant and the transmission line?

Mr. MARTIN. We have always felt, Mr. Fisher, that this Muscle Shoals development should be made in such a way as to interconnect with power systems of the southeast, and our letter of May showed exactly how we felt about it, and we stand on the terms of that letter.

Mr. FISHER. Who was the lawyer for the Alabama Power Co. in all the negotiations leading up to the signing of the contract? Did you represent them as their general counsel at that time?

Mr. MARTIN. I was general counsel, and the only other lawyer we had was Mr. Weathers, the gentleman right here [indicating].

Mr. WRIGHT. Mr. Martin, I understood you a day or two ago, in response to a question from Mr. Miller, to state that this 100,000 secondary horsepower mentioned in section 2 of your offer would be available to the Government or the Government's assignee for the purpose of the production of fertilizers at Muscle Shoals or munitions of war, and for making experiments in the production of fertilizer or for any other purposes for which the Government might want to use this power. Did I understand you correctly?

Mr. MARTIN. If I understand your question; yes. We proposed to furnish the 100,000 horsepower, as required, for the production of fertilizer and munitions of war and for research work.

Mr. WRIGHT. But if I understood your response to Mr. Miller, if the Government did not see fit to use it for that purpose, it would be available to the Government for any other use it might want to put it to?

Mr. MARTIN. Substantially so. I assume the Government, if it did not want to use it for these purposes, would want to sell it. I do not suppose the Government would want to engage in public service. That is the only thing I have in mind.

Mr. WRIGHT. Have you your offer before you?

Mr. MARTIN. Yes, sir.

Mr. WRIGHT. I call your attention to section 2. Let us read that carefully:

"To furnish free to the Government, or anyone it may designate, from the hydropower plant 100,000 horsepower, as required, for the production of fertilizers and munitions of war and for research in connection therewith; and if, due to changes in the art, this use of such 100,000 horsepower is discontinued by the Government, the Alabama Power Co. to purchase and pay for same in accordance with a schedule to be set forth in the license, this power to be the second 100,000 horsepower at any time available from the normal flow of the river."

Of course, Mr. Martin, it is very proper we should understand what a proper construction of that section is, as it may be practically applied. That is a very clear statement, as I read it, and there is no ambiguity.

Mr. MARTIN. No, sir; there was none intended.

Mr. WRIGHT. And can that section mean anything except that this 100,000 secondary horsepower shall be available to the Government or to anyone it may designate for the sole purpose of the production of fertilizers or munitions of war and for making experiments or for research work in connection therewith, or if due to any changes in the art, the Government or its assignees do not so use that 100,000 secondary horsepower, can any other use be made of it than to sell it to you under the terms of that section?

Mr. MARTIN. What other use could there be, Mr. Wright?

Mr. WRIGHT. I am just asking you the question. I understood you to say the other day that the Government could use it for any purpose.

Mr. MARTIN. If you want to modify it and make it available—

Mr. WRIGHT. No; does not the section itself modify it? Does it not limit it by the very language of the section to its use for the production of munitions of war and fertilizers in the operation of these plants?

Mr. MARTIN. We did not have in mind any limitation, and if you want to expand the scope of those words, that is all right.

Mr. WRIGHT. I am not trying to expand its meaning. I am trying to suggest what it means as it is written here.

Mr. MARTIN. We were all dealing with a question of fertilizers and munitions of war.

Mr. WRIGHT. I understand that; but I think it is material, Mr. Martin, in the light of what has developed here, that we should understand that; that is all.

Mr. MARTIN. Any expansion in meaning you want is entirely satisfactory to us. All of this proposal doubtless will be the basis of some contract or license.

Mr. WRIGHT. You agree with me, then, that under the terms of this section that would be the proper construction?

Mr. MARTIN. Yes.

Mr. WRIGHT. So that it would not be available to the Government to light the camp at Anniston or Camp Benn ng?

Mr. MARTIN. I think it would, as drawn.

Mr. WRIGHT. You think so?

Mr. MARTIN. Yes. I did not have in mind that precise use, but I do not think it would be a very extreme construction, and certainly, so far as we are concerned, if you want to modify it in any way, it is entirely satisfactory to us.

Mr. WRIGHT. I notice you wind that section up with this language:

"This power to be the second 100,000 horsepower at any time available from the normal flow of the river."

Is there any particular significance about the words "from the normal flow of the river"? Does that mean that the Government gets the very first 100,000 secondary horsepower at this plant?

Mr. MARTIN. That is what we intended to express, Mr. Wright.

Mr. WRIGHT. You have said that that 100,000 second horsepower would be available for 82 per cent of the period, and that is based on the average taken for the past 30 years.

Mr. MARTIN. Yes; those records, Mr. Wright, you know, have been very carefully kept.

Mr. WRIGHT. Of course, you have to have some basis for that, and you have carefully compiled this from the records for the past 30 years.

Mr. MARTIN. And the United States Geological Survey has had its gauge readers on this river for 30 or 40 years, and on the Chattahoochee River and the Alabama and the Coosa, and the records of those rivers are in splendid condition, and we have compiled our figures from those records.

Mr. WRIGHT. I understand that, and I do not challenge the statement at all, and I assume you are correct in saying that the average for the past 30 years would be 82 per cent.

Mr. MARTIN. Yes, sir.

Mr. WRIGHT. That is the best information available.

Mr. MARTIN. Based on daily stream flow on records taken for 30 years.

Mr. WRIGHT. There is no difference between us about that, but what I do want to ask you about is whether you have any records or statistics to show in this period of 30 years what the least production would have been.

Mr. MARTIN. Yes, sir; those records all show that.

Mr. WRIGHT. What is that? What is the least it would have produced in any one year, or the year when the flow was lowest?

Mr. MARTIN. You mean the 100,000 secondary horsepower?

Mr. WRIGHT. Yes, sir. So that you may understand me fully, as I understand, the average during the 30 years would have been about 10 months in the year?

Mr. MARTIN. Yes; something like that.

Mr. WRIGHT. Now, I want to know the year, if there was a year, during the 30 years when it was less than 10 months a year, and how much less.

Mr. MARTIN. If you will look at this map and follow me here, I can show you that.

Mr. WRIGHT. But I want to get the figures in the record. That is a beautiful map, but I doubt if they can get that in the record.

Mr. MARTIN. No; they probably can not. There are 6 years out of the 20 here when none of this power would be available for certain months of the year.

Mr. WRIGHT. What proportion of the year is that? That is what I want to get at.

Mr. MARTIN. For instance, in 1899 the river flow was such that there were two months.

Mr. WRIGHT. Two months when it was available?

Mr. MARTIN. When it was not available. In 1903, there were two months; in 1904, there were two months; and in 1913, there were three months. Nineteen hundred and thirteen is the longest continued interruption in the history of the river.

Mr. WRIGHT. So that during that year this power would have been available for nine months?

Mr. MARTIN. Yes. During 1914, one month, and if you will notice in some of these years the power is available for every month in the year. You can see how this chart will give you a better idea of the real value of this power and its availability—

Mr. WRIGHT. I will be very glad to examine the map, but I want to get these figures in the record. What three months do the records show that that power was not available?

Mr. MARTIN. In 1899 the months of October and November; September and October of 1903; October and November of 1904; and September, October, and November of 1913; and November of 1914. It is all in the same period of the year.

Mr. WRIGHT. Now, Mr. Martin, when you spoke about the average being 82 per cent, or, in round numbers, 10 months in the year, that does not necessarily mean that you would get that power for 10 consecutive months in the year, but it would vary, perhaps, each month, would it not? You would get a certain quantity one month, say, July, and probably a larger quantity in August or a less quantity in August, and it would not be uniform because then it would be primary.

Mr. MARTIN. For certain months of the year it would be uniform, of course. You can look at this map and see how it runs.

Mr. WRIGHT. In other words, to get that clear, if a plant was in operation that required a steady current of power 12 months in the year or say 10 months in the year, it would not get an equal amount of this secondary power each month.

Mr. MARTIN. What you would do would be just as one of the witnesses explained here; you would plan those operations of your plant which required the full 100,000 horsepower for those months in the year when you would get this power. The records of that district are such that that power will be available, according to any human calculation, for certain months in the year or certain parts of the year. Then the plant would be adjusted to manufacture to its highest capacity during those months, reducing it to meet the stream flow conditions at other months. That is exactly what has been explained so fully by Mr. Bower in his former testimony.

Mr. WRIGHT. I just wanted to explain that some one who operated that plant utilizing secondary horsepower could not figure they would run 10 months in the year with that horsepower because it would not mean that they would get an equal quantity of it during each of the 10 months.

Mr. MARTIN. They would not get an equal quantity of it during each of the 10 months, but you could adjust your operations to meet what, according to the history of the river, would be the result there.

Mr. WRIGHT. But if you wanted to run uniformly, of course you could not do that, because it would depend on the flow of the river as to how much you got each month.

Mr. MARTIN. Of course, during the fertilizer season, when the demand is the greatest, this record shows you that the power is available and always has been available.

Mr. WRIGHT. Now, Mr. Martin, I note from your offer that in case the Government should not make use of this 100,000 secondary horsepower it will sell it to your company at rates to be fixed in the license which may be granted you by the Water Power Commission, and that is a matter about which the commission would have some discretion, is it not?

Mr. MARTIN. Oh, yes.

Mr. WRIGHT. That power is vested in the commission and Congress would have nothing to do with that.

Mr. MARTIN. That depends on your legislation, of course.

Mr. WRIGHT. I mean as it stands now.

Mr. MARTIN. Having authority to deal with that question, I presume they would deal with it.

Mr. WRIGHT. But the matter of the price of that power would be a matter of negotiation between your company and the Federal Water Power Commission.

Mr. MARTIN. Yes, sir.

Mr. WRIGHT. There is also some discretion vested in the commission as to the time you shall commence the work—not to exceed two years, I believe it is.

Mr. MARTIN. Yes.

Mr. WRIGHT. And the commission might have the power to extend the time for an additional two years.

Mr. MARTIN. I will have to look at the law to get those exact terms.

Mr. WRIGHT. I think that is correct.

Mr. MARTIN. We must begin the construction within the time fixed in the license, not more than two years from the date herein, and if the commission wants to fix it in 30 days, we will begin with 30 days after the license is issued. That is a matter entirely in the hands of the commission. There is no difficulty in fixing that, and that matter and the period for completing the construction are matters entirely in the hands of the commission.

Mr. WRIGHT. Of course, under your offer the work might be delayed for four years if the commission granted you two years to begin work and then granted you an extension of two years more, which they would have authority to do under this Federal water power act.

Mr. MARTIN. Acting in the utmost good faith, as we are, Mr. Wright, there is no reason why there should be any such period of time.

Mr. WRIGHT. I am not inquiring about that. I am saying that that could happen.

Mr. MARTIN. That is possible to happen, but unless there is a catastrophe or a world emergency of some kind, there is no reason to suspect any such condition as that arising. If we had the license to-day, we could begin next week, so far as that goes.

Mr. WRIGHT. Mr. Martin, Mr. Hill, I believe, asked you about the current necessary for these Government posts at Anniston and Benning and several other points. As a matter of fact, there is very little current required, comparatively speaking, for those activities of the Government, is there not?

Mr. MARTIN. Now, I could not answer, Mr. Wright. I am not personally familiar with just what the requirements are.

Mr. WRIGHT. It is principally lighting, is it not?

Mr. MARTIN. Lighting and pumping and small motors of various kinds. There is a variety of uses always at those places.

Mr. WRIGHT. But, comparatively speaking, there would be a very limited quantity required.

Mr. MARTIN. Of course, it depends on the activities there and the number of men. There is an aviation camp at Montgomery, where there are machine shops that employ a number of men who are engaged in repair work, and I suppose that single shop will use as much power as a large camp where men are employed. Those things depend on the uses and the number of people.

Mr. WRIGHT. Mr. Martin, you were asked about the power in and around Camp Benning, near Columbus.

Mr. MARTIN. Yes.

Mr. WRIGHT. That is right on the Chattahoochee River.

Mr. MARTIN. Yes, sir; that is in your district, I believe.

Mr. WRIGHT. That is quite a river, is it not, Mr. Martin?

Mr. MARTIN. Yes; although I do not know very much about it.

Mr. WRIGHT. So far as power is concerned.

Mr. MARTIN. Yes.

Mr. WRIGHT. And the community there at Columbus speak of themselves as a place with the push and the power, do they not?

Mr. MARTIN. I think they do.

Mr. WRIGHT. And they have power there, have they not?

Mr. MARTIN. They have power developments there.

Mr. WRIGHT. Do you know how many dams there are near Columbus?

Mr. MARTIN. I do not know. I think there are two or three.

Mr. WRIGHT. Three, are there not?

Mr. MARTIN. Yes.

Mr. WRIGHT. Right near Columbus?

Mr. MARTIN. We have been for years trying to work out a plan of connecting our lines from Opelika to Columbus and from La Fayette to West Point with a view to supplementing our own situation down there and supplementing the Columbus power supply.

Mr. WRIGHT. Now, Mr. Martin, there is another power about 18 miles north of Columbus known as Goat Rock Dam, is there not?

Mr. MARTIN. Yes.

Mr. WRIGHT. That is owned by the Columbus Power Co.?

Mr. MARTIN. Yes; although I have never been there.

Mr. WRIGHT. That is quite an extensive plant, is it not?

Mr. MARTIN. Yes; I think so.

Mr. WRIGHT. They run to Columbus and north of Columbus?

Mr. MARTIN. Yes; they have a large plant of 50,000 or 60,000 horsepower.

Mr. WRIGHT. And then at Newnan, Ga., the Columbus Power Co. and the Georgia Railway & Electric Power Co. each connect, do they not?

Mr. MARTIN. Yes, sir; their lines connect there.

Mr. WRIGHT. Now, as a water-power man—I am speaking of you as a water-power man—the Columbus Power Co. does not really need the current of the Georgia Railway & Power Co., and the Georgia Railway & Power Co. does not really need the current of the Columbus Power Co. except in cases of breakdown or something like that. Is not that the reason they connect up?

Mr. MARTIN. Yes, Mr. Wright; but you will remember that those two rivers, the Chattahoochee and the Tugaloo are in different watersheds, and that very fact—

Mr. WRIGHT (Interposing). I just wanted to know about those two companies.

Mr. MARTIN (continuing). And there is quite a fluctuation in the river flow of the Chattahoochee watershed and the Tugaloo watershed, and in the nature of things you are going to have water in one watershed when there is not water in the other, and the fact of being connected as they are makes it possible for them to use the water of the Chattahoochee to greater public advantage than if they did not have this connection. Inevitably that is the result. We find it so with our connection on the Coosa. We have a power on the Coosa, and so have the Georgia Railway & Power Co. on the Tugaloo. We carried their entire system for several weeks in the month of January. We had rainfall and they had none.

Mr. WRIGHT. I can see, Mr. Martin, why it would be very desirable to link these various systems together. I can understand that.

Mr. MARTIN. Yes.

Mr. WRIGHT. But the point I want to get back to is that they do not need any additional power in and around Columbus, Ga., now, do they?

Mr. MARTIN. I think if you will ask those gentlemen down there they will tell you they do.

Mr. WRIGHT. You think they do?

Mr. MARTIN. And if we could give them 20,000 horsepower, I think you would find they would be glad to take it.

Mr. WRIGHT. Do you get any power from them?

Mr. MARTIN. Not a bit; no.

Mr. WRIGHT. You do not get any from the Georgia Railway and Power Co.?

Mr. MARTIN. No.

Mr. WRIGHT. That is a wonderful, big system, is it not?

Mr. MARTIN. Yes, sir; and we carried all the load of that system with our big Warrior plant and our surplus that we had in our own system for nearly 60 days because they did not have the waterflow, and they did not have a reserve steam plant.

Mr. WRIGHT. Are you acquainted with numerous sites along the Chattahoochee River which could now be developed?

Mr. MARTIN. No; I am not.

Mr. WRIGHT. You are not familiar with the one at Franklin, Ga.?

Mr. MARTIN. I do not believe I am.

Mr. WRIGHT. That would produce 100,000 horsepower, would it not?

Mr. MARTIN. I really am not familiar with that, Mr. Wright.

Mr. WRIGHT. Does your company use the steam plant at nitrate plant No. 2.

Mr. MARTIN. Yes; we have leased it.

Mr. WRIGHT. I know you have it leased, but do you actually use any power from that plant?

Mr. MARTIN. We are not using it at the present time, but we have a force of men there, and it is in a condition to operate on very short notice.

Mr. WRIGHT. I think you leased that plant last November?

Mr. MARTIN. Yes, sir.

Mr. WRIGHT. But you have not used it up until now?

Mr. MARTIN. No; we took it over and it took us about 90 days to get the plant in readiness to operate. It was very carefully put away and we very carefully had to set the plant in motion again. It is now ready to operate and

undoubtedly will operate during the year to the capacity of the line from Warrior to this plant, which is 30,000 kilowatts.

Mr. STOLL. Mr. Martin, a good deal has been said about load factor, and I will have to confess my ignorance. What do you mean by load factor?

Mr. MARTIN. That is a term expressing use of power. It is the ratio of average use to the maximum use. For instance, there are 8,760 hours in a year; the volume of power used during those hours is integrated and divided by 8,760; this gives the average use. This average use is some percentage of the maximum use. This percentage is called load factor.

Mr. STOLL. The amount of current consumed, you mean?

Mr. MARTIN. It is the amount consumed.

Mr. STOLL. You and Mr. Fields had quite a discussion about the load factor and I was not able to follow that.

Mr. MARTIN. Will you allow me to ask Mr. Thurlow to express it as an engineer in terms that you can get in the record?

Mr. STOLL. I wish you would.

Mr. THURLOW. It is the ratio of the average consumption to the peak demand; that is, the ratio of the average horsepower demand to the maximum instantaneous horsepower demand during any given period.

Mr. STOLL. When did your directors meet to make this offer?

Mr. MARTIN. February 15.

The CHAIRMAN. What year?

Mr. MARTIN. 1922.

The CHAIRMAN. About two or three weeks ago?

Mr. MARTIN. Yes.

Mr. STOLL. The minutes of your concern show the fact that you met and authorized this offer?

Mr. MARTIN. Yes, sir.

Mr. STOLL. Your offer, as I understand it, is that if the Government will give you Dam No. 2 as it stands you will complete it?

Mr. MARTIN. Yes.

Mr. STOLL. And that you will give them, we might term it, as a rental for it 100,000 secondary horsepower. What is that 100,000 secondary horsepower worth a year in dollars?

Mr. MARTIN. All I can do is just to express what I did this morning, Mr. Stoll. We had quite a discussion of that. Mr. Fields and I discussed that very fully this morning.

Mr. STOLL. I know you did, but I never did catch it. You had too much "factor" in it for me.

Mr. MARTIN. A year ago there were figures which were used in the hearings then of \$7.50 per horsepower per year.

Mr. STOLL. Let me ask you this question: Can you express in dollars what that would be worth?

Mr. MARTIN. Per horsepower per year there were two figures used this morning, \$7.53 and \$7.80. Mr. Fields suggested \$7.80 and a year ago the figure was used in the hearings of \$7.53 per horsepower per year.

Mr. STOLL. Then it would be between \$7 and \$8 a year?

Mr. MARTIN. We will say that between \$7 and \$8 is a fair value for it used in this fertilizer industry, which, of course, would be from \$700,000 to \$800,000.

Mr. STOLL. Now, you offer to buy certain property. That is property you now claim to have a contract for the purchase of, I believe?

Mr. MARTIN. Part of it.

Mr. STOLL. Not all of it?

Mr. MARTIN. Part of the property covered by that contract, of course, is included.

Mr. STOLL. Do you not include it all?

Mr. MARTIN. All the property on which we have a contract.

Mr. STOLL. You offer to buy that?

Mr. MARTIN. We offer to buy that; yes.

Mr. STOLL. For \$5,000,000?

Mr. MARTIN. Plus the other property mentioned in this offer.

Mr. STOLL. What other property?

Mr. MARTIN. The other steam plant.

Mr. STOLL. The one at nitrate plant No. 1?

Mr. MARTIN. The one at nitrate plant No. 2, at Sheffield.

Mr. STOLL. You want to buy that, too, outright?

Mr. MARTIN. Yes.

Mr. STOLL. Is that \$5,000,000 less the value of the steam plant, what you term the fair value in your contract?

Mr. MARTIN. Mr. Stoll, that \$5,000,000 plus the 100,000 horsepower together with our obligation to complete this construction is a very fair contract, is more than a fair contract to the Government.

Mr. STOLL. Oh, Mr. Martin, the Government is giving you \$17,000,000, I believe it is, worth of work already done.

Mr. MARTIN. Yes, sir.

Mr. STOLL. Provided you go ahead and complete it. They give you the whole thing.

Mr. MARTIN. And we are giving the Government things of great value, too.

Mr. STOLL. Do you think that the Government should be under obligations to you after they give you this?

Mr. MARTIN. I am not saying the Government is under any obligations to us, but I am saying we are offering the Government a very fair contract.

Mr. STOLL. But that is not my question. My question was, do you consider the \$5,000,000, less the value of the steam plant, which is a going concern, the fair value you placed upon this property in your contract?

Mr. MARTIN. You have got to take the situation as a whole. We have not expressed it in terms of fair value of plant, or in terms of fair value of water power. We have expressed it as a whole. We offer the Government 100,000 horsepower and \$5,000,000 for these properties.

Mr. STOLL. I understand that, Mr. Martin; but when we had your contract up for consideration several members of the committee asked you what you meant by the fair value, and you would not say. Now, you make an offer in which you offer to buy this particular property over which you claim to hold an option, adding to that the steam plant.

Mr. MARTIN. We can not separate the two things.

Mr. STOLL. Now, I ask the direct question: Here is an offer you have made fixing a fair value for the steam plant, do you consider that to be the difference between the value of the steam plant and other property mentioned in your contract?

Mr. MARTIN. All I can say is this: In presenting this offer we balanced those situations and the values in one and the values in the other, and we have concluded that this is the basis on which we can make a reasonable proposal to the Government. That is the best answer I can make to you, Mr. Stoll.

Mr. STOLL. So you still decline to give an expression of that fair value?

Mr. MARTIN. I do not decline; I just tell you the basis on which we proceeded.

Mr. STOLL. But you do not do it. Now, referring to this map you have here showing this radius of 400 miles, what States are included in that radius?

Mr. MARTIN. Alabama, part of Georgia, part of Tennessee, part of Arkansas, part of Louisiana, and part of Florida.

Mr. STOLL. Does it go into the Carolinas?

Mr. MARTIN. I think it does. I think it does get to South Carolina.

Mr. STOLL. And part of North Carolina?

Mr. MARTIN. No; of course, it depends upon the situation.

Mr. STOLL. That is sufficiently definite. Have you listed the water powers in that territory?

Mr. MARTIN. No.

Mr. STOLL. You do not know the number of water powers in that territory?

Mr. MARTIN. No; I can only give you the United States Geological Survey's recent report on it. If you would like to have that I can put that in the record.

Mr. STOLL. No; that is all right. In that territory, how many water powers do you own?

Mr. MARTIN. We are only interested in powers in Alabama, Mr. Stoll.

Mr. STOLL. You have no options for any power outside of Alabama?

Mr. MARTIN. Not at all.

Mr. STOLL. How many do you own in Alabama?

Mr. MARTIN. We have two developed and a third in process of development, and there are several sites that sooner or later we hope we can develop in Alabama, depending upon the action of the Federal Power Commission. We have no sites of any consequence except those that may be developed under license of the Federal Power Commission.

Mr. STOLL. With those you own, if you got control of Muscle Shoals, you would have pretty much of a monopoly of the water power in that territory, would you not?

Mr. MARTIN. No; there are many water powers, of course, and Mr. Wright has referred to some of them.

Mr. STOLL. I know that, but I said that you would practically have a monopoly.

Mr. MARTIN. No; there are a great many water powers in Alabama in which we have no interest. Some of the most important water powers on the rivers there we have no interest in at all.

Mr. STOLL. I understand that, but I asked if you would have a practical monopoly.

Mr. MARTIN. We would have several large water powers, of course.

Mr. STOLL. But you do not think it would be a monopoly?

Mr. MARTIN. I do not think it would be a monopoly in the sense you are speaking of, and I just want to say this: You are familiar with the Federal water power act?

Mr. STOLL. Somewhat, although I am not an expert on it by a good deal.

Mr. MARTIN. I want to direct your attention to one provision of the Federal water power act, section 7, which contains this provision with reference to the power commission:

"Sec. 7. That in issuing preliminary permits hereunder or licenses where no preliminary permit has been issued, and in issuing licenses to new licensees under section 15 hereof, the commission shall give preference to applications therefor by States and municipalities, provided the plans for the same are deemed by the commission equally well adapted, or shall within a reasonable time to be fixed by the commission be made equally well adapted, to conserve and utilize in the public interest the navigation and water resources of the region; and as between other applicants, the commission may give preference to the applicant the plans of which it finds and determines are best adapted to develop, conserve, and utilize in the public interest the navigation and water resources of the region."

Now, my point in that connection is that the whole theory of the Federal water-power act is to develop to the maximum use all water-power resources with the idea of combining in one operation water powers in different watersheds, interconnecting them so that the greatest possible use can be made of the waters in different watersheds. It is the entire region, which, viewed from the standpoint of public interest, is involved.

Mr. STOLL. Oh, yes; but that could be done without one company owning practically the greater portion of the water power in a given territory.

Mr. MARTIN. And the engineers of the United States, who have examined this most closely, have concluded that the greatest possible advantage that could result to the public in this territory would be the development of this Muscle Shoals property and its interconnection with our system, with the Tennessee system, and with other systems in Tennessee and Georgia, and other Southern States. In no other way can you realize the greatest advantage from this development. As I explained to Mr. Wright, it is a question of diversity of stream flow, diversity of use between different sections of the South, and the time ought to come when all the water that flows in the Tennessee River will generate power up to the 600,000 horsepower every day in the year and pass over these lines to points of use. You can not do that throughout the year unless powers are interconnected in a great big system; otherwise, you lose a great part of the value.

Mr. STOLL. But that could be done without the Alabama Power Co. owning Muscle Shoals, could it not?

Mr. MARTIN. It can be done, provided the power is interconnected.

Mr. STOLL. I know, and I say it can be interconnected by other companies owning it.

Mr. MARTIN. Yes; by any one who develops it with that theory, but I have not seen any program here which indicates that any one is looking to that use, and, furthermore, there is a program pending, the very purpose of which is to consolidate this entire water-power situation into one hand, not for public use but for private use, and I will ask you the question, if that does not create a real monopoly, a monopoly where there is no regulation as to rates, as to service, as to security issues, or as to anything else.

Mr. STOLL. It does not do that because he is only getting one water power, and you have a great deal of other water powers.

Mr. MARTIN. You spoke of the question of monopoly. There is a monopoly of the greatest water-power situation in the South.

Mr. STOLL. An individual water power.

Mr. MARTIN. These two water powers, without any public regulation of any sort and made not upon the basis of interconnecting it and getting the greatest use out of it.

Mr. STOLL. Would you not have a bigger monopoly if you owned what you now owned and you owned Muscle Shoals in addition than Mr. Ford would have if he merely owned Muscle Shoals? You would have a bigger monopoly then, would you not?

Mr. MARTIN. No.

Mr. STOLL. With what you have now and with Muscle Shoals in addition?

Mr. MARTIN. Of course it would be a greater system, but it would be interconnected with other systems with a view to getting the greatest value out of it for the public. There is just a limited profit or return to those who put their money in this. It goes to the public to serve industries and individuals in their homes and in their industries in this great section.

Mr. STOLL. Mr. Martin, I think I asked you somewhat this same question before: If the Alabama Power Co. is so very, very anxious to serve the people down there, why is it that so many people in Alabama are so hostile to them? Why is it that the boards of trade and those who represent Alabama in Congress and everyone seems so much interested in the Alabama Power Co. not getting this project? If you are such a concern that your sole desire is to serve the people, why would they not be for you?

Mr. MARTIN. I agree that there are a good many people who at the moment take another view of this situation.

Mr. STOLL. Yes, sir.

Mr. MARTIN. But there are also thousands of people who look upon it just exactly as I am stating it to you—thousands of them—and that situation you are going to see expressed in Alabama first and last. You will see it expressed now by individuals, by newspapers, and by many members of the public at large.

Mr. STOLL. You heard the statement of the governor of Tennessee made before this committee, did you not?

Mr. MARTIN. No; I did not. I heard of it.

Mr. GARRETT. Mr. Martin, when did your board of directors meet and change their minds and decide they wanted to take over this Muscle Shoals proposition?

Mr. MARTIN. They did not change their minds at all about anything that is here expressed, Mr. Garrett?

Mr. GARRETT. Did you not write a letter to the Secretary of War, or rather your company, some time ago, saying you were not interested in the project at Muscle Shoals?

Mr. MARTIN. No, sir.

Mr. GARRETT. I mean a letter to the Chief of Engineers?

Mr. MARTIN. No, sir. On the contrary, we wrote him and told him we were interested and were prepared to go ahead and cooperate in its development along commercial lines.

Mr. GARRETT. But you made no proposition to do so definitely.

Mr. MARTIN. If the Congress was concerned in its development and use in public service, we told the Chief of Engineers we would be prepared to submit a plan.

Mr. GARRETT. What guaranty is there in your proposition, Mr. Martin, that your company will fulfill its contract and the offer it has made here?

Mr. MARTIN. What guaranty is there?

Mr. GARRETT. Yes.

Mr. MARTIN. In the first place, we have property and assets engaged in the public service to-day which are substantial. We have explained to the committee that there is a great demand for the further power in the southeastern section, and there undoubtedly will be a market for a sufficient volume of this power before the dam can be completed to justify its development.

Mr. GARRETT. I understand that, but suppose the Government accepts your proposal and enters into an agreement such as you have outlined here in your eight propositions, and you take out your license under the water-power act referred to, and then you do not do anything, what recourse has the Government of the United States?

Mr. MARTIN. To take the property back.

Mr. GARRETT. Yes; they can take the property back. We can always do that. Then how much better off are we then than we are now?

Mr. MARTIN. Well, you will not be any worse off, will you?

Mr. GARRETT. We may not be any worse off, but we have not gotten anywhere. Is that the purpose of your offer here, that you are playing with the Government for time?

Mr. MARTIN. No, sir; we are not playing with the Government for time.

Mr. GARRETT. What guaranty do you offer.

Mr. MARTIN (continuing). And if you want us to give a bond to-day of \$5,000,000 or \$10,000,000, we will be glad to do it. We are not playing with the Government.

Mr. GARRETT. But you do not say that in your proposal.

Mr. MARTIN. No, sir; because the law under which we propose to act carries with it the right of the Federal Power Commission to exact guaranties as to the financial responsibility of the proposed licensee, and you will notice that not only in the act, but the Secretary of War refers to it and says: "It is in the province of the Federal Power Commission to require such assurances and guaranties as may be necessary as to the financial ability of the licensee to complete its undertaking." We will comply with any request or demand made by the Federal Power Commission as to our financial ability to complete this undertaking.

Mr. GARRETT. That is very commendable, and what I want to know is this: This proposition of Mr. Ford's has been pending since the 8th of July, 1921, and after the hearings had been going on here for a week on his proposition, which was the only proposition that had ever come before Congress, you come forward now and show great anxiety to get this property, and you are willing to do anything the Government wants you to do in order to get hold of this plant. Why did you not do something before that?

Mr. MARTIN. Now, let us get the record straight. I think this proposal is dated some time in January.

Mr. GARRETT. No; Mr. Ford's first proposal is dated July 8.

Mr. MARTIN. Yes; but his last proposal is dated in January.

Mr. GARRETT. Yes; that was his first proposal, but I am referring to the last proposition he has submitted.

Mr. MARTIN. The one that is pending before the Congress is dated in January, as I recollect.

The CHAIRMAN. January 25, 1922.

Mr. MARTIN. Yes. We submitted our ideas on the subject in a letter to the Chief of Engineers in May. We again took it up with the Chief of Engineers by letter dated in July.

Mr. GARRETT. Now, let us keep the record straight as we go along. In those letters that you refer to did you make any definite proposition to the Government for the taking over of Muscle Shoals and carrying out the purposes for which the original project was started?

Mr. MARTIN. We stated in those letters that if the Government was prepared to consider a plan by which a part of the power would be devoted to public service, we were prepared to deal with it. As you know, of course—

The CHAIRMAN. Pardon me, in what year?

Mr. MARTIN. In the year 1921, and those letters point out the inhibition against proceeding now, that clause in section 124 of the national defense act, and hence there was not authority or power in the Government officers to deal with it at the time.

Mr. GARRETT. I did not catch that.

Mr. MARTIN. There was, as of course you know, the provision in section 124 of the national defense act, which provided that the plants or plant should be constructed and operated solely by the Government, and, of course, that made it impossible for us or anyone to make any arrangement or agreement.

Mr. GARRETT. Now, what I want to do is to get right down to the bottom of your proposition here, so far as the manufacture of fertilizer is concerned, to supply the agricultural interests of the country, and so far as the manufacture of nitrate of ammonia is concerned for ammunition purposes. You do not propose to have anything to do with that except to turn over to the Government 100,000 secondary horsepower, and the Government is to do that, if anybody does it, or name somebody to do it.

Mr. MARTIN. That is correct.

Mr. GARRETT. That is your position. So that under your proposition, so far as maintaining the nitrate plant No. 2 for munition purposes at all times for the use of the Government and keeping a force there and everything of that sort is concerned, and so far as making any fertilizer for agricultural purposes is concerned, you are not interested in that. You are going to leave that to the Government, if it can find somebody that will do that and your proposition

when stripped of everything else, including the 100,000 secondary horsepower, is a water right that you get for 50 years and nothing else.

Mr. MARTIN. We propose to give the Government the 100,000 horsepower and \$5,000,000 and the Government retains its nitrate plant.

Mr. GARRETT. The Government already has that.

Mr. MARTIN. And you have enough money out of this deal which, at 4 per cent, will maintain your nitrate plant in a state of efficiency.

Mr. GARRETT. Now, when you have done that and wound it all up, you have got the extension of your plant that the Government paid for with its own money—

Mr. MARTIN (interposing). And which we pay for.

Mr. GARRETT. I say you are going to pay for that which the Government has already paid for, but you will have that and you will have dam No. 2, and that will be yours absolutely.

Mr. MARTIN. No; I do not accept that.

Mr. GARRETT. I mean subject to the right of the Government to recapture—

Mr. MARTIN. Subject to the right of the Government at the end of 50 years by paying the net investment and not any added value by reason of any increase in value in the interim, but simply the net investment in the project.

Mr. GARRETT. But you have that for 50 years.

Mr. MARTIN. Yes.

Mr. GARRETT. Absolutely?

Mr. MARTIN. Yes, sir.

Mr. GARRETT. And both the steam plants, and all you have paid the Government will be \$5,000,000?

Mr. MARTIN. Plus the 100,000 annual horsepower.

Mr. GARRETT. Plus the 100,000 secondary horsepower.

Mr. MARTIN. Yes. In addition to that we pay the Government another very substantial item in that we relieve the Government of the obligation to maintain the dam and gates.

Mr. GARRETT. I understand that.

Mr. MARTIN. Yes.

Mr. GARRETT. But that is the only thing except maintaining the dam and gates and giving the Government the right to go through them for 50 years, and that is all the Government really has left under your proposition after you pay the \$5,000,000.

Mr. MARTIN. And we relieve the Government of the obligation of putting up from \$50,000,000 to \$80,000,000 more money in the project.

Mr. GARRETT. But you are putting that up with the idea of making a whole lot more out of it. I am speaking now from the Government's viewpoint, and you take out for fixing up the locks and dam. You deduct out of that total the amount for fixing those locks and dams; you deduct that from the \$5,000,000, do you not?

Mr. MARTIN. Of course, we can not make a lot of money out of it, because we are subject to the regulation of rates, and under the terms of the Federal water power act there is a provision limiting the terms and providing that if any earnings are made over and above that rate of return they are amortized to the United States Treasury.

Mr. GARRETT. What rate of return are you allowed under the Federal water power act on your investment?

Mr. MARTIN. The rate of return is fixed by the Alabama Public Service Commission.

Mr. GARRETT. That is another one of those "how old is Ann" propositions. What interest on your capital investment are you allowed to make?

Mr. MARTIN. It is not fixed that way.

Mr. GARRETT. Let us see if we can get at it this way. This is an awful big proposition you have submitted to the Government, and evidently your experts have it all figured out where your company would come out in the end.

Mr. MARTIN. We know it is a big proposition, Mr. Garrett, and a big responsibility; we appreciate that.

Mr. GARRETT. What do you figure your company is to make out of this in 50 years, after you have done everything you propose to do?

Mr. MARTIN. We did not figure it that way, Mr. Garrett.

Mr. GARRETT. You do not know whether it is a good proposition or a bad proposition?

Mr. MARTIN. We figured that we can sell power to the public at a rate depending upon what it will cost us to maintain the project and what money will cost us.

Mr. GARRETT. The conclusion of your company is that the proposition you make to the Government, if you can get hold of Muscle Shoals for 50 years, in connection with your other holdings which you have in that section of the country, which will almost if not quite give you a monopoly of power in all of those circles you have on that map—you figure you can dispose of so much of it so that as a business proposition it will be a tremendously good thing for you?

Mr. MARTIN. If we were in a manufacturing business I would like to have it without regulation, because we really could make some money out of it.

Mr. GARRETT. The regulations allow you to make some.

Mr. MARTIN. But not much.

Mr. GARRETT. You have made a whole lot of it?

Mr. MARTIN. No; we have made enough money out of it to pay the fixed charges on our obligations, with a modest surplus.

Mr. GARRETT. Have you your financial arrangements all made to handle this proposition?

Mr. MARTIN. Substantially; we have an understanding with our bankers, and we think we will be able to find the necessary money.

Mr. GARRETT. You think you have an understanding. You do not guess at those things. You know you have, do you not?

Mr. MARTIN. We have an understanding.

Mr. GARRETT. What bankers have told you they would finance this proposition?

Mr. MARTIN. Not banks; they are concerns whose business it is to do this very kind of work—investment bankers. Harris, Forbes & Co. and Coffin & Burr are the two firms. They make a business of finding money for high-grade public service institutions such as ours.

Mr. GARRETT. Have they told you they thought they could find it, or that they could find it?

Mr. MARTIN. That is our agreement with them.

Mr. GARRETT. You will have to bond those concerns?

Mr. MARTIN. Certainly.

Mr. GARRETT. And sell those securities?

Mr. MARTIN. Yes.

Mr. GARRETT. You do not know whether you will have to sell them at home or abroad, do they know?

Mr. MARTIN. No, sir; but I think they will sell some in your State and some in mine, and sell some throughout this Nation.

Mr. MILLER. Mr. Martin, you are acquainted, of course, with the actual condition now of the Warrior extension.

Mr. MARTIN. Yes, sir; I think so.

Mr. MILLER. You are acquainted with it perhaps as well as any living man, as to its present value, its position, its preservation, and perhaps you are the best acquainted man as to its value as a going concern, and as a part of your organization. Your company is the lessee of it now?

Mr. MARTIN. In a technical sense we are not the lessee, we are in possession of it, under the terms of the contract, and operate it under that contract.

Mr. MILLER. Under the contract of December 1, 1917?

Mr. MARTIN. Yes, sir; that contract requires us to maintain and operate it as a part of our system.

Mr. MILLER. How much rental do you pay?

Mr. MARTIN. We pay a mill and a half a kilowatt hour produced.

Mr. MILLER. What does that amount to in a year.

Mr. MARTIN. It depends upon the production.

Mr. MILLER. What has it amounted to?

Mr. MARTIN. Last year it was something in excess of \$75,000. This year it will probably be twice that amount.

Mr. MILLER. Last year you paid something on a basis of 1½ per cent on the construction cost, amounting to \$4,800,000. One and one-half per cent of that would be approximately \$74,800, so that you paid approximately 1½ per cent.

Mr. MARTIN. Yes. And we have also maintained it. That is based on the investment in the plant and substations. The Government takes power from us now at the station and hence carries the investment in the line.

Mr. MILLER. You are also acquainted with the power plant at nitrate plant No. 2.

Mr. MARTIN. I do not know very much about that.

Mr. MILLER. But your men do.

Mr. MARTIN. Our people do, of course.

Mr. MILLER. Are you the lessee of that?

Mr. MARTIN. Yes.

Mr. MILLER. What are you paying for that, about how much?

Mr. MARTIN. Ten thousand dollars a month plus the energy charge for the energy generated.

Mr. MILLER. It is very clear to observe from your offer that you have picked out such units of the Government property in and about Muscle Shoals as will fit in with your business as a manufacturer of power.

Mr. MARTIN. Yes, sir.

Mr. MILLER. And have rejected those which are not and could not be made a part of your system.

Mr. MARTIN. Supplying the Government in lieu of those units—

Mr. MILLER (interposing). I am not talking about that. We will get back to that in a little bit. So this is a good-sized bill—\$5,000,000—you are going to pay for those units and also the transmission lines from Warrior to Muscle Shoals. By the way, my curiosity has been aroused over that contract of December 1, 1917. Why were you so particular for the Alabama Power Co. to own that right of way?

Mr. MARTIN. I do not know that I was particular about it. There was an officer advising the Government in the beginning that it did not have the power at that time to purchase land.

Mr. MILLER. Who in the world gave such comforting information that the United States Government had no right to own lands?

Mr. MARTIN. Later on there was a statute passed under which the Government could acquire land for its various military and public purposes.

Mr. MILLER. Just on that point—and I do not mean to get away from the point I was asking about, referring to your contract of December 1, 1917, you provided in that contract that in building the Warrior extension, the Warrior substation you acted as the agent of the Government?

Mr. MARTIN. Yes.

Mr. MILLER. And considering the building of the transmission as part of the Warrior substation project, in order to get the benefit out of that, I notice this very significant language is there, in article 3 of your contract of December 1, 1917: "The contractor shall, subject to the approval of the contracting officer, at the sole expense of the contractor." That is the only time that expression has been used in your contract of December 1, 1917, from beginning to end. I have wondered why you were so careful to get title to that right of way in the Alabama Power Co. Why not let the Government have the right of way?

Mr. MARTIN. I think it imposed a burden upon us.

Mr. MILLER. That is not for us to say. I am asking you as a lawyer, who drew this agreement, or was interested in it, or as president of the power company, or as one of the gentlemen who signed the agreement, why you did that?

Mr. MARTIN. I expect you will find those words were inserted, and that language was inserted by the Government officer himself.

Mr. MILLER. You want to buy, for the language is at your sole consent, the right of way, but you were to build the transmission line as the agent of the United States Government. That is right, is it not?

Mr. MARTIN. Yes.

Mr. MILLER. That is compatible with what I asked you several days ago as to the interlocking and lockstitching this thing altogether, is it not? Suppose the transmission line, both the right of way and the title to the power line, belonged to the United States.

Mr. MARTIN. We had 30 miles of it, and had lines on it.

Mr. MILLER. That went as far as Jasper, and from Jasper on it is 88 miles.

Mr. MARTIN. Sixty-eight miles. You have to weigh the question of time. Having 20 miles of the way cleared, you could begin to build the transmission line the next day, but when you have to buy a clear title through an undeveloped district it is a very different problem. This transmission line, or the construction of the transmission line, was begun within a week after the Government asked us to undertake it. There was 20 miles clear. That was worth a great deal in the emergency; it enabled us to get power to Sheffield at a very much earlier date than otherwise.

Mr. MILLER. That is not answering my question. You could have bought the right of way as an agent of the United States from Jasper to Muscle Shoals as cheaply as you could have bought it for yourselves.

Mr. MARTIN. You mean from Jasper to Muscle Shoals?

Mr. MILLER. Yes; from Jasper to Muscle Shoals.

Mr. MARTIN. Of course, we could have.

Mr. MILLER. As cheaply as agents of the United States Government, as you could have bought it yourselves?

Mr. MARTIN. Just as cheaply. But we were asked to buy it by the officers of the Government themselves, or by one of the officers.

Mr. MILLER. Who was that gentleman who gave you that advice?

Mr. MARTIN. That was Maj. Runcie.

Mr. MILLER. What is his first name?

Mr. MARTIN. I have forgotten his name now.

Mr. MILLER. Was he a Regular Army officer or an emergency gentleman?

Mr. MARTIN. He was an officer of the Government at that time. I do not think he was in the service.

Mr. MILLER. He was not in the service?

Mr. MARTIN. He was a civilian adviser in the department at that time.

Mr. WEATHERS. May I say, Mr. Miller, he was a retired Army officer who had been engaged in the practice of law for many years?

Mr. MILLER. You did not have to go to a lawyer to get advice on a question like that?

Mr. WEATHERS. The Government officials naturally brought their law talent into this situation from the very start. In the initiation of the negotiations Maj. Runcie was the lawyer in charge of the interests of the Government. Maj. Runcie had been a Regular Army officer and had retired and practiced law for many years. When the war began he evidently returned to the service and was stationed in Washington in charge of this particular negotiation at the start.

Mr. MILLER. I wonder where he can be found now.

Mr. WEATHERS. I heard yesterday that he is now librarian at West Point.

Mr. MILLER. He is the gentleman who advised you that it was quite unnecessary for the Government of the United States to buy the right of way?

Mr. WEATHERS. He was the gentleman who raised the question as to whether at that time there was any legal authority for the United States to acquire this real estate upon which to build this plant. I would not say that he definitely advised that it could not.

Mr. MILLER. I am wondering, if there was ever such a limitation, how we acquired any land to build these nitrate plants on or do anything.

Mr. WEATHERS. This was in November, 1917?

Mr. MILLER. Yes.

Mr. WEATHERS. We had been in the war only a little while.

Mr. MILLER. We had been in the war for several months, since April, 1917.

Mr. WEATHERS. Most of the legislation came after that, I think.

Mr. MILLER. But such a thing is perfectly consistent with every other interlocking proposition connected with the interlocking of the United States property with the property of the Alabama Power Co.?

Mr. WEATHERS. Perfectly consistent.

Mr. MILLER. And fits in very nicely with that situation.

Mr. WEATHERS. That is right.

Mr. MILLER. If anyone has that purpose in view?

Mr. WEATHERS. That is right.

Mr. MILLER. Let us go back to the other proposition. Let me read, if you please, Mr. Martin, paragraph 3 of your offer. It says, "To purchase the Government's interest in the Warrior extension of the steam plant of Alabama Power Co. and facilities." What particular facilities have you reference to in the use of the Warrior facilities in that connection?

Mr. MARTIN. There is a substation there, and then the Government has an interest in the railroad extension.

Mr. MILLER. You mean the Drifton Railroad?

Mr. MARTIN. Yes.

Mr. MILLER. What becomes of your 25-year easement you have on that? Under the contract of December 1, 1917, you have a 25-year easement on that, have you not?

Mr. MARTIN. I really do not remember about that.

Mr. MILLER. You know your own contract, do you not?

Mr. MARTIN. I do not recall that particular question.

Mr. MARTIN. It is in here. I am getting back to the significance of the word "facilities," following this Warrior extension and steam plant proposition. You say that includes the Drifton Railroad?

Mr. MARTIN. That is the only thing I recall.

Mr. MILLER. What connection has that Drifton Railroad with the general scheme down there? It runs out to what property?

Mr. MARTIN. It runs from this plant to what was previously the end of the Southern Railroad line.

Mr. MILLER. It furnishes a railroad connection into your Warrior steam plant?

Mr. MARTIN. Yes; the Southern Railroad had a line running out from its main line to a mining district, and this was an extension of one of those branch lines to this plant.

Mr. MILLER. That would carry the Drifton Railroad?

Mr. MARTIN. Whatever that interest is.

Mr. MILLER. Let us see how much we put into the Drifton Railroad. According to the report of the Secretary of War it was \$50,421. There has been more money than that which has gone into railroad, has there not?

Mr. MARTIN. We put \$105,000 into it.

Mr. MILLER. Let us take the next part of this paragraph, "the Warrior and Sheffield substations"; we know what they are. Then there is the "transmission line from Warrior to Sheffield." That is the same transmission line concerning which it was considered illegal for the Government to go in and acquire it, so you took it. Then there is the steam plant at nitrate plant No. 2. How much land goes with that? Was it merely the land on which the plant stands, or is there any considerable acreage there?

Mr. MARTIN. You would have to look at the map to see. It was just enough acreage to maintain the plant, and then there is the substation and some housing facilities.

Mr. MILLER. It has some rather extensive dumping facilities, coal bunkers, and things of that kind, some of which are built of concrete and very valuable. All of that stuff goes with it?

Mr. MARTIN. No; just the things necessary to make the plant an operating plant.

Mr. MILLER. You can see how a dispute could arise between the Government and yourselves in determining what you shall get.

Mr. MARTIN. We will assume that when the time comes to make arrangements of this kind there will be a definite marking of the things included and those not included in this arrangement. That is a matter very easily determined.

Mr. MILLER. Then you say, "together with the necessary rights of way, lands, and housing facilities." What are the housing facilities?

Mr. MARTIN. You have to have a staff at a plant like this. Those are for operatives. There are a number of houses around this plant built for the men who will operate the plant.

Mr. MILLER. On whose property do those houses stand?

Mr. MARTIN. The United States Government's.

Mr. MILLER. The property of the United States Government? How could we acquire property on which to build houses if we could not acquire property on which to build a transmission line?

Mr. WEATHERS. That was six months later.

Mr. MILLER. Did this same gentleman advise you that the United States could acquire property on which to build houses but could not acquire property on which to build transmission lines? Is that what we are to understand?

Mr. MARTIN. All I know is what happened in connection with the Warrior situation.

Mr. MILLER. Was this same gentleman, Mr. Runcie, down there when the houses were built; were they built before or after the transmission line was acquired?

Mr. MARTIN. I do not remember that.

Mr. MILLER. Then the housing facilities were on the land of the United States. I did not know we owned any land around the Warrior station. Are these housing facilities there or at Muscle Shoals?

Mr. MARTIN. Both.

Mr. MILLER. Did we buy some land down there around the Warrior steam plant to build houses?

Mr. MARTIN. No. Those were some temporary houses on land of ours covered or leased from the power company in this contract.

Mr. MILLER. No houses were built on the land of the Alabama Power Co., were they?

Mr. MARTIN. Yes; some housing facilities for the operatives.

Mr. MILLER. Are those housing facilities that were passed by title to you?

Mr. MARTIN. You would have to look at the map to see.

Mr. MILLER. Would they take the land with them?

Mr. MARTIN. I suppose they would—you mean at nitrate plant No. 2 or at the Warrior plant?

Mr. MILLER. At the Warrior steam plant.

Mr. MARTIN. The Government does not own the land.

Mr. MILLER. It owns no land there; that is what I was getting at a little bit ago. But the houses were built or constructed by the United States Government.

Mr. MARTIN. This investment is included in the \$4,900,000.

Mr. MILLER. Then your contract says "and to pay therefor in five equal installments the sum of \$5,000,000, less an amount to be agreed on to cover the cost of locks and navigation structures at Wilson Dam." What is your information as to what deduction that will be?

Mr. MARTIN. Two million five hundred thousand dollars.

Mr. MILLER. Then that leaves \$2,500,000 for you to pay?

Mr. MARTIN. Yes, that is right; to pay the Government.

Mr. MILLER. Then you are getting for \$2,500,000 the Warrior steam plant extension and substation, the transmission line, the substation at Muscle Shoals, and the steam plant at Muscle Shoals, and the Drifton Railroad?

Mr. MARTIN. No; we are getting them for \$5,000,000, plus 100,000 horsepower.

Mr. MILLER. I am not talking about horsepower; I am talking about the money transaction.

Mr. MARTIN. You can not separate them.

Mr. MILLER. Yes; we can separate those all right; we will separate them.

Mr. MARTIN. You can not separate them as a business proposition.

Mr. MILLER. You are getting them for a money consideration of \$2,500,000.

Mr. MARTIN. If the Government wants to accept our proposition as a whole, that is part of it.

Mr. MILLER. Now, you get the steam plant in which we put \$4,987,000 at the Warrior plant, and approximately \$12,000,000 at nitrate plant No. 2; is that not about right?

Mr. MARTIN. Whatever the record shows.

Mr. MILLER. Then it would amount to approximately \$17,000,000 worth of machinery, at war-time prices, of course, of electric power producing machinery?

Mr. MARTIN. No; you understand, Mr. Miller, that the dam is only partially completed.

Mr. MILLER. I am not talking about the dam; I did not mention the word "dam." I say you are getting the \$12,000,000 we put in at nitrate plant No. 2, the steam plant, and \$5,000,000 in the Warrior steam plant, which makes approximately \$17,000,000 worth of equipment of steam-producing energy for \$2,500,000?

Mr. MARTIN. I can not accept your premise.

Mr. MILLER. I am talking about the money consideration. Of course, we have differed in many things, but that is the cold, God's honest truth so far as what you pay is concerned, is it not?

Mr. MARTIN. Suppose we do not get the lock.

Mr. MILLER. That is what you pay in cash?

Mr. MARTIN. If we pay that much cash we build the lock, which is \$2,500,000, and give it to the Government.

Mr. MILLER. You do what?

Mr. MARTIN. We build the lock and convey it in fee to the Government on the completion of its construction; we agree to convey it.

Mr. MILLER. You build the lock?

Mr. MARTIN. Yes; and we agree to convey to the Government in fee the lock on completion. Then that money which goes into the lock is part of the money which we put up and must be taken into account as a part of the \$5,000,000.

Mr. MILLER. And be deducted therefrom?

Mr. MARTIN. Yes; we convey to the Government that equipment.

Mr. MILLER. You pay to the Government \$2,500,000 in the cost of the lock and \$2,500,000 in cash. Let us take it that way. The steam plants we are turning over to you cost the Government approximately \$17,000,000, which you are paying for partly in a lock and partly in cash to the Government?

Mr. MARTIN. And power.

Mr. MILLER. That would leave it this way: Taking into consideration the \$2,500,000 deduction for the lock, you then very clearly have figured that the balance of \$2,500,000 shall be the payment for these other things.

Mr. MARTIN. No.

Mr. MILLER. How do you figure it. or did you figure it in reference to that?

Mr. MARTIN. We just figured the money which we could afford to pay, plus the 100,000 horsepower.

Mr. MILLER. You did not figure it as completely at random as that, did you? Your men figured out this thing, did they not? Did they not appraise the value of the Warrior steam plant to you in carrying out your purposes?

Mr. MARTIN. I can only answer what I stated, that we have presented it as a whole. We propose to give the Government 100,000 horsepower and \$5,000,000 for the property. That is the way we figured it out, and that is the best answer I can make to you.

Mr. MILLER. You can not give us any idea at what your company, in figuring this thing out so that you could make this proposition to the Government, valued the steam plant at the Warrior substation?

Mr. MARTIN. I have given you the best answer I can.

Mr. MILLER. What did you say?

Mr. MARTIN. The whole proposition you have to take together. It is a question of financing the whole situation to completion, of raising the money and providing the Government with 100,000 horsepower and paying the Government \$5,000,000. You have to recognize all those things as balancing one against the other.

Mr. MILLER. But, Mr. Martin, I presume every man around this table has more or less figured in propositions of this kind and he has brought in, in making up his figures, all the items in connection with various things all the way down, and then, taking a complete schedule and making the proposition based on that. Is not that the way it is done?

Mr. MARTIN. Mr. Miller, I have told you over and over again that all we did was to consider this situation as a whole. We have made a proposition to give the Government power and complete the financing and construction of this job and pay \$5,000,000 in money. We can not separate one from the other because we did not make our calculations that way. and here we are.

Mr. MILLER. Is there any electrical energy generating machinery at nitrate plant No. 2 that would be included in this transfer to you?

Mr. MARTIN. There is the steam plant.

Mr. MILLER. All of the generating machinery there and at the Warrior River extension—all of that machinery is in good condition, and you are paying a rental of \$10,000 a month for that extension?

Mr. MARTIN. Yes; it is located 90 miles from our Warrior plant.

Mr. MILLER. It is a permanent form of construction, brick buildings, and all those things?

Mr. MARTIN. Yes.

Mr. MILLER. What did you or your engineers figure was included in the steam plant at nitrate plant No. 2? You certainly had some idea as to whether there was 1 acre or 10 acres of land?

Mr. MARTIN. I do not know that it was figured as a matter of acreage. It would be whatever is reasonable and necessary to maintain a plant and operating facilities and facilities for the men.

Mr. MILLER. Is that as close as you can come to it?

Mr. MARTIN. No, sir. If you were preparing a deed, and it was a question of making a deed ready for signature and execution, we would, of course, be more exact. All of those things are easily adjusted, because I assume we would go into it more carefully than we could do it here to-day. It has to work itself out.

Mr. MILLER. That more than excites my curiosity. That contract of December 1, 1917, is so very much in detail and every possible thing covered that could possibly be included in a contract, and then when it comes to this transaction you are so very general. That excites my curiosity. I do not mean any reflection on you. I wondered if you had not figured things down to the same nicety in this proposition you are making now that you figured on the contract of December 1, 1917.

Mr. MARTIN. I do not suppose we devoted five minutes to the question of how much acreage was involved in the Sheffield steam plant.

Mr. MILLER. Then it is a mere matter of indifference as to how much it involves?

Mr. MARTIN. No; because it was simply expressed as so much land and housing facilities. Any two men familiar with steam-plant operation could agree in an hour's time on what is necessary and what is not necessary.

Mr. JAMES. The Alabama Traction, Light & Power Co. (Ltd.) is a Canadian corporation?

Mr. MARTIN. Yes, sir.

Mr. JAMES. What is the capital stock of that company?

Mr. MARTIN. I think it is \$17,000,000 in common stock.

Mr. JAMES. The Alabama Power Co. is a subsidiary concern of the Alabama Traction, Light & Power Co. (Ltd.), is it not?

Mr. MARTIN. Limited in that relation.

Mr. JAMES. Which company will handle this proposition, the Canadian company or the Alabama Power Co.?

Mr. MARTIN. The Alabama Power Co. The Canadian company is no longer a business factor in the situation because it came into it prior to 1914 simply as a company through which we could raise money abroad. The conditions have entirely changed since 1914, and that company is not in such relation to our company or to the public as that it can command money on its securities.

Mr. JAMES. Is not the Alabama Power Co. a subsidiary of the Alabama Traction, Light & Power Co.?

Mr. MARTIN. Yes; I have explained that at great length.

Mr. JAMES. How long have you had your home office in Birmingham?

Mr. MARTIN. Since 1912.

Mr. JAMES. How do you account for the people down there considering your company a foreign corporation—that is, the people of Birmingham?

Mr. MARTIN. Propaganda which emanates from people who are opposed in Washington to our proposition.

Mr. JAMES. Did they not have a mass meeting down there the other night, with about 3,000 representative people present, and adopt resolutions stating that your company was a foreign corporation?

Mr. MARTIN. When?

Mr. JAMES. About a week or ten days ago.

Mr. MARTIN. I think there was a meeting held there and the man, or one of the men, who had the most to do with getting it up is one of the men who has been in this very hearing advocating another proposition as opposed to ours—Mr. J. W. Worthington. He had more to do with getting up that meeting than anybody else.

Mr. JAMES. There were about 3,000 people there, as I understand it.

Mr. MARTIN. I do not know how many there were.

Mr. JAMES. The resolution states that this is a foreign corporation.

Mr. MARTIN. And the resolution is untrue; the Alabama Power Co. was organized under the laws of the State of Alabama.

Mr. JAMES. How long since Mr. Washburn was president of the Alabama Power Co.?

Mr. MARTIN. I have answered that before; he resigned as president of our company in the year 1915.

Mr. JAMES. Do you know when he was president of the American Cyanamid Co.?

Mr. MARTIN. I think the record shows that, too.

Mr. JAMES. He was president of both companies at the same time, was he not for a while?

Mr. MARTIN. I think he was prior to the year 1915.

Mr. JAMES. President of both companies?

Mr. MARTIN. For one or two years about that time.

Mr. JAMES. Do you consider Mr. Ford's offer as dated January 26, 1922?

Mr. MARTIN. The offer which as I understand it is being considered by the committee is so dated.

The CHAIRMAN. It is dated January 25, 1922.

Mr. JAMES. He started to deal with the Government about last July.

Mr. MARTIN. Yes, sir; and we started to deal with the Government in 1913.

Mr. JAMES. Really his offer is the offer of last July, modified?

Mr. MARTIN. Yes, sir.

Mr. FIELDS. Mr. Martin, I would like to follow Mr. Miller's inquiry a little further in reference to Maj. Runcie. You say he had been practicing law, that he was retired from the Army and was practicing law?

Mr. WEATHERS. Yes.

Mr. FIELDS. Where did he practice law?

Mr. WEATHERS. I knew of him practicing law in Cuba. I know he also practiced law in this country.

Mr. FIELDS. Do you know what city in this country?

Mr. WEATHERS. I do not know.

Mr. FIELDS. Do you know whether or not he practiced law in New York?

Mr. WEATHERS. No; I do not.

Mr. FIELDS. You could not name any city in this country in which he practiced law?

Mr. WEATHERS. No.

Mr. FIELDS. I am asking you these questions because it is a little strange to me, unless this officer was not from New York, that each of the emergency officers who had to do with this contract came from the city of New York, two of them from one institution, and I am just wondering if this man—I do not know how they happened to be detailed there—was from New York, too.

Mr. WEATHERS. Maj. Runcie was as punctilious a man as you ever saw. He had all the traditions of the Regular Army.

Mr. FIELDS. I just wanted to know where he was from.

Mr. WEATHERS. I do not know where he was from originally.

Mr. MARTIN. I would like to correct the record there. I do not know of any two men from the same institution in New York.

Mr. FIELDS. It was stated that Lieut. Col. Williams and Lieut. Col. McRoberts were both from the National City Bank. That was developed at different times, I think.

Mr. MARTIN. There was a question asked, and I will correct it here, so far as anything I know is concerned. Lieut. Col. William Williams was a lawyer, practicing in New York City. If he ever had any connection with banks I know nothing of it. I knew nothing about him until he came into these negotiations as a lawyer representing the Government. His office is in New York, at 15 Broad Street.

Mr. FIELDS. I believe he is in Japan at the present time?

Mr. MARTIN. He has nothing to do with any bank that I know anything about. So far as Mr. McRoberts is concerned, I never heard of a Mr. McRoberts in connection with this contract, and I do not think his name appears in any connection with any of the contracts.

Mr. FIELDS. Possibly he was connected with the Air Nitrates Corporation contract.

Mr. MARTIN. That may be.

Mr. FIELDS. I think what I have referred to was brought out in a question propounded by Mr. Qulin. He asked a question if that bank was not a Rockefeller bank, and that is the reason why I remember that particular proposition.

Mr. MARTIN. Of course, questions oftentimes are asked with the idea of leaving an impression on the record which the witness can not answer and does not answer, and the question is left on the record. That has been the case with many questions asked here.

Mr. FIELDS. No; I think most questions asked here have been asked in a spirit of fairness, and they have been asked in an effort to get information that the committee was entitled to.

I would like to get a little more information about this lock you are to build in Dam No. 2, which you estimate will cost \$2,500,000. Of what value will that be to the Government without the completion of the navigation project on the Tennessee River? Will it be of material value to the Government?

Mr. MARTIN. It will be just as valuable to the Government as are the present canals in that stretch of the river; it will be just as valuable to the Government as would the lock facilities at Dam No. 3.

Mr. FIELDS. But the lock at each dam would be more valuable if both dams were built.

Mr. MARTIN. Yes; and they would all be more valuable if you built the other five dams in the other stretch of the river, which needs improvement.

Mr. FIELDS. The lock would not be as valuable if only one dam was constructed as it would be if No. 3 and possibly the other dams were constructed.

Mr. MARTIN. It will not serve with real usefulness until Dam No. 1 is built, then Dam No. 2, and then you have to build Dam No. 3, and then the five other dams referred to this morning. When all these eight dams are built the dam will serve its full usefulness.

Mr. FIELDS. It will not serve its full usefulness or be of very much service to the Government unless Dam No. 3 is constructed, which will enable traffic to get over the shoals.

Mr. MARTIN. That is true. It will not really serve its full usefulness, as I say, until the entire stretch of river is improved.

Mr. FIELDS. I am trying to find what return the Government will get from the \$2,500,000 which you estimate it will cost, and which Col. Cooper estimated at \$4,500,000.

Mr. MARTIN. I think you will find that the \$4,500,000 includes other lockage facilities. Of course, as a matter of engineering, it is desirable to complete the work while it is in progress.

Mr. FIELDS. I believe it was your contention that your company needs the Muscle Shoals power to supply the country that you are now supplying, the country contiguous thereto, which could be supplied with the kind of service the public now gets?

Mr. MARTIN. Yes, sir; we think we are rendering there a very high degree of public service.

Mr. FIELDS. In the last few days I have been reading a book entitled "Water Powers of the World," from which I find that Muscle Shoals is the greatest source of water power east of the Mississippi River, and possibly in the Mississippi Valley, and also possibly greater than any in the United States outside of the Columbia River in the West. I also find that in this territory where you are operating there is yet a great deal of undeveloped power. I realize the necessity of an ample supply of the character of service you are giving, but it has occurred to me that the whole public would be better served by the development of these lesser sources of supply for that character of service, and that we should have the development of one of the greatest assets in water power, in whole or at least in part, for the production of fertilizer.

Coming down to that point, the difference I see between your offer and Mr. Ford's offer is this: He binds himself to operate that plant at its maximum, which would possibly require primary horsepower, would it not, if he operates it continuously? He can not depend upon secondary power to do so.

Mr. MARTIN. I do not so understand it, Mr. Fields.

Mr. FIELDS. If that be true, he is to devote 100,000 primary horsepower, which, on the basis of cost presented to the committee by Col. Cooper, would be \$287,300 a year, where your 100,000 secondary horsepower would be worth, at the maximum, \$78,000.

Mr. MARTIN. If you are going to put the primary power in that position, where do you come out on fertilizer?

Mr. FIELDS. The thing that has been worrying me all the time, with the great plant like nitrate plant No. 2 at Muscle Shoals, with the steam power sold away from it, which your proposition would do, and left solely dependent upon 100,000 secondary horsepower—I am wondering whether anybody in the United States would take hold of it under a handicap of that kind.

Mr. MARTIN. Let us take your idea of using primary power in the manufacture of fertilizer. When it comes to the question of setting up your costs on the manufacture of fertilizer, what are you going to charge primary power in for? It has a sale value of \$25 per horsepower per year. If you put primary power in at \$25 per horsepower per year you will find you can not give away your nitrates, much less sell them, because the price for power will make the ultimate cost prohibitive.

Mr. FIELDS. I see the advantage of having it altogether instead of having it separate. Having it altogether, it would be operated in the main by secondary power, or possibly secondary power supplemented by steam power.

Mr. MARTIN. If you want to put it on that basis, here is a steam plant capable of generating steam power, and we will sell anybody who wants to make fertilizer there all the steam power he wants or needs cheaper than he can manufacture it himself. That plant is there, always subject to public regulation and anybody can buy the steam power.

Mr. FIELDS. The Government or the lessee would have to buy it, and the thing that has been running through my mind is—

Mr. MARTIN (interposing). How much steam power you want.

Mr. FIELDS. Would anybody lease this plant under limitations of that character? I fear they would not.

Mr. MARTIN. You can buy all the steam power you want; that is to say, you can buy the coal or so much power for this plant for as many days and months as you want it for the manufacture of fertilizer or anything else and not be

under any obligation for the maintenance and upkeep of the plant. That is the business of a public service company, Mr. Fields. With the steam plant there in the hands of a public service company that can always respond to a call of that character, with secondary power there at any price the Government sees fit to make it, available for nothing, if you want it, every facility is made available for whoever wants to go there and manufacture fertilizer.

Mr. FIELDS. But viewing it in my mind from the standpoint of the agricultural interests of the country, there is a great difference between making the production of nitrogen the first consideration and operating the whole thing combined and developing it, and making the production of nitrogen the second and last consideration.

Mr. MARTIN. Let me suggest this to you: Take the case of coal mines down in Alabama or somewhere else. In Alabama the coal industry has developed remarkably in recent years. Our company is supplying power to-day to 40 or 50 coal mines, large and small, with which to operate the trolley cars, with which to pump the water in and pump the water out, and to conduct all of the direct and incidental operations around the plant, in lieu of what? In lieu of the steam power which the mines had been accustomed to use in the past, and we are selling that power to those mines cheaper than they can manufacture steam power at their own mines and with their own coal right at their mines, delivering it hundreds of miles away to mines for use in the mining of coal.

There is another instance where we are selling a cotton mill in our State, one of the largest in the United States, this power. It bought its coal and set up its plant at the mouth of the coal mine. That plant is closed down and we are generating and delivering power to that cotton mill for the operation of its entire facilities much cheaper than it can manufacture power from its own plant at the coal mine. We are to-day serving power for all the cotton industries in Alabama, with the exception of two plants, north and south, every company; serving them power from a central station. Why do they take it? Because they can get it cheaper.

Mr. FIELDS. You stated that if the operator of plant No. 2, whether the Government or a lessee of the Government, should need steam power to supplement secondary power which you are to furnish, you are to furnish it to that operator. I believe you have stated that the price of power would probably continue to go higher, so if there should be an increase in the price of power from time to time he would have to pay the market price at the time he used the power. Do you think that any man would enter into a contract with the Government as a lessee, or do you not think the very fact that if he wanted to operate this plant continuously he would have to depend a portion of the time upon steam power which he must purchase from you, not knowing what the price might be in the future—that he would consider that an item of very great concern? Would not you as a business man, or any other man, so consider it?

Mr. MARTIN. No; when you get into this question of power there are certain fixed determined elements involved.

Mr. FIELDS. Based upon present-day conditions.

Mr. MARTIN. Take the water-power development.

Mr. FIELDS. We do not know what it will be 25 or 40 years hence.

Mr. MARTIN. That is very true, and when you come to fix the price for power, the value of power 40 years hence, that question goes back in part to the original cost of the property.

Mr. FIELDS. You are referring to hydroelectric power; you are not referring to steam power.

Mr. MARTIN. Your question is—

Mr. FIELDS (interposing). With this additional cost.

Mr. MARTIN. Your steam power to be used to supplement water.

Mr. FIELDS. Yes. You can realize that there may be in the future a very great difference in the cost of power.

Mr. MARTIN. Nevertheless, when you come to your question of additional cost, if you please, of steam power, in percentage of the whole cost it would be very small, that is the mere additional cost, in the total cost of the fertilizer to the public, and it may be an element or it may not be an element. Relatively, there would be very little steam power used. You are going to find before you get through with these investigations that the idea of making this nitrate fertilizer, following the cyanamid process, is not going to be the process that is going to survive. It is going to be a process which is going to use a less volume of power with greater efficiency.

Mr. FIELDS. Regardless of the amount of power used, if it is desired to operate continuously, and you can secure hydroelectric power for only 10 months out of the year, they must supply themselves with steam power for 2 months out of the year. That is one-sixth of a year, and it would become a very great element in the operation of the plant and in the cost of the product.

The CHAIRMAN. Gentlemen of the committee, Mr. Dent, I understand, is staying here to-day to allow an Army officer to be heard to establish some facts that Mr. Dent desires to establish, and I hope we can let him get away by half past 4.

Mr. McKENZIE. Mr. Martin, your proposition, of course, means that you will construct the dam under the Federal water power act?

Mr. MARTIN. Yes, sir.

Mr. McKENZIE. That being true, will you be obligated to pay to the Government any fees, such as license fees, or will there be any expense to you in that connection?

Mr. MARTIN. I am very glad you mentioned that. That is true.

Mr. McKENZIE. You have taken that into consideration?

Mr. MARTIN. Yes; that has been taken into consideration. There is a large site fee, based on the horsepower capacity of the stream.

Mr. McKENZIE. The items you are to purchase and the cost have been gone over many times, and I do not care to go into them in detail at this time, but I want to ask you whether or not it is a fact that the primary horsepower you expect to get from this development is the main consideration leading you to make the proposition which is now before us?

Mr. MARTIN. That is so, of course.

Mr. McKENZIE. In coming to a conclusion in this matter have you taken into consideration what effect it may have upon the stocks of the Alabama Power Co.?

Mr. MARTIN. I can not say that we have.

Mr. McKENZIE. You did not take into consideration the fact that this plant being the greatest water power in the South and located as you have indicated it on the map, permitting greatly increased business by your company, would have a very great effect upon your stock?

Mr. MARTIN. It does naturally have an effect in a business way upon the securities of a company of this kind, but I do not know to what extent it will affect the securities of our company.

Mr. WURZBACH. What property would your company acquire in fee if your order was accepted that would not include property in fee acquired by the Ford company if their offer was accepted?

Mr. MARTIN. We do not purchase or undertake to purchase nitrate plant No. 1. We do not undertake to purchase nitrate plant No. 2, with the exception of the steam plant at that location, nor the Waco quarry. So the Government is alone in its position as the owner of the two nitrate plants and the Waco quarry, except that we take the steam plant at No. 2. There is a marked difference between this proposition and the other proposition you are considering, as respects the No. 2 development. We propose to the Government to take the title by deed from the Government of the Wilson Dam property and go forward and complete it.

Mr. WURZBACH. I understand that.

Mr. MARTIN. The effect of that has a very important aspect locally, because it brings that property under local taxation laws, and, you see, the project will then bear its local burden of taxation, and at the same time the Government has its right of recapture of that project at the end of 50 years. As respects a lease, of course, if the Government would want to retain the title and lease the project and finance it, that has a very different aspect.

Mr. WURZBACH. With reference to the two nitrate plants, is it contemplated that Mr. Ford would get title in fee to the two nitrate plants; is that your understanding of the Ford offer?

Mr. WURZBACH. That is my understanding of the project, Mr. Wurzbach.

Mr. WURZBACH. In section 5 of your offer it is provided "The Government is to transfer to the licensee the Wilson Dam property represented by its investment and commitments to date, free of liabilities and unencumbered, including the construction plant." What do you understand as being included within the construction plant of the property?

Mr. MARTIN. Those derricks and tracks and dumping facilities and camps that are there now, to-day—whatever is there constituting a construction plant.

Mr. WURZBACH. That would not be included in the Ford title as passing title in fee to Mr. Ford.

Mr. MARTIN. I do not recall. However, it is included in the \$17,000,000 already invested in the dam.

Mr. WURZBACH. You are familiar enough with the Ford offer to know whether or not it is to be included, whether Mr. Ford would receive title to the construction plant under his offer, are you not?

Mr. MARTIN. I do not understand that he asks for title to any of that property, but I do not recall that matter.

Mr. WURZBACH. If Mr. Ford is not to receive that property and your company is to receive it, the value of that property would be the difference between your offer and Mr. Ford's offer, would it not?

Mr. MARTIN. It is all there available for use to whoever undertakes to complete this construction, whether our company or some one else will use that plant. At the end of its use it has a salvage value, but not much.

Mr. WURZBACH. Is it not a fact, Mr. Martin, that at the present time that property has a book value of \$4,740,807; that is, nearly \$5,000,000.

Mr. MARTIN. The construction plant?

Mr. WURZBACH. Yes.

Mr. MARTIN. I really do not know. We are treating the question on the basis of \$17,000,000.

Mr. WURZBACH. I have been informed by Army officers that that is the book value, and that the estimated value at the present time is about \$2,990,433. If that is true, and if it is also true that you are to receive this property under your offer and Mr. Ford is not to receive it under his offer, then there is that much difference in favor of the Ford offer over your offer.

Mr. MARTIN. No. Mr. Ford gets the nitrate plants and Waco quarry, in which the Government has an investment of \$87,000,000. Let us follow that a step further. In its present position, under the other offer to which you refer the licensee or the lessee will go forward with that construction. By the time he uses it in the Wilson Dam construction, and then moves it to Dam No. 3 and gets through with it there, it will be junk anyway, so it will all be used or consumed in that construction and at the end of six years it is not worth anything. I think you will find that to be the situation upon investigation. There is a great deal of that construction plant. There is a temporary concrete highway constructed entirely across this river. It represents many thousands of dollars. It is worth nothing except for that immediate use. You will find a great deal of this construction plant has no recoverable value.

Mr. WURZBACH. I understand that amount of \$4,740,807 is made up of the following items: Material and supplies, \$500,480; plant and equipment, \$2,331,007; main-line railroad and equipment, \$801,110; camps, housing, etc., \$1,108,120. The plant and equipment is worth about the book value, is it not, or very near the book value?

Mr. MARTIN. I can not say that any camp or equipment purchased during the war period is worth its book value now.

Mr. WURZBACH. Under the Ford offer at this time the Government would have the right to sell this property.

Mr. MARTIN. Of course.

Mr. WURZBACH. And salvage this property without in any way affecting the offer of Mr. Ford.

Mr. MARTIN. I do not know; I can not answer that question. I would have to reserve the right to answer it at another time.

The CHAIRMAN. We are very much obliged to you Mr. Martin. You have been very patient. We will now call upon the military officer whose evidence Mr. Dent desires to introduce.

**STATEMENT OF MAJ. JOHN G. BOOTON, ORDNANCE DEPARTMENT,
IN CHARGE OF CONTRACT SECTION, ORDNANCE DEPARTMENT,
AND CUSTODIAN OF THE RECORDS OF THE CONTRACT SECTION.**

The CHAIRMAN. Will you state to the reporter your name in full, your rank, and also the position you occupy in the War Department?

Maj. Booton. Maj. John G. Booton; Ordnance Department; in charge of the contract section of the Ordnance Department and custodian of the records of the contract section.

The CHAIRMAN. How long have you been in the War Department?

Maj. BOOTON. As an officer of the War Department?

The CHAIRMAN. Yes.

Maj. BOOTON. Since 1911.

The CHAIRMAN. Were you a private before you became an officer?

Maj. BOOTON. I was a graduate of the United States Military Academy, entering in 1906.

The CHAIRMAN. Mr. Dent wants to ask you a few questions, and he will kindly propound them now.

Mr. DENT. Major, you say you are the keeper of the records, contracts, orders, and regulations by the Secretary of War in the Ordnance Department?

Maj. BOOTON. Yes, sir.

Mr. DENT. Has your attention been called to the contract relative to the Gorgas plant between the Government and the Alabama Power Co.?

Maj. BOOTON. Yes, sir; within the past three or four days.

Mr. DENT. Are you familiar with the act of July 9, 1918, authorizing the sale of war materials, supplies, and so forth?

Maj. BOOTON. Yes, sir.

Mr. DENT. Did the Secretary of War make any order or regulation relative to that act; and, if so, when, and will you please produce it?

Maj. BOOTON. The Secretary of War on August 31, 1918, issued Bulletin No. 50, headed "War Department, Washington, August 31, 1918," article 5 of which quotes an extract of the act of Congress on the sale of war supplies; that is, the act approved July 9, 1918, and further provides that—

"2. (a) Bureaus of the War Department desiring to sell supplies embraced within the provisions of this act, the cost price of which is in excess of \$5,000, shall secure the approval of the Director of Purchase, Storage and Traffic Division, General Staff, except in the Philippine and Hawaiian Departments, where the authority of the department commanders is sufficient.

"(b) Upon receipt of such approval from the Director of Purchase, Storage and Traffic, such supplies which are intended for sale to persons, partnerships, associations, and corporations will then be disposed of unless otherwise directed by the Director of Purchase, Storage and Traffic, for cash at auction, or to the highest bidder on sealed proposals, on due public notice, and, in such market as the public interests may require. The officer making the sale will suspend it when in his opinion better prices can be obtained. The auctioneer's certified detailed account of the sale, and the vouchers for the expenses attending it, will be reported on the proper forms to the chief of the bureau to which the property pertained. Such supplies as are intended for sale to any other department of the Government or to any foreign State or Government engaged in

war against any Government with which the United States is at war shall be at not less than the invoice price, including cost of inspection and transportation.

"(c) The proceeds of sales shall be deposited to the credit of that appropriation out of which was paid the cost to the Government of the property thus sold, and the same shall immediately become available for the purposes named in the original appropriation."

Mr. DENT. Was any order made relative to contracts of this character by the Purchase, Storage and Traffic Division of the General Staff?

Maj. BOOTON. There was Supply Bulletin No. 13, headed "War Department, Purchase, Storage and Traffic Division, General Staff, Purchase and Supply Branch, Washington, August 3, 1918," reading as follows:

"Subject: Contract provisions regarding increased manufacturing facilities.

"1. Where increased manufacturing facilities are constructed at the expense of the Government or where their cost is amortized in the price paid by the Government, the contract shall provide that title to such facilities shall vest in the United States. The contractor may agree to take such facilities at a fair value in diminution of the profit which he otherwise would make.

"2. Where title to increased manufacturing facilities vests in the United States, the contract shall provide that the contractor may make written offer in the Government to purchase such facilities, whereupon, if the Government accepts such offer, the contractor shall become obligated to pay for such facilities at their appraised value at that time. The contract shall further provide that if the contractor does not make or the Government does not accept such offer, the Government shall have the right to remove such facilities after the termination of the contract within a time reasonably sufficient to effect such removal.

The contract may provide that the Government shall have an option at the termination of the contract to purchase at an appraised value the land on which such facilities are erected.

"3. If, in any case of such increased manufacturing facilities, it is desired to make a contract along lines different from those herein established, the approval of the superior board of review shall first be secured."

That was signed by authority of the Secretary of War by George W. Goethals, major general, Assistant Chief of Staff, Director of Purchase, Storage and Traffic. The last paragraph refers to the superior board of contract review in the General Staff.

Mr. DENT. Have you any record of the action of the Chief of Ordnance in appointing contract officers to execute contracts for the department, and any records relative to this particular contract?

Maj. BOOTON. I have an office order, No. 157, of 1918, which appoints, among others, William Williams, lieutenant colonel, Ordnance Department, National Army, as a contracting officer.

Mr. DENT. What was the date of that?

Maj. BOOTON. This is order No. 157. No. 156 is dated February 26, 1918, and No. 158 is dated March 5, 1918, and in looking up some other records I find March 2 given as the date of the appointment of Lieut. Col. Williams.

Mr. DENT. Who signed this contract?

Maj. BOOTON. Who signed this contract, and whose name appears on this order. This office order for some reason is not dated.

Mr. DENT. Have you a record showing that the board of review approved this contract?

Maj. BOOTON. The office order 157, to which I just referred, reads as follows:

WAR DEPARTMENT,
OFFICE OF THE CHIEF OF ORDNANCE,
Washington, March 3, 1918.

Office order No. 157 (authority to execute contracts).

1. Office order No. 145, relating to officers authorized to execute contracts, is hereby rescinded, and the following substituted therefor:

"1. Contracts with private manufacturers to meet the schedules of requirements for ordnance and ordnance stores and supplies will be executed only by the procurement divisions of the Ordnance Office. The following officers, but no others, are hereby authorized to execute such contracts: Samuel McRoberts, colonel, Ordnance, N. A.; Charles N. Black, lieutenant colonel, Ordnance, N. A.; R. P. Lamont, lieutenant colonel, Ordnance, N. A.; William Williams, lieutenant colonel, Ordnance, N. A.; C. F. Cook, major, Ordnance, N. A.

"2. Paragraph A of section 6 of officer order No. 104 is hereby amended to the extent necessary to give effect to the foregoing."

C. B. WHEELER,
Brigadier General, Ordnance, N. A.,
Acting Chief of Ordnance.

Official:

W. S. PEIRCE,
Brigadier General, Ordnance, N. A.

Copies sent to: Chiefs of bureaus and divisions, heads of sections, and arsenals.

I find by examination of the records that William Williams, lieutenant colonel, Ordnance Department, National Army, was contracting officer until February 4, 1919, continuing from March 2, 1918.

Mr. DENT. I asked you about the board of review approving this contract.

Maj. BOOTON. There is attached to the retained copy of the contract in the nitrate division an approval carrying the signature of the officers approving the contract, and the statement "approved by Board of Contract Review of Procurement Division, November 8. W. Arthur Babson, secretary." That board was an ordnance function, a committee appointed by the order of the Purchase, Storage and Traffic Division of the General Staff.

Mr. McKENZIE. Are the names of the officers attached there?

Maj. BOOTON. Yes, sir.

Mr. McKENZIE. Will you please read those names?

Maj. BOOTON. They are J. W. Joyes, colonel, Ordnance, United States Army; C. F. Beames, major, Ordnance Department, United States Army; E. V. Pren-

tiss, major, Ordnance Department, United States Army; G. M. Alexander, captain, Ordnance Department, United States Army; Dale Bumstead, lieutenant, Ordnance Department, United States Army. Then there is typed an officer's signature, R. H. Swartwout, which is initialed "R. H. S."

Mr. DENT. What is this memorandum here [handing paper to witness.]

Maj. BOOTON. I do not know the significance of that.

Mr. DENT. You had better put that in the record.

Maj. BOOTON. On the side is written in handwriting "I concur in the approval of this contract. A. W. Burchard."

Mr. McKENZIE. Col. Joyes was chairman of the board of review, I take it.

Maj. BOOTON. He was the senior officer; there were six initiators, each of whom was responsible for his separate detail. Col. Joyes was senior and in charge of the nitrate division, so he was the one most interested.

Mr. McKENZIE. Have you found anything in your records down there in looking this thing up to indicate that the Secretary of War gave any directions in connection with this matter.

Maj. BOOTON. No, sir; nothing at all.

Mr. McKENZIE. You have not found anything in the records at all to indicate the approval of the Secretary of War.

Maj. BOOTON. Except the approval by authorized agencies of his.

Mr. McKENZIE. Those agencies were all subordinate officers to the Chief of Ordnance.

Maj. BOOTON. No, sir; there is also the approval of the clearance committee of the Purchase, Storage and Traffic Division of the General Staff.

Mr. McKENZIE. He was a subordinate officer.

Maj. BOOTON. To the Secretary of War.

Mr. McKENZIE. And also to the chief of the Purchase, Storage and Traffic Division.

Maj. BOOTON. Yes, sir; the chief of the Purchase, Storage and Traffic Division was at that time in charge of all activities of the staff purchasing departments.

Mr. McKENZIE. Was that Gen. Goethals?

Maj. BOOTON. That was Gen. Goethals; yes, sir.

Mr. McKENZIE. Does his name appear in any way connected with this matter.

Maj. BOOTON. No, sir; the approval was made by a committee of the Purchase, Storage and Traffic Division, acting I suppose in his name. The only thing I was able to find was a certificate in handwriting by Maj. Beames that this project was approved under clearance No. 1285 on November 9, 1918.

Mr. McKENZIE. Then the officer of the highest authority connected with this whole proceeding was the Chief of Ordnance, Gen. Williams.

Maj. BOOTON. His name does not appear directly as an initiator or as signing the contract.

Mr. McKENZIE. He delegated to the various officers the authority to act in the capacities in which they did act.

Maj. BOOTON. Yes, sir.

Mr. McKENZIE. You have not anything beyond the Chief of Ordnance that would indicate that the Secretary of War had anything to do with it.

Maj. BOOTON. He delegated his authority to the Purchase, Storage and Traffic Division to approve forms and individual contracts, which is the reason for the approval by the clearance committee, and the Chief of Ordnance gets his general authority directly from the acts of Congress. In the Revised Statutes, section 1164, it is prescribed "It shall be the duty of the Chief of Ordnance, under the direction of the Secretary of War, to make contracts of purchase for procuring necessary supplies and ordnance stores for use of the armies of the United States."

Mr. McKENZIE. That is true; but there is not anything whatever before the committee up to date that indicates that the Secretary of War had anything to do with either directing or procuring or preparing this contract.

Mr. DENT. Mr. Chairman, if I may interpose at this point the first document we offered was a general order issued by the Secretary of War authorizing contracts in the various departments to be made in this way. There was no specific authority for this particular contract, but general authority for contracts of this nature. That is the first document we put in the record this afternoon.

Mr. WURZBACH. That was with regard to the sale of supplies.

Mr. DENT. In connection with the act of July 9.

Mr. MILLER. Major, did I understand you correctly when you said this contract with the Alabama Power Co. was approved by the board of review on November 8, 1918?

Maj. BOOTON. That is what is set down here.

Mr. MILLER. The contract was not signed until the 9th; how do you figure that out?

Maj. BOOTON. It was approved prior to the signing. The approval was supposed to be before the signatures. Sometimes it was before the contracts were sent out and before the contractor was allowed to sign or before the Government released it.

Mr. MILLER. Then the board of review simply approved the phraseology of the contract?

Maj. BOOTON. Approved the phraseology in general. That was a legal board of review. The practical board of review were the negotiators, and the negotiators looked out for the business end of the contract. The board of review looked after the legal rights.

Mr. MILLER. Was that customary?

Maj. BOOTON. It was customary during the war.

Mr. QUIN. Have you the original drafts along with this contract?

Maj. BOOTON. This is the original signed copy; yes, sir.

Mr. QUIN. Are you the keeper of the records? Have you the correspondence between the parties at interest?

Maj. BOOTON. I have not got it here; but I can get it.

Mr. QUIN. Who is the keeper of that?

Maj. BOOTON. It is either in the general records or in the contract records.

Mr. QUIN. What officer would be the proper officer for us to call?

Maj. BOOTON. I can get it for you, and, usually, I would be the one to get it eventually.

Mr. QUIN. Please let me see the original draft.

Maj. BOOTON. Those are the signatures.

Mr. QUIN. Is that the same one that is printed?

Maj. BOOTON. So far as I know it is is. That is one of the office copies. Then, there is a lot of miscellaneous data attached, interoffice letters and instructions, etc.

Mr. QUIN. The evidence shows that there was correspondence and then memoranda, which we have not seen. Is that in here?

Maj. BOOTON. No, sir; it is not in there. This is more or less the final draft, rather than the preliminary negotiations. If you want those we can get them for you.

Mr. QUIN. Mr. Chairman, this gentleman is not the direct keeper of those things, but he says he can produce them—all of the documents and communications and memoranda in regard to this contract the 1st of December, 1917—from the beginning up to ultimate signing of it. Should we not call some other officer and get this information?

Mr. McKENZIE. I suppose, if the members of the committee would like to have those matters presented, it might be well to have them brought up here.

Mr. DENT. Most of it has been put in the record already by Mr. Martin.

Mr. McKENZIE. Major, we are very much obliged to you for coming up here and giving us the information you have put in the record.

(Thereupon the committee, at 4.45 o'clock p. m., adjourned until to-morrow, Friday, March 3, 1922, at 10.30 o'clock a. m.)

LIST OF MEMBERS OF NATIONAL FERTILIZER ASSOCIATION.

10. *Construction.*—Lessee agrees to begin construction within 60 days from the time it is given possession of the property and to continue such construction in a diligent, business, and workmanlike manner until all construction work provided for under this contract shall be completed, according to terms herein-after set forth, within three years from the time of possession, reasonable extension of time to be granted for delays over which the lessee has no control.

11. *Changes.*—It is further agreed that at any time during the construction, if, in the opinion of either party herein, the structures provided for in the plans have become, or are liable to become, weak, dangerous, uncertain, or inefficient they may request changes, extensions, or additions to be made in the plans for the purpose of increasing the strength, stability, duty, endurance, or efficiency of the dams, locks, power stations, or other structures to be built by lessee under provisions of this contract, such changes, extensions, or additions shall be submitted to the engineer representing the other party and to the surety company furnishing the bond of the lessee, and if such changes, extensions, or additions shall be approved by the engineer representing the other party and the surety company they are to become a part of this contract and become as binding on both parties, and the bonds of the lessee, as if originally written herein.

12. *Arbitration.*—It is also provided that, in event a request of either party for changes, extensions, or additions in the plans for any of the purposes set forth in the foregoing paragraph of this contract has been approved by the surety on the bond of the lessee, and has not been approved by the engineer representing the other party, then the questions of endurance or strength or such material or members as can be determined by physical test shall be submitted to the United States Bureau of Standards for final determination, and all questions as to the effect of the proposed changes, extensions, or additions upon the increase of strength, stability, duty, endurance, or efficiency of the dams, locks, power stations, or other structures to be built under this agreement, the plans for the changes as requested shall be submitted to the engineering faculty, or such members thereof who will undertake the work, of one or both of the following-named universities or schools of technology: Massachusetts Institute of Technology, Cambridge, Mass.; Cornell University, Ithaca, N. Y.; and the report of such faculty or faculties, if submitted to more than one, together with the report of the Bureau of Standards, shall be final; and if such report of the Bureau of Standards and faculties of technical schools mentioned herein show that the proposed changes, extensions, or additions will materially increase the strength, stability, duty, endurance, or efficiency of the structures affected by the changes, extensions, or additions, then such changes, extensions, or additions shall become a part of the working plans of this contract, the same as if they were originally written herein or had been approved by the engineers of both parties and the surety bond.

13. *Costs of tests.*—It is also understood and agreed that the cost of testing, consulting, or other expenses caused by the request for changes in the plans as provided for shall be a part of the construction cost provided herein.

14. *Representatives.*—It is understood and agreed that during the time of construction that both parties hereto shall designate an engineer to represent them on the work, and the acts of such engineer shall be binding as to the party designating him as a representative.

15. *Investment.*—It is agreed that the lessee will not be required to invest in the manufacture of nitrates or other fertilizer compounds any money other than that received from the sale of the products of the nitrate plants, plus 1 mill per kilowatt-hour received from the sale of power in excess of that required to operate the plant.

16. *Sale of products.*—It is further agreed that the lessee will sell all fertilizer and fertilizer compounds produced by the plant at prices and on conditions and terms approved by the Secretary of Agriculture.

17. *Additional plants.*—It is further agreed that in event the development of power for use and sale from this plant, together with the receipts from the sale of products, should be insufficient to produce the amount of fertilizer compounds required to supply the demands, the lessee agrees to construct, under the terms of this agreement, other power plants or storage reservoirs, upon sites owned by the Government and selected by the Secretary of War and itself, said plants or storage reservoirs to be constructed and operated under the general terms of this agreement for the purpose of enabling it to provide the fertilizer compounds to meet growing needs.

18. *Profits from nitrates.*—It is also further agreed that when nitrates can be made at a profit or when the cost of the same has been so reduced that the funds arising from the sale of excess power and fertilizer compounds are not

needed in whole or in part for financing such productions as herein provided, the said funds shall be paid by the lessee into the Treasury of the United States.

19. *Consideration.*—In consideration of the performance of the foregoing proposals and conditions the Government shall agree to pay to the lessee the cost plus 5 per cent of the completion of Dam No. 2, the initial alterations of nitrate plants No. 1 and No. 2, and the completion of the locks at Dam No. 2, and when required by the Government to build Dam No. 3 and the locks at Dam No. 3 and additional plants and storage reservoirs, on the same terms, in monthly payments, as per estimates of the engineers upon schedules of work performed.

20. *Payments.*—It is agreed herein that the engineer representing the Government will on the first of each month give the lessee an estimate of the work performed and a statement of the amount earned by it during the preceding month.

21. *Stores, stock, and equipment.*—All stores, supplies, equipment, including engineers' supplies, files and instruments, and other loose personal property now on or about the premises, whether or not required for construction purposes, but not including subsistence stores, shall become the property of the lessee upon the execution of this contract.

22. *Compensation.*—It is further agreed that as a part of the compensation for the performance of this contract the lessee will retain the proceeds from the sale of power not required to operate the plant or plants, and locks or lifts, over and above the 1 mill per kilowatt-hour required for financing the production of fertilizer compounds, or to be paid into the United States Treasury as set forth in this agreement.

23. *Power for locks.*—The lessee agrees to furnish to the Government, free of charge, all power required to operate the locks or lifts which are to be operated by the Government.

24. *Emergency provision.*—The lessee agrees to place the property or any part thereof at the disposal of the Government in the event of war or any other public emergency, or to operate the same for the Government to manufacture nitrates, explosives, or munitions of war or for other purposes necessary for the safety of the United States, as the Government may require.

25. *Bond.*—The lessee agrees to protect the Government for the full and faithful performances of the contract by giving a good and sufficient surety bond, to be approved by the Government.

26. *Inspection.*—It is agreed that the Government experts, inspectors, and accountants can, at all reasonable times, examine the books, papers, accounts, meters, and such other accessories of the plant necessary to satisfy them whether or not the lessee is executing this contract in good faith.

27. *Repairs.*—It is also agreed that should the foundation of Dam No. 2 be found defective or show excessive leakage, the Government will pay to the lessee the expense of the necessary repairs, including a reasonable allowance for overhead.

In witness whereof, the United States of America has caused these presents to be executed by the Secretary of War, pursuant to the authority conferred upon him by act of Congress, approved the — day of —, 1922, entitled "An act to provide for the lease and completion of Muscle Shoals, and other purposes," and the said Frederick E. Engstrum has set his hand on the day and year first herein above set forth.

UNITED STATES OF AMERICA.

By ———, Secretary of War.
FREDERICK E. ENGSTRUM.

The CHAIRMAN. I understand that Senator Butler is here for Mr. Engstrum, and the committee would be very glad to hear any statement that he desires to make regarding this matter.

Mr. BUTLER. Mr. Chairman, Mr. Engstrum is present and I would like for him to appear and make a brief statement before I begin.

The CHAIRMAN. That is perfectly agreeable. I thought, as attorney, you would desire to be heard first.

STATEMENT OF MR. FREDERICK E. ENGSTRUM, WASHINGTON, D. C.

The CHAIRMAN. Mr. Engstrum, the committee will be glad to hear from you what you desire to say regarding the matter of your office. Will you kindly state for the record your name in full, your present address, and occupation?

10. *Construction.*—Lessee agrees to begin construction within 60 days from the time it is given possession of the property and to continue such construction in a diligent, business, and workmanlike manner until all construction work provided for under this contract shall be completed, according to terms herein-after set forth, within three years from the time of possession, reasonable extension of time to be granted for delays over which the lessee has no control.

11. *Changes.*—It is further agreed that at any time during the construction, if, in the opinion of either party herein, the structures provided for in the plans have become, or are liable to become, weak, dangerous, uncertain, or inefficient they may request changes, extensions, or additions to be made in the plans for the purpose of increasing the strength, stability, duty, endurance, or efficiency of the dams, locks, power stations, or other structures to be built by lessee under provisions of this contract, such changes, extensions, or additions shall be submitted to the engineer representing the other party and to the surety company furnishing the bond of the lessee, and if such changes, extensions, or additions shall be approved by the engineer representing the other party and the surety company they are to become a part of this contract and become as binding on both parties, and the bonds of the lessee, as if originally written herein.

12. *Arbitration.*—It is also provided that, in event a request of either party for changes, extensions, or additions in the plans for any of the purposes set forth in the foregoing paragraph of this contract has been approved by the surety on the bond of the lessee, and has not been approved by the engineer representing the other party, then the questions of endurance or strength or such material or members as can be determined by physical test shall be submitted to the United States Bureau of Standards for final determination, and all questions as to the effect of the proposed changes, extensions, or additions upon the increase of strength, stability, duty, endurance, or efficiency of the dams, locks, power stations, or other structures to be built under this agreement, the plans for the changes as requested shall be submitted to the engineering faculty, or such members thereof who will undertake the work, of one or both of the following-named universities or schools of technology: Massachusetts Institute of Technology, Cambridge, Mass.; Cornell University, Ithaca, N. Y.; and the report of such faculty or faculties, if submitted to more than one, together with the report of the Bureau of Standards, shall be final; and if such report of the Bureau of Standards and faculties of technical schools mentioned herein show that the proposed changes, extensions, or additions will materially increase the strength, stability, duty, endurance, or efficiency of the structures affected by the changes, extensions, or additions, then such changes, extensions, or additions shall become a part of the working plans of this contract, the same as if they were originally written herein or had been approved by the engineers of both parties and the surety bond.

13. *Costs of tests.*—It is also understood and agreed that the cost of testing, consulting, or other expenses caused by the request for changes in the plans as provided for shall be a part of the construction cost provided herein.

14. *Representatives.*—It is understood and agreed that during the time of construction that both parties hereto shall designate an engineer to represent them on the work, and the acts of such engineer shall be binding as to the party designating him as a representative.

15. *Investment.*—It is agreed that the lessee will not be required to invest in the manufacture of nitrates or other fertilizer compounds any money other than that received from the sale of the products of the nitrate plants, plus 1 mill per kilowatt-hour received from the sale of power in excess of that required to operate the plant.

16. *Sale of products.*—It is further agreed that the lessee will sell all fertilizer and fertilizer compounds produced by the plant at prices and on conditions and terms approved by the Secretary of Agriculture.

17. *Additional plants.*—It is further agreed that in event the development of power for use and sale from this plant, together with the receipts from the sale of products, should be insufficient to produce the amount of fertilizer compounds required to supply the demands, the lessee agrees to construct, under the terms of this agreement, other power plants or storage reservoirs, upon sites owned by the Government and selected by the Secretary of War and itself, said plants or storage reservoirs to be constructed and operated under the general terms of this agreement for the purpose of enabling it to provide the fertilizer compounds to meet growing needs.

18. *Profits from nitrates.*—It is also further agreed that when nitrates can be made at a profit or when the cost of the same has been so reduced that the funds arising from the sale of excess power and fertilizer compounds are not

needed in whole or in part for financing such productions as herein provided, the said funds shall be paid by the lessee into the Treasury of the United States.

19. *Consideration.*—In consideration of the performance of the foregoing proposals and conditions the Government shall agree to pay to the lessee the cost plus 5 per cent of the completion of Dam No. 2, the initial alterations of nitrate plants No. 1 and No. 2, and the completion of the locks at Dam No. 2, and when required by the Government to build Dam No. 3 and the locks at Dam No. 3 and additional plants and storage reservoirs, on the same terms, in monthly payments, as per estimates of the engineers upon schedules of work performed.

20. *Payments.*—It is agreed herein that the engineer representing the Government will on the first of each month give the lessee an estimate of the work performed and a statement of the amount earned by it during the preceding month.

21. *Stores, stock, and equipment.*—All stores, supplies, equipment, including engineers' supplies, files and instruments, and other loose personal property now on or about the premises, whether or not required for construction purposes, but not including subsistence stores, shall become the property of the lessee upon the execution of this contract.

22. *Compensation.*—It is further agreed that as a part of the compensation for the performance of this contract the lessee will retain the proceeds from the sale of power not required to operate the plant or plants, and locks or lifts, over and above the 1 mill per kilowatt-hour required for financing the production of fertilizer compounds, or to be paid into the United States Treasury as set forth in this agreement.

23. *Power for locks.*—The lessee agrees to furnish to the Government, free of charge, all power required to operate the locks or lifts which are to be operated by the Government.

24. *Emergency provision.*—The lessee agrees to place the property or any part thereof at the disposal of the Government in the event of war or any other public emergency, or to operate the same for the Government to manufacture nitrates, explosives, or munitions of war or for other purposes necessary for the safety of the United States, as the Government may require.

25. *Bond.*—The lessee agrees to protect the Government for the full and faithful performances of the contract by giving a good and sufficient surety bond, to be approved by the Government.

26. *Inspection.*—It is agreed that the Government experts, inspectors, and accountants can, at all reasonable times, examine the books, papers, accounts, meters, and such other accessories of the plant necessary to satisfy them whether or not the lessee is executing this contract in good faith.

27. *Repairs.*—It is also agreed that should the foundation of Dam No. 2 be found defective or show excessive leakage, the Government will pay to the lessee the expense of the necessary repairs, including a reasonable allowance for overhead.

In witness whereof, the United States of America has caused these presents to be executed by the Secretary of War, pursuant to the authority conferred upon him by act of Congress, approved the — day of —, 1922, entitled "An act to provide for the lease and completion of Muscle Shoals, and other purposes," and the said Frederick E. Engstrum has set his hand on the day and year first herein above set forth.

UNITED STATES OF AMERICA.

21. *Stores, stock, and equipment.*—All stores, supplies, equipment, including engineers' supplies, files and instruments, and other loose personal property now on or about the premises, whether or not required for construction purposes, but not including subsistence stores, shall become the property of the lessee upon the execution of this contract.

22. *Compensation.*—It is further agreed that as a part of the compensation for the performance of this contract the lessee will retain the proceeds from the sale of power not required to operate the plant or plants, and locks or lifts, over and above the 1 mill per kilowatt-hour required for financing the production of fertilizer compounds, or to be paid into the United States Treasury as set forth in this agreement.

23. *Power for locks.*—The lessee agrees to furnish to the Government, free of charge, all power required to operate the locks or lifts which are to be operated by the Government.

24. *Emergency provision.*—The lessee agrees to place the property or any part thereof at the disposal of the Government in the event of war or any other public emergency, or to operate the same for the Government to manufacture nitrates, explosives, or munitions of war or for other purposes necessary for the safety of the United States, as the Government may require.

25. *Bond.*—The lessee agrees to protect the Government for the full and faithful performances of the contract by giving a good and sufficient surety bond, to be approved by the Government.

26. *Inspection.*—It is agreed that the Government experts, inspectors, and accountants can, at all reasonable times, examine the books, papers, accounts, meters, and such other accessories of the plant necessary to satisfy them whether or not the lessee is executing this contract in good faith.

27. *Repairs.*—It is also agreed that should the foundation of Dam No. 2 be found defective or show excessive leakage, the Government will pay to the lessee the expense of the necessary repairs, including a reasonable allowance for overhead.

In witness whereof, the United States of America has caused these presents to be executed by the Secretary of War, pursuant to the authority conferred upon him by act of Congress, approved the — day of —, 1922, entitled "An act to provide for the lease and completion of Muscle Shoals, and other purposes," and the said Frederick E. Engstrum has set his hand on the day and year first herein above set forth.

UNITED STATES OF AMERICA.
By _____, Secretary of War.
FREDERICK E. ENGSTRUM.

THE CHAIRMAN. I understand that Senator Butler is here for Mr. Engstrum, and the committee would be very glad to hear any statement that he desires to make regarding this matter.

MR. BUTLER. Mr. Chairman, Mr. Engstrum is present and I would like for him to appear and make a brief statement before I begin.

THE CHAIRMAN. That is perfectly agreeable. I thought, as attorney, you would desire to be heard first.

STATEMENT OF MR. FREDERICK E. ENGSTRUM, WASHINGTON, D. C.

THE CHAIRMAN. Mr. Engstrum, the committee will be glad to hear from you what you desire to say regarding the matter of your office. Will you kindly state for the record your name in full, your present address, and occupation?

Mr. ENGSTRUM. Mr. Chairman and members of the committee, to many of you I am a stranger. I am president of the Newport Shipbuilding Corporation. My name is Frederick E. Engstrum. I have been engaged in construction work for the last 25 years following my engineering course at the University of California. I was brought up in California. I engaged with my father in the construction of the then largest beet-sugar factory in the world at Oxnard, and have been engaged in various construction of railroads, canals, concrete fire-proof hotels and theaters and office buildings. In 1908 I invented the system of pouring concrete by the gravity system, which is commonly called "shooting concrete," which you have an example of here, fully developed, in the concrete bridge on the Potomac, which is a model plant for the shooting of concrete. My shipbuilding company has just completed some 19 concrete ships for the War Department, used in the Quartermaster's Department—the smaller type, with Diesel engine installation, used on the rivers and harbors, and the oil tankers serving the fuel supply. I have a shipyard in Wilmington, N. C., with a residence there, and my office and business address in Washington is 632 Southern Building.

In offering my proposal for the lease and completion of Muscle Shoals, I have associated with me Senator Butler, whom I would like to present the offer, Mr. Chairman, and I will be very glad at that time to answer any questions or make any changes possible that the committee sees fit, or do whatever I can to meet the desires of the Government in respect to entering into a lease of this kind.

The CHAIRMAN. You want Senator Butler to explain the proposition more in detail?

Mr. ENGSTRUM. If you please, Mr. Chairman.

The CHAIRMAN. We will be very glad to hear from Senator Butler. Senator Butler was formerly a Member of the United States Senate and is well known by reputation, at least, to all of you.

**STATEMENT OF HON. MARION BUTLER, ATTORNEY FOR MR.
FREDERICK E. ENGSTRUM.**

Mr. BUTLER. Mr. Chairman and gentlemen of the committee: This great water power has been a matter of more than ordinary interest to every American citizen who has given any attention to the water powers of this country, their development and their possibilities—even before the passage of the national defense act of June 3, 1916. Indeed, the possibilities at Muscle Shoals had the serious attention of our Government long before that time; under congressional authority the War Department had made extended investigations and borings and official reports to Congress with a view to developing this power, without any regard to the immediate approach of war, for the general public welfare.

The question of producing cheap and sufficient nitrates, I think, was seriously considered at that time, before the shadow of war was upon us, because even then we knew that there was a serious scarcity of nitrates in the world, and especially in this country. The chemical world has been studying the question for years and progress had been made, even at that time, that led to the well-founded hope that there were great possibilities in the fixation of nitrogen from the air when we could develop cheap hydroelectric power.

When war came Congress at once decided to develop this great water power for the immediate needs for the production of nitrates for explosives, and that led to the passage of the national defense act, in which, right in the midst of war, Congress did not lose sight of the resultant peace advantages that would come from making nitrates for fertilizer when the war was over; while Muscle Shoals was not named in the act, yet everybody had it in mind, and it was selected by the President as the best location and the best power to develop to make nitrates needed for explosives in time of war, and for the further declared purpose of using this same development for making nitrates fit for fertilizers in time of peace.

Of course, at that time nitrates for explosives was the overshadowing idea; in the same way to-day, the making of nitrates for fertilizers is the overshadowing purpose for peace time, together with nitrogen preparedness for war for all time in the future.

Now, in the light of that declared purpose of the Government, and in the face of a great need for more nitrogen and cheaper fertilizers, this proposal has been prepared to meet that sentiment and that need. Of course, we prepared it from a purely business standpoint, but in making the proposition it has been

shaped to meet, as we understand it, the declared public purpose and public need; therefore, our proposition is to devote this entire development to the making of nitrates and to developing the art. The hearings before this committee show the interest of the country in the making of more nitrogen and cheaper fertilizers and the development of this art of taking and using this most valuable element from the air, which is unlimited in quantity, for both national defense and the general public welfare in peace. It is, indeed, a great governmental purpose, and the present depression in agriculture has accentuated it, if possible.

The need for fertilizer is keenly felt in every part of the country, probably more keenly to-day than ever before, not only because we are learning more the need and value of fertilizer but also because the parts of our country that had stored up fertilizer values in the soil that nature put there from the beginning are beginning to realize the need of fertilizer. The South has always needed it more than the West, but we are approaching the time, indeed it is here, when every part of this country, in the development of agriculture and its success in feeding and clothing the Nation, will depend upon an adequate supply of fertilizer, cheap enough to enable the farmers to produce cheaply and to enable the consumers to consume at prices that are not prohibitive. So when, we face the proposition of a cheap fertilizer we are facing a basic question that affects the prosperity of agriculture and the cost of living to the great consuming world.

It is wise for us as individuals and also as a Nation occasionally to stop and take our bearings, our prospective as to other individuals and as to the other nations of the world. This great country is behind in the vital matter of giving proper attention to the production of food and clothing. This great country is using less fertilizer material than the small country of Germany, which we could put in one corner of this country and forget it was there. We are starving our soil. We did it from necessity during the war, but we did it before the war and we are again doing it now. Germany used last year 500,000 tons of nitrates for fertilizer. This country, with its enormous acreage, needing such fertilizers more than Germany—hungry for it, calling for it, impotent without it, with over half of the labor and toil of our wealth producers thrown away without this fertilizer to give nature a chance to respond to human efforts—used last year less than 175,000 tons, and at least half of that we imported from Chile.

I submit, Mr. Chairman, that these figures, which are correct, are staggering, and we should not lose any time in correcting this most serious situation.

Now, what is the trouble? To begin with, we are not producing sufficient nitrogen in this country and therefore we are not in a position to furnish ourselves in time of war or in time of peace. Germany produced last year over 300,000 tons of nitrogen from the air by a process they have invented, called the Haber process. That is cheaper and more efficient than the cyanamid process, which she is using to only a limited extent. But Germany can not produce nitrogen from the air by either process as cheaply as we can, because she has no great water powers by which she can develop cheap hydroelectric power. But we have got it to burn and we are burning it—we are not using it.

Talk about conservation, we are the most prodigal sons in the world with water power, because the only way you can conserve water power is to use it. What has gone over the dam an hour ago never will go over it again; it is gone. The trouble is it did not go over a dam, it went down the run or over the rapids; the only way we can conserve it is to use it and use all of it every minute. But we are not conserving our water power and we are most prodigal sons in that respect. We have everything in this country to enable us to outstrip the rest of the world in furnishing ourselves with everything we need, but we are not using it.

Germany produced last year by the cyanamid process 100,000 tons of nitrogen, in addition to the 300,000 tons produced by the Haber process. They are using both processes, but they find the Haber process the most valuable, the cheapest and the most efficient, and they are bending all their energies to develop it still further, and to perfect it. That country does not waste anything, and so, in addition to using these two scientific methods for taking the nitrogen from the air, they have saved every ounce of ammonia or nitrogen from the coke ovens. They saved in that way 100,000 tons last year, and that is the way they got the 500,000 tons—300,000 tons from the air by the Haber process, 100,000 tons from the air by the cyanamid process, and 100,000 tons from the coke ovens.

Now, to-day, gentlemen, we are not producing commercially one pound of nitrogen from the air by either process. We are dependent on what we save from the coke ovens. Every fertilizer factory in this country has to look to coke ovens for the by-product they can get there, and then they have to go to Chile or to some other country which is manufacturing it, in order to get the rest of the nitrates that they use for fertilizer. The result is that it is so dear the fertilizer companies do not use as much nitrogen in fertilizer as they should, and the farmers do not buy half the fertilizer that they know they need.

Now, that brings us, Mr. Chairman, concretely to why Mr. Engstrom's proposal provides for not scrapping Nitrate Plant No. 1 at Muscle Shoals, which is the Haber process. I believe no other offer you have before you proposes to utilize Nitrate Plant No. 1.

The CHAIRMAN. Not for manufacturing nitrates.

Mr. BUTLER. But to scrap it as a nitrate plant and to use it for general manufacturing purposes, for making automobile parts or dolls or something else, but not for making nitrates. We propose to use both nitrate plants for making nitrates.

Now, Mr. Chairman and gentlemen of the committee, if you will pardon me for a moment, I want to say that I am interested in this question more than as counsel. I was born and raised on a farm and have been largely interested in agriculture as a business all my life; I own and am operating one of the largest farms in my State, and therefore I know the situation intimately as a practical farmer. I am a little more than an agriculturist; I am a real farmer. I spend much time on that plantation in person. During the war I devoted my whole time to it; when my boys went to the front to shoot bullets I went down to the farm to make biscuits, and I stayed personally during the war. With my plantation stripped of its best labor I tried to supply its place with farm machinery, but the most serious problem was fertilizers.

This fertilizer proposition I have faced and studied from every angle, and it is the worst handicap I have had to face as a wealth producer; that is, to find a way to buy enough fertilizer to make my machinery and my labor and my land and my own efforts produce the results that should have been produced. I have found it impossible for me to produce what that effort and labor and expense should have produced and would have produced in any other business.

I have mixed my own fertilizers; I was forced to do it; and every farmer should do it until he can buy them compounded cheaper, because we pay too much for the mixing. So I have dealt with the fertilizer ingredients and have searched the world to try to get them cheap and then mix them myself; I mix different combinations to suit each field and each crop, not only from an analysis of the soil but also from experience, which has proved to be a better guide than soil analysis. Therefore, gentlemen of the committee, this question, that you are considering, would appeal to me just as strongly if I were not counsel in this case, but simply as a citizen; and I trust you will pardon me for thus qualifying myself from experience to testify in this matter as an expert.

I have watched and followed the proposed development of Muscle Shoals from the very beginning; I have read and kept up with every report and everything you have done, never with any idea at that time of appearing here as counsel about it, but as an American citizen deeply interested in the production of a sufficient supply of nitrogen to meet the serious question of nitrogen preparedness for both war and peace. I am as much delighted to-day, as any American citizen can be, at this interest your committee is now showing in this matter. No one was more disappointed than myself when Congress failed to make the appropriation after the war to continue the development of this project. It now looks as if we were going to do it and it is a glad message of cheer to all of the American people, not only to the farmers but to all of the consumers, for it means much to them.

Now, Nitrate Plant No. 1 is the only plant in this country, outside of the one small plant that has been built at Syracuse since the war, that is built to use the Haber process; and, to me, it is a shocking proposition to abandon the use and development of that process at Muscle Shoals, and to go back to simply running the cyanamid plant there, which is more expensive and which has not the same future possibilities of development. It is not possible to meet our needs for nitrogen by the cyanamid process alone, and when I say that I think I am speaking from the composite wisdom of the scientists and the experts who have studied the question of the fixation of nitrogen

from the air, because that process is more expensive and has not the possibilities in it for development that the Haber process has. They all expect the progress to be made in improving the methods for the fixation of atmospheric nitrogen to be along the lines of the Haber process; and, if that is true, then we should not scrap Nitrate Plant No. 1, which is the Haber process.

It is true that during war times and without full knowledge of what the Haber process was we did not make a success of Nitrate Plant No. 1. I do not criticize anybody. I think it was done the best that could have been done at the time—with the information we had—but we know to-day that we can redesign that plant and run it perfectly by the Haber process. The one serious defect in that plant is the need of an efficient catalyst, which is essential in forcing the nitrogen and the hydrogen to join to make ammonia. The Germans keep the composition of their catalyst a secret, but we have succeeded since the war in making a catalyst which is better than the one used by the Germans. Therefore, we can to-day make Nitrate Plant No. 1 a better plant than anyone in Germany—as far as we know; and we can do it at a cost that will be so good an investment that we can not afford to fail to do it. The highest estimate, I think, which General Williams, Chief of the Ordnance Department, gave was \$4,000,000 to make Nitrate Plant No. 1 a successful plant by the Haber process. An investment of \$4,000,000, therefore, will make that plant a successful going concern. We should not scrap what is there, but we should use it—when we scrap things we are throwing them away.

Under the Engstrom proposal you will conserve the value of that plant by redesigning it so as to do economically what we know can be done with it. This plant has already cost \$13,000,000, and there is no other way that Congress can spend \$4,000,000 to develop this art that will be worth as much to the country, both in times of peace and in times of war, as by redesigning that plant and making it a going concern.

I appeal to you as a citizen, rather as an attorney, not to scrap that plant, but to redesign it and put it to work making nitrogen. The War Department and the Agricultural Department know how to do it. General Williams and Major Burns, who is the nitrate expert of the War Department, told you on the stand that they had already worked out plans and they knew exactly how to do it. Doctor Tolman, the nitrate expert of the Agricultural Department, told you that we know now how to make nitrate plant No. 1 the best and most efficient Haber process plant in the world. Therefore, by spending \$4,000,000 more on that plant we have a plant, which will be taking more nitrogen from the air at less cost than any other plant in existence.

Now, if this water power is going to be used for the great purposes declared in the national defense act, then we should not scrap anything we have there, but we should run both nitrate plants and, as we develop the power further, we should build more nitrate plants. That is exactly the vision that we had, Mr. Chairman, when we prepared this proposal.

Mr. Engstrom's proposal does not require the building of Dam No. 3 at this time, but it does provide for doing it later. We all know that a succession of dams and reservoirs can and will be built up that river. There is no public need for Dam No. 3 at the present time, but under our proposal we stand in readiness any minute that the Government decides, as a matter of policy to proceed with it, to build it under our contract. The Government should use the same ordinary common sense that you and I use in our own business or that we would use in this matter if this was our water power and we were spending our money. We would take what we have there now and use it to the best advantage to develop this art to make cheap nitrates; we would redesign the two plants there to meet present needs, and we would not spend, probably, any more money in building any more dams after finishing Dam No. 2 until there was need for more power and until we had developed the art a little further and learned to make nitrogen cheaper. Everybody expects some morning to wake up and find that, if we have not learned it ourselves, somebody else has discovered some cheaper method or some better process. The whole world is seeking for it, and we are sure soon to find a cheaper method; it will come.

Then we should not scrap, but we should conserve what we have and use it, and also run a research plant there in connection with these two nitrate plants, until either we or somebody else discovers how we can make the nitrates for fertilizers cheaper; then we should build Dam No. 3 at once and at the same

time put in additional nitrate plants and do it at once, and as fast as necessary utilize all of that tremendous water power in making cheap nitrates for cheap fertilizers. When that time comes, we will build the extra dams—Dam No. 3, No. 4, No. 5, and No. 6, and storage dams—way up to the headwaters of that river. This is what our proposal contemplates, and further to use all this development in producing cheaper nitrates.

In this connection, I wish to point to the fact that the Haber process as now operated in a small way at Syracuse, and as designed during the war to be used at Muscle Shoals, did not contemplate producing a nitrate suitable for fertilizer but a nitrate for explosives, and, therefore, if we had finished plant No. 1 and had operated it successfully, it would now be necessary to make certain changes or additions in order to make the nitrates needed for fertilizers. It is perfectly simple and easy to make the necessary changes to produce a nitrate fit for fertilizers. We know now how to make a soluble nitrate that is fit for fertilizers at both of these plants by redesigning them, and that can be done within the cost I have given you.

Indeed, Mr. Chairman, we have learned a number of things we did not know when we built those two plants. For instance, we get our hydrogen in nitrate plant No. 1 by passing water over heated coke; the oxygen is absorbed out of the water and that leaves the hydrogen. That is a well-known process now used in Germany and also used at Syracuse and that part of it was successful down there during the war; and, in redesigning the plant, we probably would leave that part of the process in for the present; but it is not as successful as another process that we have improved since the war for getting the hydrogen out of the water. But this improved process I am speaking of is one you can not use economically unless you have cheap hydroelectric power, and therefore in redesigning that plant we would keep the coke and water method for the present, because we would use the steam plant until Dam No. 2 is completed. I do not know whether it has been brought out before the committee or not, but there is a complete steam plant not only at plant No. 2 but at plant No. 1, standing there ready to operate now. As soon as plant No. 1 can be redesigned with the new catalyst, we can start it up with that steam plant and begin to produce agricultural fertilizers before we can get the dam completed for making hydroelectric power; but the minute we have got the hydroelectric power, it would be economical and desirable to still modify plant No. 1 by putting in an electric process by which you can separate the hydrogen from the water without passing it over heated coke. Our Government has built the longest and most efficient electrolytic cell known since the war for this very purpose.

But it requires a good deal of electric power, and when we have cheap power it is done better by electricity than it can be done by the other process. When the electrolytic cell is put in, then we can use the liquid air method for taking the nitrogen from the air, which is cheaper than the method used by Germany and also being used at Syracuse, N. Y. I am simply mentioning that to show the progress the art is making. Even to-day in redesigning that plant to run by steam power we would not change it as much as we will when we finish the dam, in order to get the best results; but when the dams are finished, we can have a perfect plant operated according to the latest methods of getting the hydrogen out of the water and the nitrogen out of the air, which methods we can not use with a steam plant. So all of these things can be done by the time Dam No. 2 is finished.

Now, when we come to plant No. 2, it is a simple matter to redesign that plant. The process for making a nitrate for explosives and a nitrate for fertilizer is exactly the same under the cyanamid process down to the last step you take.

When you get to that step, if you want to make a nitrate for explosives, you treat it with nitric acid, and if you want to make that nitrate for fertilizers, you treat it with sulphuric acid, which is cheaper than the other method, so that you can produce the sulphate of ammonia cheaper.

That is the only difference, therefore we would have at nitrate plant No. 2, by simply adding the sulphuric acid equipment, a plant ready to make both kinds of nitrates at all times, and at the highest estimate, as given here, I think, by both General Williams and Major Burns, of \$3,000,000.

So with these two plants redesigned we would be in the position where we would be producing this nitrate for fertilizer, ready at any minute to make a nitrate for explosives, by two methods. Then by operating a research plant for the development of the Haber process we are in the best possible position, Mr. Chairman and gentlemen, to have a chance to go over the top before any

other country. In discovering a still better and a cheaper method, because the best way to learn to walk is by walking, and the best way to develop this art is by doing it and working upon it.

We have learned something in every war we have been in, and then we go back and rust and do not learn anything more until an emergency forces us to do something. It is time we were learning to be progressing all the time and not when dire necessity or a gun is in our faces. This young Jonathan has been so intoxicated with the wealth of his continent, which nature stored up here for us during all these years since creation, that we have spent it and wasted it—been like a drunken sailor; nationally, we have not thought except when we were pinched; we are getting old enough to quit that and begin to think, conserve, and develop every hour in peace as in war, as all high-class nations must do if they are going to keep up in the world procession. If we had not been of that go-lucky temperament we would not have been caught in the last war where we could not get enough nitrates even for explosives; we found our supply from Chile in danger any minute of being cut off; we did not have enough for explosives, and none for agriculture. I was forced to make two crops without nitrogen and exhausted my soil so that I now need more than I have ever needed before. Now, that was the bullet and the his-cult fix we were caught in, and that is the reason we ought to develop this art.

In drawing up this proposal, Mr. Chairman, we knew that no one could to-day produce these nitrates for fertilizers and make a profit by any known process to-day, but we all expect it can be done very soon. The art is just in its infancy. We know how to make these nitrates and we are going to learn how to make them at a profit, but we do not know that yet. Now, how are you going to begin making on a commercial basis nitrates for fertilizers if you can not make them cheaper to-day than you can get Chilean nitrates or buy them elsewhere? Are we to sit down and wait and do nothing and let the rest of the world discover that for us and then probably have to buy the secret from them or find it out by accident?

It was to meet this situation that we have tried to work out a plan by which we could begin at once producing these nitrates at both plants by both methods, and continue to produce without asking the Government for a subsidy. The only way the Government could do it would be by a subsidy, just like we will have to vote a subsidy for our merchant marine. Congress ought to subsidize the making of these nitrates if we can not make them in any other way; cheap fertilizer is even more important than a merchant marine. Now, instead of Congress being called upon constantly to subsidize the making of these nitrates until we learn how to make them cheaper, we have worked out a plan embodied in this proposal by which we will make the water power finance the making of these nitrates from the beginning no matter what the cost may be. You heard the statements about the cost of making nitrogen from the air in the form of ammonium sulphate, which was placed all the way from \$48 to \$90 a ton. Now, regardless of what that cost may be, we ought to begin making them by both processes at once; therefore we propose that we use a part of this power for running these plants and then we sell a part of it at wholesale, and use part of the profits to subsidize the making of nitrates, even at a loss. In this way the plant will finance itself.

There is a market to-day for a certain amount of power. I think the statements have been made to you that there is probably a market to-day for more than 100,000 horsepower without having to look for it or to create industries to use it, and that is probably about correct. The demand for this power will grow. We have learned that wherever we have started any hydroelectric development.

But there is a market to-day for this power; we can wholesale it to other companies that are in the power business—that is, wholesale enough of it so that we can take a certain part of the profits from its sale and finance the making of these nitrates; and, as we say in the proposal, the limitation to the amount of nitrates that we will make will depend upon how much money we can raise from the sale of power and the price at which we sell the nitrates to the farmers, as fixed by the Secretary of Agriculture. We feel that the nitrates produced at Muscle Shoals should be sold to the farmers at a price to be approved by the Secretary of Agriculture.

The very purpose of developing this water power and the governmental purpose as declared in the national defense act would justify the Government in

regulating the price at which it should be sold. Besides, it is Government money that goes into the building of these dams and the purpose is to help the public and promote the success of agriculture; you do not want the products produced by this water power held at a price that is entirely for private profit.

If the Muscle Shoals project is to be used to benefit agriculture, then the nitrates produced there must be sold at a price below the present selling price of Chilean nitrates. Now, since we can not, until the processes for the fixation of atmospheric nitrogen are improved, make nitrates at a cost less than the present selling price of Chilean nitrates, it is necessary to subsidize the making of nitrates by the sale of a part of the power developed, as I have already explained. But possibly I can make that plainer by stating it in another way: We propose to use as much of the power developed at Dam No. 2 as may be necessary to run both nitrate plants; then we propose to sell the remainder of the power to other power companies or to the public, but at wholesale; we propose to set aside 1 mill for each kilowatt-hour of power sold, to be paid into the Treasury of the United States as rental for the lease of the property. Now, if the Secretary of Agriculture should think that the nitrates made at Muscle Shoals should be sold to the farmers at \$10 a ton less than it may cost to produce them, in order to furnish nitrates at a price below the selling price of Chilean nitrates, then this loss of \$10 a ton is to be taken out of the sum arising from the 1 mill per kilowatt-hour of the power sold before that sum is paid into the Treasury of the United States. It is only by this kind of a subsidy that nitrates can now be made from the air and sold at a price less than Chilean nitrates.

But everybody expects that improvements will soon be made in the Haber process by which we can make nitrates cheaper than the present selling price of Chilean nitrates. When that time comes, we then agree to pay all of the 1 mill per kilowatt hour of the power sold into the United States Treasury. Our profits will come entirely from what we may be able to sell this power for above the 1 mill per kilowatt-hour, all of which goes to the Government. We do not propose to ever make any profit from the manufacture and sale of nitrates and fertilizers. Under an estimated development of 440,000 kilowatts the 1 mill per kilowatt-hour will produce \$3,500,000 a year, and every dollar of that will under our lease go either into the United States Treasury or be used in financing the making and selling of cheap nitrates and fertilizers, at the option of the Government. This is certainly a handsome income to the Government on the investment, and the benefits to agriculture and to the consumers will be manifold greater.

When Dam No. 3 is built and another nitrate plant is in operation there, then the income to the Government and the benefit to the farmers and to the public will be proportionately increased, and so on with all the other developments on that river during the 50 years of this lease. This is what our proposal means.

We also want the Secretary of Agriculture to regulate the amount of nitrates to be offered for sale and also the amount of commercial fertilizers. The three elements necessary in fertilizers are the nitrogen, the potash, and the phosphoric acid. Now, we can sell the nitrogen alone direct to the farmers, or we can also sell them all of the ingredients separate, or we can put them together in the proper proportions and sell them as a complete commercial fertilizer; but it is best that that work shall be done under regulations made by the Secretary of Agriculture. Why? I hope to see the time come—and even now many of the farmers are doing it—when the farmers will buy all their ingredients unmixed and mix them themselves, and they will all come to it soon. Therefore a complete fertilizer is not the ideal thing. But there should be some of the complete fertilizers prepared and ready to sell and to be used by farmers who have not yet learned to mix their own fertilizers.

Then, too, there are people who would be glad to buy cheap nitrates from us and then compound a complete commercial fertilizer, cheap enough to sell it to the farmers as cheap as we could compound it. If that can be done by private enterprise, then there is no need for us to do it, for we could then devote all of our energies to making cheap nitrates. So it seems to me that we should be permitted, under regulations formulated by the Secretary of Agriculture, to either sell these nitrates to fertilizer factories or direct to the farmers. In

other words, in that part of our proposal we have provided for doing what seemed to us to be the best thing. This, however, is a detail, but I wanted you to get the idea of how we had this thing worked out on that basis.

Now, Mr. Chairman, I feel like apologizing for taking this much of your time and for saying as much as I have said to a committee which has heard so much about this question from every angle, but our proposition is entirely different in scope and purpose from the others before you.

I have set it forth in this proposal as plainly and as simply as we could write it, without having our attention called to anything that might seem to be obscure. So I would rather explain, in answer to any questions, what may appear to be obscure.

While I think I have explained all of the vital points contained in this proposal, yet I will ask your attention to paragraphs 11 and 12.

You may be curious to know why we put them in and why they are so worded. It is done out of an abundance of caution from the standpoint of prudent business men and experienced engineers. We do not want to be connected with anything that would be a failure. Governments often waste money because there is not any chance to stop and think while the work is being done and the money is going out.

We are asking for a lease for 50 years. We expect to operate this property successfully for 50 years, and we do not want any construction on this project that is not going to last 50 years and more. We do not want to be a party to the money being spent and not get the best results; besides, faulty construction will seriously affect the value of our lease, if not destroy it. This is true not only as to the building of the dams and the reservoirs but also as to the remodeling of the nitrate plants and the construction of new nitrate plants. We want the closest inspection both by the Government engineers and by our engineers or inspectors, so that if there should be a difference of opinion we could stop, before another dollar is spent, and have the highest authorities pass upon the work. We consider that as important to us as if we were spending our own money. This matter of the best possible construction is so important that we have already arranged for the services of one of the greatest engineers in this country to take charge of supervising and directing this construction if we shall be awarded this lease.

In drafting section 17 we looked ahead to the time when more dams and more power will be needed to make more nitrates and more fertilizers.

In drafting section 18 we again looked ahead. Our idea is in the beginning to finance the making of the nitrates and to use every dollar of the 1 mill per kilowatt-hour from the sale of power, if necessary, in making nitrates even at a loss. It will not be long, however, before we will be making those nitrates at cost or a profit. When that time comes every dollar which has gone into financing the making of nitrates will go into the Treasury. So we are offering to the Government a handsome return for the investment, which goes either into the financing of the production of nitrates, or, when it is not needed for that, which goes into the United States Treasury. Therefore it becomes a trust fund, which goes sacredly to one purpose or the other.

Now, a word in regard to section 19; after this proposal was printed it occurred to us that further words might have been put into or added to that section in order to clarify the meaning as to how the cost of construction is to be determined. The word "cost" with a percentage to be paid thereon, it has occurred to us might be construed to mean cost such as we had unfortunate experiences about during the World War. We have fresh in mind the fact that if a percentage is to be paid on costs, human nature often does not limit the cost, but the tendency is to make the cost run higher than it ought to. We had in mind, when we wrote that section, that the cost would be a matter to be determined by the lowest bid and to be approved by the Government. So we have prepared this amendment, which we wish to go into the record and which we want to be considered as a part of section 19. The amendment reads as follows: "The cost in each case to be determined by the lowest responsible bid resulting from a public offer by lessee, and by the contract awarded by lessee to such bidder, subject to approval by the Secretary of War."

This makes it perfectly clear and certain that the work will be done at the lowest possible cost; and it will also be done in the most efficient manner, because, as I have said, we will have there in charge one of the best engineers in the country to-day. Our idea has been always that we would submit all the

construction work to public bidding, because we can in this way get responsible contractors with their complete equipment and in the business, who can unquestionably do this construction work cheaper than we could by forming an organization to do it, or cheaper than the Government can do it, because they are engaged in that kind of work all the time.

There are responsible concerns for doing such work, who go from one job to another, and their organizations are at the highest state of efficiency and equipment all the time. So we would have all that work done by contract and let it out to the lowest bidder, always, of course, subject to the approval of the Secretary of War. That is the way it would be done, even if there was no language of this kind added to section 19.

In reading over this proposal many times I did not see any other changes or additions that I could suggest to clarify it, because the language is very plain and direct; but, of course, a person who writes a thing may not see its defects, because you have in mind when you write it what you mean, and you may fail to express it in words; so that is the only change or addition I could see that was necessary to clarify its meaning.

Now, Mr. Chairman, I think it would conserve time, if it is the pleasure of the committee, for me to answer questions that may occur to any members of the committee.

The CHAIRMAN. Senator, as I caught the reading of your proposition, the Government puts up the money?

Mr. BUTLER. Yes; the amount necessary to finish Dam No. 2 and to make the initial changes necessary in nitrate plants No. 1 and No. 2.

The CHAIRMAN. For the various things that are to be done, and Mr. Engstrum is to be the contractor to carry out those things.

Mr. BUTLER. Yes; and also to operate the plant as lessee. As such lessee, under his bond, he will superintend the completion of Dam No. 2 and the redesigning of both nitrate plants and then put it into practical operation under a 50-year lease. I want to say that the matter of completing these jobs is secondary to us. We are willing for the Government to do that, and then lease us the completed plant; but somebody has to finish Dam No. 2 and redesign these nitrate plants before you can ever use them.

The part of it that we are interested in primarily, and that appeals most to me, and, I think, to the public, is the operation of this property as provided in the national defense act. We have made what we think is a fair and just business offer to the Government for this incidental, initial stage of necessary work to get ready to do business. The lease under our proposal covers the whole business, and if it is given to us in that shape we will put the property in operating condition and then operate it. We are not buying anything; we are not taking the Government's title. We are simply offering to carry out, as we see it, the declared governmental purpose in connection with this property, and then to turn it back at the end of 50 years if the lease is not renewed, in as good condition, or in better condition than we get it, because under our bond it must be in good operating condition at the end of 50 years.

Mr. MCKENZIE. The idea of your proposition is that the Government shall carry out these various projects that were contemplated, with the lessee getting a finished plant, and it will do certain things.

Mr. BUTLER. As we understand it, the Government now intends to carry out the purposes of the national defense act, but the purpose of the Government now seeming to be, instead of doing it as a Government project, as was started in time of war, to do it through a contract in peace times, with some individual or corporation. So we offer now to carry out for the Government that purpose declared in the national defense act.

Mr. MCKENZIE. I see your position on that very clearly.

Mr. BUTLER. We offer, if the contract is awarded to us, to go ahead on a business basis to carry out that purpose. The necessary first step is to complete the project and next to operate it—we offer to do either or both. The lease and operation of the property is the important thing but the necessary construction work to get it ready to operate must be done by some one.

Mr. MCKENZIE. Senator, you are here representing Mr. Engstrum, who, in the way, is representing a corporation to be hereafter formed, but which is not now in being, and which under you plan will become the lessee of the Government for the purpose of carrying out the conditions set forth in the contract?

Mr. BUTLER. Yes.

Mr. McKENZIE. Now, Senator, I think it would be very beneficial for us and help us out very much if you would give us a brief analysis of just exactly what you expect to give to the Government and what you expect to get in return, and then we can ask you some questions about that. You can tell us what you expect to give to the Government as a consideration, and then what you expect in return. I think we can, perhaps, get along better in that way.

Mr. BUTLER. We tried, primarily, I will say, to figure out a proposition on a different basis, to agree to finish this unfinished work for a fixed sum, so as not to have any question of the amount of the cost to the Government; but we found great difficulty in offering you such a lump-sum proposition, as we could look you in the face and say it was absolutely fair, that it was as low a figure as we could do it for and make a living profit, and feel that we were safe, under a bond, and not go into bankruptcy. There was a wide diversity of opinions between our own engineers and the Government engineers as to what it would cost to do the necessary construction work. We do not want, and we felt confident that the Government did not want, any cheap work done on this great project. This is a great proposition and the work should be as durable, if possible, as the eternal rocks on each side of the stream.

Every time we put on paper a fixed amount that we felt would be safe for our bondsmen and for ourselves, we had to put the figure, in order to be safe, higher than we believed it would cost, because if we did not do that we might go broke. And finally, as a matter of good conscience and a matter of good business, we came around to this proposition, as stated in section 19, to put it as a cost proposition.

Now, as to the advantages to the Government: Well, broadly speaking, this proposal will give the Government exactly what it has declared it wants. The only question is, are we offering to do it on a fair business basis and on the best basis on which a responsible individual can do it. That is the point, and that is where, finally, the question is directed as to what we are offering to the Government and what we are expecting to get out of it ourselves.

First, we propose to finish Dam No. 2 and to redesign both nitrate plants in a way which will guarantee the best possible construction, and at a cost which we believe will be less than the Government can do it. We will be lucky if we make any profit on that.

Next, we propose to lease the whole property and to devote it entirely to the making of nitrates; and we all know that when you have devoted the whole thing to that one object you will produce more nitrates and get greater progress in the art of the fixation of atmospheric nitrogen than if you divided up the proposition and leave the making of nitrates as a minor consideration. We will devote the whole Muscle Shoals project to this one purpose. We will operate both of those nitrate plants. There is a steam plant at nitrate plant No. 1, and also a steam plant at nitrate plant No. 2. We would have also the Warrior steam plant, which we propose to lease along with this property. The Government has them there, all built for this purpose. We would begin to operate at once with that power. When we get Dam No. 2 finished we figure to keep the steam plants in a standby condition to increase the amount of primary power when necessary. Say that we produce 100,000 kilowatts of primary power, we could add another 100,000 primary power by operating those steam plants for 10 or 15 per cent of the year, during the low-water period. But we can, of course, run these steam plants for a longer period, or all the time, if necessary. That would make a peak load all the time, if we did that, of 440,000 kilowatts.

Now, we would do that if there was a market for it and we could sell it.

We propose to sell power, as much as we can make to sell, above what is required to run the two nitrate plants, and it is to our interest to sell all we can at a profit, and to devote one mill per kilowatt hour of the power sold to financing the production of these nitrates, because we are going to begin at a loss; everybody knows that. We set that aside as a trust fund, to be given as rental for the lease, in addition to the power that is necessary to run the two plants. Then we agree to sell the products that we produce and add to that fund, it being a fund which belongs to the Government to go into the Treasury, or into the financing of nitrates. We figured with the one mill per kilowatt hour on the power sold, based on a development of 440,000 kilowatts at Dam No. 2, that the income to the Government will be, in round numbers, \$3,500,000 a year during the whole length of the lease from Dam No. 2 alone;

and if either goes in cash into the Treasury, or it goes into the production of nitrates. That much is certain. We are giving the Government the certain end of the proposition.

Our proposal also provides that when there is a need for more power and more nitrates that we will build Dam No. 3 and put a nitrate plant there also. Thus the return to the Government and the benefits to the farmers will be increased in proportion to the increased power developed there; and so on until all the water power is developed.

The next part of the question is, What are we going to get out of it? It depends on the amount of power we are able to sell and the price we can get for it. We reserve whatever we get for that power above 1 mill per kilowatt hour for our compensation, and that is the only compensation we get. I say to you frankly that it is a proposition on which we were taking the chances, and on which we were giving the certain end to the Government. That is about as definitely as I can answer your question. Does that answer your question?

Mr. MCKENZIE. In a way it does. You have answered it in a way, but not entirely to my satisfaction. I want to say, Senator, that your statement on the general proposition, in my judgment, was a splendid, enlightening statement. That is a matter we are all interested in, generally. But what we are interested in at the moment is the proposed contract or offer by Mr. Engstrum.

Mr. BUTLER. That is why I stopped talking; I knew you were interested in the details of this proposal.

Mr. MCKENZIE. You have come to this committee empty handed, to begin with—without a dollar?

Mr. BUTLER. Yes; so far as putting our money into completing this project.

Mr. MCKENZIE. The first proposition is that hereafter there will be a corporation formed?

Mr. BUTLER. Yes.

Mr. MCKENZIE. Will that corporation own stock?

Mr. BUTLER. I will tell you frankly what we have in mind. We will form a corporation, but we have not yet agreed on any amount of capitalization, because we are giving a bond, and we did not think it was necessary to guarantee a large paid-up capital.

Mr. MCKENZIE. You have not thought of the amount of capital stock?

Mr. BUTLER. We have considered that entirely immaterial since we are giving a bond. But if it is desirable, if it cuts any figure, we are ready to meet any suggestions the committee may make along that line. But it never occurred to me that it would be considered essential, if you thought you were dealing with responsible people, as individuals, regardless of how much wealth we might have. But we are ready to give any bond which may be required—with a sufficient bond the personnel of the company is, of course, important to insure the greatest results—that will produce the greatest good. I want to say in this connection that I have given that matter a great deal of consideration, because I will be one of the directors of that company myself. This subject has gripped me so that I have decided to stay with this company as a director and as general counsel; I do not know of anything that has ever appealed to me so much; and, if you give us this contract, the rest of my life will be devoted to developing this proposition. I shall devote my best efforts to developing this great water power in a way to be a credit to this administration and to the Government, and to producing the most beneficent results for agriculture and the public good—I intend to devote my whole life and time to it.

Mr. MCKENZIE. My question was not prompted by any idea that I had any fear that the Government might lose out. But it was in connection with my question as to what you expect to get out of this contract.

Mr. BUTLER. The organization of the company is purely a question of business. Of course, Mr. Engstrum or I could seek this contract as an individual and go ahead and do it, but we all know from business experience that it is much more desirable to form a corporation to carry out such a program for a term of 50 years. We expect to bring men into the company who will be worth something not only for their means but also because of their experience and standing, selected with the same care, almost, as you would select an engineer of the greatest ability and reputation. And, of course, we expect to make money operating this plant.

Mr. MCKENZIE. Let me put it in another way. As I have said, you come to us empty-handed, not proposing to finance any proposition. You form a corporation to become a lessee of the Government, and then as lessee you proceed to

do certain construction work for the Government to carry out the purposes of the Government, the Government furnishing all the money, the company getting a fee as compensation for the construction of those various plants necessary to complete the project.

Mr. BUTLER. We are willing to accept a contract from the Government to-day to finish the work on a fair basis, and then lease it when it is finished. The construction part, however, is incidental.

Mr. McKENZIE. As the proposition stands, that is the first thing?

Mr. BUTLER. Yes; because it is the first thing to be done. Somebody had it to do, and as I understood it, the Government was looking for somebody to take the whole thing off its hands, both the construction and the operation of the whole project.

Mr. McKENZIE. That would be your first consideration, the first part of your performance?

Mr. BUTLER. Yes; the first part is to make the plant a going concern.

Mr. McKENZIE. You would put up the structures?

Mr. BUTLER. Yes.

Mr. McKENZIE. And the Government would pay you 5 per cent in addition to the cost; that would be the consideration?

Mr. BUTLER. Yes.

Mr. McKENZIE. Now, you start to operate the plant. Do you pay the expenses of operation?

Mr. BUTLER. We pay the expense, as operating expense, out of the proceeds from the plant.

Mr. McKENZIE. Where do you get the proceeds?

Mr. BUTLER. We propose to begin the sale of some power at once, and we propose to begin to operate those nitrate plants, or one of them, very soon. We have the steam power, and as soon as we can redesign this plant we will be making nitrates. We will be able to sell steam power, no doubt, because the Government is selling it now. We will be a going concern long before Dam No. 2 is finished.

Mr. McKENZIE. You have stated you could not manufacture that at the steam plant without being compelled to sell it at a loss?

Mr. BUTLER. We hope to be able to sell enough power from these plants while we are redesigning the nitrate plants to help out our operating expenses; we would utilize everything possible while we are redesigning those plants. We will make up the remainder of the operating expenses from our own funds.

Mr. McKENZIE. You can probably see the purpose of my question about the corporation and your capital stock. If you organize without capital stock or without funds, you would not probably operate very long. If you were compelled to sell this product at a loss.

Mr. BUTLER. We have, of course, foreseen all of that and have our arrangements made, so that we will not be living from hand to mouth each day until we have a live, going concern that will be making a profit for us and also for the Government.

Mr. McKENZIE. Let us go a step further. The dam is completed—

Mr. BUTLER (Interposing). Of course, we all know that we must have the requisite amount of capital to do anything.

Mr. McKENZIE. You get the dam completed, and the use of the waterpower, and then you take a certain portion of that power, as I understand it, and utilize it in the operation of these plants?

Mr. BUTLER. Yes.

Mr. McKENZIE. What do you do with the balance?

Mr. BUTLER. We sell it; we will wholesale it.

Mr. McKENZIE. Now then, out of those sales you get a certain income?

Mr. BUTLER. Yes. We get all above 1 mill per kilowatt hour for all power sold.

Mr. McKENZIE. What is your purpose regarding the use of that income, disposing of the income?

Mr. BUTLER. The first thing we do is to set aside the rental which we will pay the Government; that is made up of 1 mill per kilowatt hour, no matter at what price we sell. If we only sell the power for 1 mill per kilowatt hour, it all goes to the Government. That much goes to the Government certainly, whether we get any more or not; and that sum goes into the Treasury or is used for financing the making of nitrates; that is a certain, definite, continuous rental, to be increased as the sale of power is increased. Our profits are, in a way, speculative; we get for our own use all that we may be able

to sell power for above the 1 mill per kilowatt hour. We have tried to base it on a live and let live proposition, giving the Government the certain end of it; our end being speculative, more or less.

Mr. McKENZIE. What would be the proportion of the income that would go to the corporation?

Mr. BUTLER. That would depend entirely at what we could sell the power for.

Mr. McKENZIE. You intend to sell the power immediately in order to get a working fund, as I understand it?

Mr. BUTLER. Yes; what is not needed for the plant.

Mr. McKENZIE. After you have the two plants in operation, about what would be the proportion that would go to your company? I understand you can not state that exactly.

Mr. BUTLER. It will take only about 100,000 horsepower, or less, to run both nitrate plants. We can produce about 650,000 horsepower, or about 440,000 kilowatts, by running the steam plants also. But we would not run the steam plants to supplement the water power unless we could do it at a profit; but we expect to be able to produce at least 200,000 horsepower continuously by running the steam plants only about 15 per cent of the time, and we ought to be able to make more power than that at a profit. We may not be able to do it; but we expect, as time goes on and as the country down there develops, that our profits will be larger than they will be to begin with, figuring the demand for power and the price for power. Of course, the price of coal has a lot to do with it.

We all know that this property, when we have run it for you for 50 years, is going to be worth many times more than when it starts. We expect the time to come when we can build more dams and nitrate plants, all these storage dams, and largely increase the output. These things are not justified to-day because we can not now make money by doing it. So the time will come when the returns to us and to the Government will be much increased.

Mr. McKENZIE. You would expect at once to enter into competition with the Alabama Power Co. in the sale of current, would you not?

Mr. BUTLER. We have no idea, unless forced to do it, to go into the commercial sale of power by retail. We hope to be able to, and we think we can, sell at wholesale to all the power companies around us. All we have to do is to tie in with them, and they will, no doubt, want to do that. We know enough about the business, about the people in the surrounding country, and about their demands to know that we can not produce cheap power there without it being to the interest of the power companies to buy and distribute it around to the cotton mills and factories who want it. The Alabama Power Co. has shown you that they want to-day about 100,000 of this horsepower; that they have a market for it, as I understand the testimony. I think we would have customers right there for all of it, if we would let them have it all. I think every power company around us will want to tie in with us, and I think they would build connecting lines to get some of it. We believe that we will be able to dispose of all of that power to advantage, and it would be an increasing amount. It will not be 10 years, or probably 5 years, before the Government itself, without our urging it, would want us to build Dam No. 3, and then after that other dams, and then storage dams. All of that is going to come to pass.

Mr. McKENZIE. You, in your opening statement, drew us a beautiful picture of the growth and development of the industry, of the manufacture of fertilizer, and said that in time possibly all the power produced there could be utilized in that way?

Mr. BUTLER. Yes.

Mr. McKENZIE. When that day comes, where will you get your profits?

Mr. BUTLER. We agree to furnish the power necessary to serve both nitrate plants from the power to be developed at Dam No. 2, and to sell the remainder, giving the Government 1 mill per kilowatt hour on all power sold and keep the remainder for our profits. When more dams are built and more nitrate plants are erected by them then we must have the proportion between the power produced and the capacity of the nitrate plants the same, or there would have to be a new adjustment as to our profits. Of course, we will always be forced to sell a certain amount of power or there will be no profits. We can never use it all in making nitrates without changing the contract.

Mr. McKENZIE. Then I misunderstood you as to your plan. Your plan, as you have it in your mind is that you will furnish sufficient power to operate these two plants at Muscle Shoals, and whatever surplus there is you want to sell.

Mr. BUTLER. Yes.

Mr. MCKENZIE. I got the idea that it was your hope at least that while this is a matter of experiment, up to this stage, that the Government will go on experimenting and as this develops that in time all this vast power at Muscle Shoals could be utilized in the production of fertilizers for the farmers of this country. I got that idea from your statement.

Mr. BUTLER. What I intended to say is that we devote all the power necessary from Dam No. 2 to the making of nitrates at these two plants and sell the remainder of the power to finance the operation, 1 mill of each kilowatt hour sold going to the Government and the remainder to us for our profits. Now, that is what we will do with the one dam and the two nitrate plants.

Of course, when Dam No. 3 is built we will put in another nitrate plant, and if its size is in the same proportion to the output of the dam, then our proposal will apply to it the same, and if not, the difference can then be adjusted; and so on with the whole development of the river. But when we can make nitrates at a profit, then the returns to the Government will be greater.

Mr. MCKENZIE. My reason for asking about your profit in case you utilized all the water power in the production of fertilizer, is because in your contract, as you have submitted it, you would then be dependent upon the will of the Secretary of Agriculture as to the amount of your profit; is that not true?

Mr. BUTLER. We can never sell nitrates under our proposition at a price higher than he would approve of.

Mr. MCKENZIE. If all the power was going into the manufacture of fertilizer and you were not selling any, for general use, then you would be dependent, under your contract, for any income or profit upon the will of the Secretary of Agriculture?

Mr. BUTLER. We had thought of that, and that is why we do not propose to make any profit from the sale of nitrates and fertilizers, and this is the only sure way to guarantee cheaper fertilizers to the farmers; it is not our idea that any of the fertilizers will be sold at a profit.

(Thereupon, the committee took a recess until 2 o'clock p. m.)

AFTER RECESS.

The committee met pursuant to recess at 2 o'clock p. m.

STATEMENT OF HON. MARION BUTLER, ATTORNEY FOR MR. FREDERICK E. ENGSTRUM—Resumed.

The CHAIRMAN. Senator, Mr. McKenzie this morning, when we adjourned, had finished asking you such questions as he desired to ask, and we will continue, if you please. Mr. Hull would like to ask you a few questions.

Mr. HULL. Senator, I am considerably impressed with some features of your proposition, and especially with the preservation of nitrate plant No. 1. I think that should be done in any case. What is your estimate as to the capacity of that plant, if it is made available as at present planned.

Mr. BUTLER. The statement of the Chief of Ordnance is that if modified and made an operating plant, according to the plans they had in view, the capacity would be 30 or more tons per day of ammonia.

Mr. HULL. It is a very small plant, then, in comparison with No. 2.

Mr. BUTLER. Oh, yes. You see, when they built that plant on the Haber process, we did not know all of the process; it was an experiment, so we were not going into it on as big a scale as on the cyanamid process, which we thoroughly knew. We built it as far as we knew how to build it by the Haber process, experiment on the remainder; it was built small with a view to trying to work out that process, feeling that we ought to have both processes. The idea was to enlarge it, if it was a success. We know now how to equip and run the best Haber process plant in the world. What we consider now to be the most economical thing to do, is to complete it by the improved methods which we have worked and put it to work at once. It would be better to build a larger plant, if we were starting out initially, but the sensible thing to do now is to complete it as it was started. There is a complete steam plant standing by it, so we could begin to operate this plant before Dam No. 2 is finished.

Mr. HULL. And that plant, as I understand you, would make about 10,000 tons per year or about one-tenth the capacity of plant No. 2.

Mr. BUTLER. A little more than that. It is three times as large as the Haber plant at Syracuse.

Mr. HULL. Yes; just a shade more. Have you any estimate as to the cost under that system compared with the cost under the cyanamid process?

Mr. BUTLER. Germany and the Syracuse plant have proven that it is much cheaper and it will be very much cheaper when we can make the changes and improvements which I indicated this morning, the new catalyst and the new electrolytic cell for getting the hydrogen instead of passing the water over coke to separate it. When we can use the hydroelectric power, it will be much cheaper, and that is the line of development along which the world expects to see great progress made in the fixation of atmospheric nitrogen. The new catalyst, which is the most efficient in the world for joining the hydrogen and the nitrogen we will put in at once. The electrical process for producing the hydrogen we will put in when the hydroelectric power is available; and then we will also put in the liquid-air method for getting the nitrogen from the air, which is also much cheaper than the method now used at Syracuse and also now used in Germany. When that is done we can produce nitrogen for fertilizers much cheaper than anyone else is doing it, and very much cheaper than it can be done by the cyanamid process.

Mr. HULL. You say it will be much cheaper; how much cheaper, proportionately?

Mr. BUTLER. That is difficult to say.

Mr. HULL. Yes.

Mr. BUTLER. We do not know until we do it. Germany is the only people who are doing that. At Syracuse they are simply going to the point of making the ammonia, and they stop there, but they are doing it cheaper than they thought they could when they started and are making progress. So we are on the edge of development; it is an undeveloped art with great possibilities so far as we know. Germany is very successful with the Haber process, but she is experimenting all the time. She made 300,000 tons by that method and is gradually dropping the cyanamid process. Germany made only 100,000 tons by the cyanamid process last year, and she is now pushing the Haber process because it is much cheaper.

Mr. HULL. You incorporate in your proposition the purchase or the turning over to you of the Warrior or the Gorgas plant.

Mr. BUTLER. Yes; we lease it; it is necessary at present. We might develop enough power so that it would not be necessary later, but we need it for the construction work and to operate the plant successfully until we get the dam built; it is the cheapest power we can get. It is cheaper to get it over the transmission lines from the Warrior plant than from the two stand-by steam plants that are there now, therefore it is very desirable. If the Government wanted to sell it later, that would be a question for negotiation; but it is needed for the economical use of the property for the present, certainly.

Mr. HULL. I am rather uncertain in regard to that Gorgas plant. Perhaps if I was down there and could look it over, I could get the proper angle. You all seem to want that Gorgas plant. It is 80 miles away from Muscle Shoals.

Mr. BUTLER. Yes.

Mr. HULL. And it is simply a duplication, so far as your plant goes, of the steam plant you already have, or would have.

Mr. BUTLER. It is right at the coal mines. You see, it is cheaper to transmit electricity than it is to haul coal.

Mr. HULL. Yes; but you do not, any of you, figure you would need it after you get the dam completed.

Mr. BUTLER. Well now, frankly, we could use it all the time in this way: In making more than 100,000 primary horsepower from the water power for the 365 days' peak load, we could increase that primary power by supplementing it with steam power and do it cheaper from that plant than from the two stand-by plants, and to that extent it is a matter of continuing importance; just to that extent, and that extent only.

Mr. HULL. I presume you think, then, that the Government would have the right both legally and morally to take that plant away from the Alabama Power Co.?

Mr. BUTLER. We, of course, do not desire to become a party to that controversy, and it does not enter into our proposition at all. You see that controversy is in case the Government was to sell it. Our offer is the use of it under a lease that would come, as we take it, within that contract which the Government has with them.

Mr. HULL. But, if we should accept your proposition, you certainly would become a party to the taking over.

Mr. BUTLER. We take it over as lessee. We would simply operate it just as it has been operated by the Government, and for the same purposes.

Mr. HULL. And, assuming it costs five or six millions of dollars, that cost would go in against the proposition, would it not?

Mr. BUTLER. Certainly. But the Government owns the larger part of that plant already; and, as I have stated, it is essential until we build the dams and is desirable afterwards. We could sell the Alabama Power Co. all the power that they need for their customers, and that is all the need they have for that plant. So, there should be no litigation about it under our lease.

Mr. HULL. Now, there is another part of your proposition that I want to ask you about, and that is, you do not have any capitalization or any paid-up capital in your proposed company. That was gone over this morning by Mr. McKenzie.

Mr. BUTLER. Yes; we have not yet stated the amount of our capitalization for the reasons given, and because the bond covers faithful performance.

Mr. HULL. Now, what kind of a bond do you think could be executed that would cover a proposition of this kind?

Mr. BUTLER. It is for the faithful performance of everything we agree to do as lessee, and it is to be approved by the Government. So far as we are concerned, a bond can not be made too strict or go too much in detail, because people who expect to live up to their contracts do not object to binding themselves under a good and sufficient bond.

Mr. HULL. But what kind of a company could guarantee the proposition?

Mr. BUTLER. When we have given a bond, of course, the bonding company is liable. If our company were absolutely penniless and was not responsible for damages at all the bond would be, and besides our company will be composed of men of some standing and responsibility, and also men of a good deal of means, but the bond is the important thing. I should take it that if we were worth an aggregate of one thousand million dollars, you would want us to give a bond, because our assets, in case of death, are wound up in a year, and money can disappear, but a bond is good for the whole period. So, the bond is the thing that the Government needs, no matter if the five richest men in the United States were our stockholders and directors.

Mr. HULL. Then, the bond you contemplate is your own personal bond and not the bond of a surety company, is that it?

Mr. BUTLER. We can make the bond either way; but the best way, of course, is for the bond to be given by a bonding company. We pay for the bond. The bonding company is responsible in damages. Now, it does not make any difference whether it is an individual or a company, we pay for the bond, and we are able to do that.

Mr. HULL. Yes; but is there a bonding company that could guarantee a contract the size of which this will be?

Mr. BUTLER. We think so. We have looked into that and we are assured that we can give the bond, otherwise we would not be here with an offer.

Mr. HULL. Well, I do not know, but I rather doubt it, because, if I remember correctly, there is a law somewhere that prevents the Government from taking a bond from a surety company for over 10 per cent of their entire capital stock.

Mr. BUTLER. I am not familiar with such a law.

Mr. HULL. I do not think there is any company in this country large enough to guarantee this contract under that rule. I may be mistaken.

Mr. BUTLER. As for that matter, we could give several bonds in different bonding companies. Besides a bond, I take it, would cover the faithful performance, not in a blanket way, but would be divided into sections, and any failure to perform would be a forfeiture under that section of the bond at once, so that if we failed at all, it would not be a question of going on indefinitely and continuing to fail, but we would be responsible under the bond the very first time the Government would call upon our company under any clause of the bond for any part, or for our first failure to perform; and, of course, if we have defaulted on the bond in one respect, we would be called to account at once in damages; so I can not see how the bond would be required to be as enormous or as large as if we agreed to build the dam and do all the construction for a specific sum; because in that event, we would, of course, have to have a bond big enough to cover a fixed amount of money. However, we made

no conditions about the kind of bond, and we feel entirely confident that we can satisfy the Government with a bond, and can give any reasonable bond that is asked.

Mr. HULL. If I understand your proposition correctly, in a way, it is a profit-sharing proposition for the Government on the entire project, the Government to furnish the money to complete the project and to pay a certain amount, I think, 5 per cent on the cost, and then to share in different ways in the profits therefrom; is not that it?

Mr. BUTLER. Well, we pay a rental for the lease and it is based on profits, but it had not framed itself in our minds in just that way. This proposal has been drawn as a result of trying to find some practical business method on which we could undertake this great proposition and do it in a way that would produce the results that the Government expects, and, at the same time, be safe for us to do it from a business standpoint. It is a difficult problem to draw a lease contract to operate over a period of 50 years, and we have had great difficulty in doing it; we have changed the form of it a number of times, trying to simplify it, and that has been a very difficult thing to do. Now, we have done the best we could, and, as Mr. Engstrom stated to you, we are ready to modify it within any limits that would leave it a decent, sound, business proposition, because the purposes that are set forth here we intend to carry out, if given the contract, and we are willing to be bound in the greatest detail to carry out these purposes.

This is not a philanthropic offer any further than the results to be accomplished will be of the greatest public benefit, and the Government will get a handsome return on the investment, while, at the same time, we will make, not an immense fortune, but a good and a reasonable profit. We propose to carry out a great public purpose to result in great public good, and we guarantee the Government a definite rental for the lease, that rental to increase as more power is developed.

Mr. HULL. As I understand it—

Mr. BUTLER (continuing). And we could not see any better way to do it than to guarantee to the Government a certain definite income from the sale of power not needed to run the two nitrate plants. Our profits are to come from the same source; the nitrates are to be sold at cost or less—no one is to make a profit on that. This, I submit, is a simple proposition and a fair and just one.

Mr. HULL. You would not object seriously if convinced that certain parts of your contract should be changed in order to make it a better contract for the Government, if we saw fit to ask you to change it, and you would agree to that?

Mr. BUTLER. No; and we so stated this morning; and, while that point is up, I will say right now that I have been asked since the morning session for a further explanation about that amendment which we offered to section 19. The question is: What profit would that mean to us, and what do we do to earn it. I will answer that now:

Under what were known as cost-plus contracts during the war there was no limit to cost and really an inducement to increase the costs. Under section 19 of our proposal, as amended this morning on our own motion, all this work will be done by the lowest bidder, and the lowest bid will determine the basic cost, but that does not include overhead or any engineering charges, and the percentage fee of 5 per cent paid to us for superintendence and for engineers and for all that sort of thing is a most modest sum. We are offering to do that just as cheap as we feel it is possible to do it and employ the highest-class men in the country, men who are fit to handle such a proposition. That is what section 19 means, and if it is not clear as worded we will make it so.

Mr. HULL. Then this fee that the Government would pay would go directly to you personally or to the proponents of the proposition.

Mr. BUTLER. Yes, of course; and we will be very modestly paid for the service that we must render on so important an undertaking. We must not only employ the very highest class engineers and the best experts for redesigning the nitrate plants, but the administration there and every kind of overhead charge and expense in seeing that the contractors do their work in good faith, will fall on us. The Government will hold us to our bond. All of those things we have figured out, as far as we could, from every angle. The Government is not responsible for anything, and we are responsible for everything under our bond and if we can not do this and have a profit left, then we do not get any profit. It is a very small fee.

Mr. HULL. Of course, under the estimated cost of Dam No. 2, this 5 per cent would practically mean \$150,000 as a fee for the finishing of the job.

Mr. BUTLER. Out of our fee we will have to pay all expenses over and above the bid of the contractors.

Mr. HULL. And you will pay the overhead, etc., out of that and not out of the capitalization of the company.

Mr. BUTLER. Yes; if the 5 per cent fee will cover it; if not, then we will have to pay it out of the capitalization of our company. We will have to pay it from some source, or our bond will be responsible for it.

Five per cent is the usual engineering fee by itself, and we have employed already one of the greatest engineers in the country, who will carry out this construction for us. As I said this morning, but I say it again, if the Government will finish this work and then lease it to us, we are ready to make such a lease. The construction part of this proposal is an incident only, but it must be done by somebody. Now, we are willing to do it, and do it as cheap as it can be done on any decent, business basis. The finishing of the dam does not interest us much, but we do desire to redesign the nitrate plants if we are to be given the lease to operate them.

Mr. HULL. I made a mistake, did I not, in saying it would be \$150,000?

Mr. BUTLER. You meant \$1,500,000.

Mr. HULL. Yes; that is quite a difference.

Mr. BUTLER. But, as I say, it is the usual engineering fee.

Mr. HULL. It appears to me as though that was a rather large fee for simply the superintendence of the job.

Mr. BUTLER. And to cover all of the expenses.

Mr. HULL. The plans are all there and you know just what you are going to do.

Mr. BUTLER. That amount of money will not go very far during the period it will take to do all of this work, and I fear that we will be digging into our capitalization before we get through. But we say to you, have the Government finish the dam, if you think it can be done cheaper that way. What I am interested in is the lease, and in doing the things that I know we can do to add to the prosperity of this country. Besides the development of the art of the fixation of atmospheric nitrogen is a most fascinating proposition.

Mr. MORIN. Is it necessary to build Dam No. 3 in order to produce fertilizer or fertilizer compounds?

Mr. BUTLER. No; not for the two nitrate plants we have there now, and there being no market now for that much power, and the art of making the nitrates being so undeveloped, we felt there was not justifiable reason to build Dam No. 3 at this time. No business man would do it on his own hook, and therefore, we have not made any offer asking the Government to do it now.

Mr. MORIN. Is it necessary to complete Dam No. 2?

Mr. BUTLER. Yes; otherwise your property there will deteriorate and go to wrack. It will only be two or three years until what has been done there on that dam alone, at a cost of between sixteen and seventeen million dollars, will be gone and all the other property is standing idle and deteriorating. If you are not going to complete Dam No. 2 you ought to blow it up and get it out of the river. It is just a hindrance; you must either throw the whole thing up or complete it. Now, when you complete it you have two nitrate plants there with a modest outlay compared with what they cost originally to redesign them, which will be a going concern, that will render great public service and will finance itself under our proposition without any more expense to the Government; and it should soon be a money-making proposition—that is what everybody hopes and believes.

Mr. MORIN. As I understand you, plant No. 1 and plant No. 2 in operation will produce all the fertilizer that will be marketable throughout the country at the present time.

Mr. BUTLER. No; we can produce about 230,000 tons, roughly speaking, of ammonium sulphate there. You understand you can make more ammonium sulphate than you can ammonium nitrate. It is about 120,000 tons of ammonium nitrate. This would make between 2,000,000 and 3,000,000 tons of fertilizer, and our consumption of fertilizer is now about 5,000,000 tons and ought to be over 10,000,000 tons. So it would make about one-third of the fertilizer needed. That river will be developed some time, and we can and will go on and finish developing it, if we have this lease, until we furnish all the nitrates for fertilizers needed in this country, or practically so, by building Dams No. 3 and No. 4 and No. 5 and No. 6, and storage dams up the river, conserving all the water;

and the time will come when we will do that. We feel it was not wise, as a business proposition, to develop that whole river to-day, for two reasons: First, we have not the art of fixing nitrogen from the air to a point where it is a proven commercial success; that is, where it can be done profitably, and we have enough invested there, by completing it, to go on and develop the art; and, second, there is not now sufficient demand for power to justify it. There will come a time in a few years when business will grow up; manufacturing enterprises and these power companies around us will want more power and will buy it from us; but just at present that situation does not exist, and so the common-sense thing to do, from every standpoint, is to save what we have invested there and use it in the most economical way, and continue the development when called for. We can produce enough nitrates there now to have a beneficial effect upon the price of Chilean nitrates.

Mr. MORIN. Then in your judgment it is not necessary to build Dam No. 3 either for fertilizer purposes or power purposes there at the present time.

Mr. BUTLER. Not at the present time. If Dam No. 3 was finished to-day, and it was to be leased to us, the thing we would start doing to-morrow would be going out looking for somebody who would invest capital and come there and start small manufacturing enterprises around there to be customers. We would have to start out and develop that business, and it does not appeal to us as business men to do it; and we have not the face to ask the Government to invest that money and build another dam now. There is no public reason that will justify such expenditure of public money at this time.

Mr. JAMES. Senator, is there anything in the contracts between the United States and the Air Nitrates Co. and the United States and the Alabama Power Co. that would interfere with your proposition?

Mr. BUTLER. We think not.

Mr. JAMES. About how much do you think it will cost to build Dam No. 3?

Mr. BUTLER. There are no plans and specifications.

Mr. JAMES. You have not figured on that?

Mr. BUTLER. It is just a guess. The borings are not finished. The Government itself has put down about 90 borings there, but they would not start the Government engineers to building a dam at No. 3 without finishing those borings and examining thoroughly the condition of the river underneath. It is a treacherous rock, and while they feel they can master it and handle it, you never know when you are dealing with limestone and put on pressure, that the water will not find a hole somewhere and come out underneath your dam. That is a thing you have to be very careful about in a limestone country. We know generally that the dam will be more expensive for the power produced than Dam No. 2, because of the formation of the hills. You will have to have a very long dam and the hills are not high and are not close together, and you will have to build a very long dam and get less power than you get from Dam No. 2. So it is not as economical, a dam and will not produce as much power. An ordinary citizen standing around there, as well as an engineer, can look at the river and see that.

Mr. KEARNS. I have not heard the previous testimony of this witness but I would like to have the stenographer read the first question asked by Mr. James and the answer.

(The stenographer read as follows:)

"Mr. JAMES. Senator, is there anything in the contracts between the United States and the Air Nitrates Co. and the United States and the Alabama Power Co. that would interfere with your proposition?"

"Mr. BUTLER. We think not."

Mr. KEARNS. That is, you mean that under your contract you would not need the holdings of the Alabama Power Co. or the Air Nitrates Co.?

Mr. BUTLER. The contract with the Air Nitrates Co. is only in the event the Government sells, and we are simply leasing. In the case of the Alabama Power Co. the Government could lease that property just as the Government is using it now. The Government is exercising title over it and using it, and can continue to do it; and in leasing it to us, would simply be continuing to exercise authority over it as is now being done. Selling and leasing are very different things. Besides the Government owns the majority interest in that plant.

Mr. KEARNS. Then I misunderstood the question and answer. You would require the holdings of the Alabama Power Co. if your contract should be accepted. In other words, your contract covers the holdings of the Alabama Power Co.?

Mr. BUTLER. Yes; the contract covers that, and for this reason, that until we complete the Dam No. 2, we will have to use steam power. The steam power from the Warrior plant can be utilized cheaper than from the two steam plants at the property. It is at the mouth of the coal mines; that is the reason it was built there; the loss over the transmission line is small compared with the cost of hauling coal; it is the most valuable power for use in operating the plants that are there and in finishing the construction of Dam No. 2, and therefore is most desirable. It is the power that the Government would certainly use if the Government was going to complete this project itself. It would certainly hold that plant until they completed the dam, if not longer.

Mr. MILLER. Senator, I have been much interested in your talk this morning. As I understand it, you and your associates have organized what might be termed an operating company.

Mr. BUTLER. Yes.

Mr. MILLER. To carry out the peace-time purposes indicated by the original legislation?

Mr. BUTLER. And to carry out the war-time purposes when called upon. We stand in readiness in that event to either turn over the whole plant or operate it under the direction of the Government.

Mr. MILLER. It strikes me, Senator, that the principal, practical obstacle in the way of your plan is that it presupposes doing exactly what the Congress at the last Congress refused to do; that is, much to the regret of some of us, the Congress refused to complete the dam.

Mr. BUTLER. Much to my regret, as I stated this morning.

Mr. MILLER. Your plan presupposes a complete reversal of the attitude of the Congress as last expressed. The unfortunate, the very unfortunate situation, that confronts the Muscle Shoals project is the enormous cost of the development of the water power.

Mr. BUTLER. Yes.

Mr. MILLER. It seems like whoever located it there has chosen to locate it at a place where the development of the water power necessarily creates a power five or six times larger than the requirements of the plant, and therefore, five or six times as expensive. Your plan is to have the Government complete this dam on the cost plus 5 per cent plan.

Mr. BUTLER. We have used those words in section 19, but the words have been so misunderstood and have acquired such different meanings during the late war, that really we ought to have tried to find some other words; but those are the words that came into our minds, and unfortunately, we have used them.

Mr. MILLER. Yes; it is a bad word to use.

Mr. BUTLER. It was unfortunate, because our contract is not a "cost plus" one, as understood during and since the war. We fix cost by the lowest bidder and simply ask a 5 per cent fee on that low and fixed cost.

Mr. MILLER. Yes; we had a lot of experience with these cost plus patriots during the war. The Nation was full of them, and a very peculiar class of patriots they are.

Mr. BUTLER. There was no protection to the Government about the cost, and that is why I offered the amendment this morning to try to make it absolutely clear that the Government would be protected under our contract.

Mr. MILLER. And your amendment was very lucid and covered what I would have called, and what I think you, yourself, realize, a rather awkward clause in the contract.

Mr. BUTLER. Yes.

Mr. MILLER. It was very clearly the intention of Congress, as I get it, although the legislation was passed when I was not a member of this committee, that some such policy as you have outlined here should be carried out; that is, some sort of an operating company was clearly in the congressional mind when this legislation originally passed.

Mr. BUTLER. Yes; I have so understood.

Mr. MILLER. And you are undertaking now——

Mr. BUTLER (interposing). Yes; we are offering to form a company to carry out the declared purpose in the national defense act.

Mr. MILLER. As distinguished from the offer of the Alabama Power Co., which was exclusively a power proposition, your offer is in the nature of an operating company.

Mr. BUTLER. Yes.

Mr. MILLER. To carry out the peace-time purposes and also to stand by for war emergencies.

Mr. BUTLER. Exactly.

Mr. MILLER. Senator, now, let us see just a moment, what kind of proposition we can outline to our colleagues on the floor of the House. In the first place, this proposition of yours will require a complete Congressional reversal of what was its policy last year. You then take hold of the completed plant as an operating company and there is possibly a bond for the faithful performance of your duties.

Mr. BUTLER. Yes.

Mr. MILLER. I do not suppose the bond would guarantee that your proposition would be a financial success.

Mr. BUTLER. It would bind us to do what we agree to do, and the Government would get a certain income or rental regardless of what we got. That much of it the bond would cover, because that is definite and specific.

Mr. MILLER. And, as you said to Mr. McKenzie, your corporation now is with empty pockets. It has no operating fund to commence to operate this plant. You are hopeful, however, under economical and good business management, to make the surplus power establish a fund for the operation of your plant.

Mr. BUTLER. Yes; but pockets not entirely empty.

Mr. MILLER. Operate it under the steam power until your hydroelectric power comes into production.

Mr. BUTLER. Yes; but we are not entirely without means, and our company will have a sufficient capital for an operating company.

Mr. MILLER. And your plan is further, aside from calling upon the Government to complete this dam at Government expense, which will be in the neighborhood of \$32,000,000, is it not, Mr. Chairman?

The CHAIRMAN. No; the Government said \$25,000,000.

Mr. MILLER. \$50,000,000 for both dams.

Mr. BUTLER. From \$22,000,000 to \$27,000,000 have been the various figures submitted before the committee to complete Dam No. 2.

The CHAIRMAN. Of course, Mr. Ford's people proposed to complete both dams for \$42,300,000. The Government engineers first agreed that the amount would be \$28,000,000 apiece or \$56,000,000, but when prices began to fall, they finally said that both dams could be completed for \$50,000,000.

Mr. MILLER. And then again they gave us figures of \$32,000,000 and \$19,000,000 at some place in the hearings. You provide then that the Government shall also expend approximately \$7,000,000 for the rearrangement of these nitrate plants.

Mr. BUTLER. Yes.

Mr. MILLER. Then that would call upon the Congress for \$7,000,000 more in addition to what it would take to complete the dam.

Mr. BUTLER. Yes.

Mr. MILLER. Now, by the expenditure of these respective sums on the reconstruction of these nitrate plants, it would be your idea to follow out the complete Haber formula of construction in nitrate plant No. 1?

Mr. BUTLER. Yes; we know how to do it. We can make it a going concern and a successful one. We can make it the best Haber-process plant in the world.

Mr. MILLER. And its product is the direct synthetic ammonia.

Mr. BUTLER. Yes.

Mr. MILLER. Do I understand that it is your plan to reconstruct nitrate plants so as to use the arc system?

Mr. BUTLER. We will much improve the Haber process with a new catalyst and with an electrolytic cell and the liquid air method as soon as we have power from Dam No. 2.

Mr. MILLER. Or to leave nitrate plants under the cyanamid process.

Mr. BUTLER. Plant No. 2 is a perfect plant for making nitrates for explosives, ammonium nitrates, and we would not interfere with that plant at all, except to add a sulphuric acid unit.

Mr. MILLER. You would go part way with the plant as it is now.

Mr. BUTLER. The processes are exactly the same down to a certain point, until the last step where you use either sulphuric acid or nitrate acid in treating the ammonia. We would put in the machinery and the unit necessary to take up the process at that point and make the nitrates for fertilizers, leaving the remainder of it just as it is, ready at any minute to make nitrates for explosives for war purposes.

Mr. MILLER. Now, you spoke of the electric arc process originally.

Mr. BUTLER. You mean the Haber process?

Mr. MILLER. The electric arc is not the Haber process.

Mr. BUTLER. The electric process to which I referred is an electrolytic cell for taking the hydrogen from the water. This with the liquid air method and the new catalyst with all the improvements on the Haber process. I am not sure that I understand your question.

The CHAIRMAN. I think the arc process has been referred to before this committee as the French process.

Mr. MILLER. I am frank to say that there is a nitrogen products company for manufacturing nitric acid by the electric-arc process in my State, and it is the only factory of the kind in the United States, but its product is direct nitric acid as distinguished from ammonium nitrate or anything of that kind. They simply get the nitrogen out of the air and the hydrogen out of the water.

Mr. BUTLER. Yes.

Mr. MILLER. Then the proposition which we would have to lay before our colleagues on the floor of the House would be that the Government is to furnish the money to complete the dam, furnish the money for the reconstruction of these two nitrate plants, and then to lease it to your company for its operation.

Mr. BUTLER. Yes. But the consideration being the rental offered and the beneficial results to agriculture and the general public.

Mr. MILLER. Under the terms and conditions specified in your offer here?

Mr. BUTLER. Exactly.

Mr. MILLER. I think that is all.

Mr. BUTLER. Please pardon me to say, Mr. Miller, that I am sure that you did not intend to put us in a false position, and Mr. McKenzie, I think, used the same words also, that we "come empty handed to the Government." Well, we are not coming to buy something or to take title from the Government. If we were, we would pay for it.

Mr. MILLER. I did not mean that expression, "empty handed" in an offensive way, Senator. I mean to say that your company is not organized and has no working capital.

Mr. BUTLER. We are business men enough to know that we are going to give a bond to carry out this contract, and that until we make something from it, we are going to have to carry it out at our own expense. We will be able to do that.

Mr. MILLER. That is the interesting part of it and that will offset what I may have intimated by saying "empty pockets." What working fund has your company that we can assure our colleagues on the floor of the House will be put in as showing the financial basis of this operating company?

Mr. BUTLER. We are going to give a bond to spend whatever is necessary to become an operating concern.

Mr. MILLER. The bond is for the faithful performance of your duty and not the financial responsibility of your concern.

Mr. BUTLER. We will specify in the bond everything that we agree to do in this proposal. We specify the time when we will begin to operate one nitrate plant, and when we will operate both. We have got to begin to make nitrates and we will have to furnish the money if we have not made a profit sufficient on the sale of power. Now, just how long and just how much we will have to finance it, we do not know, but we know we are in a position to take care of it, whatever it may be. We are not offering to do something which requires very large capital from us, but offering a service; offering to perform a function that the Government has declared it wants performed, and we are offering it as reliable, responsible, respectable citizens to be backed by such a bond as the Government will ask to carry out in good faith this Government's purpose, as set out in our proposal.

Mr. MILLER. There is no doubt about the responsibility of the citizens and about their good faith.

Mr. BUTLER. Yes.

Mr. MILLER. But you know that in dealings with people and with institutions, the first inquiry usually is, and you and I have experienced it as men, the responsibility of the company you are doing business with.

Mr. BUTLER. Yes.

Mr. MILLER. That is one of the first things asked, and doubtless will be asked by our colleagues on the floor of the House, and what I was getting at was what responsibility this company has. Now, you say its responsibility will be underwritten by a bond. I have never myself seen that method car-

ried out, and I am wondering how it can be done. I have had a good deal to do, as we all have, with almost all kinds of surety undertakings, but I have never seen a bond that was given guaranteeing the financial success of an institution. If there is no guaranty of the financial success of the institution, and the institution itself is not organized and we have no conception of its financial responsibility, you can see in what an impotent position we are in to explain to our colleagues on the floor of the House the technique of this offer.

Mr. BUTLER. Frankly, we have gone on the assumption that the bond would answer those questions. We have not as yet discussed among ourselves just what capital we would put into the company or how much we would need to reach the point when this will be a self-operating proposition, except in a general way. Of course, if our proposition appeals, outside of that, we will put our heads together and meet that situation. We can and we will do it to the satisfaction of the committee.

Mr. MILLER. I will say this, that no offer has ever been made nor has any suggestion ever been made to the Congress along the lines of your offer.

Mr. BUTLER. It is because we have proposed to render a great public purpose which needs a subsidy, and we have worked out a way to make this project subsidize itself. We have also worked out a profit for ourselves and for the Government, and we do not come to you either as paupers or as philanthropists.

Mr. MILLER. I understand that.

Mr. BUTLER. We come to you with a business proposition. We are wonderfully interested, as you are, in what can be done. It appeals to the imagination. It would appeal to us as citizens, but we are trying to make a sound business proposition to do what we conceive to be the Government's purpose and a great public service, and to do it at a reasonable charge for that service. Somebody must render this service and somebody ought to get a reasonable compensation.

Mr. MILLER. But you will appreciate this angle of it. Senator: The Government will have to invest something over \$30,000,000.

Mr. BUTLER. Yes.

Mr. MILLER. And it ties itself up with your enterprise if we accept your offer, and the very first thing that any sound business man would ask about a proposition based upon such a substantial appropriation would be the responsibility of the contracting party, and that is the first thing that every Member of the Congress will ask. What about the responsibility of this party to whom we are leasing this very, very valuable property?

Mr. BUTLER. We had not gotten ready to announce the organization of our company. We all know that when we go into a business enterprise we talk the matter over and have our negotiations, etc., and announce it when we get to a certain point. There are several reasons why we have not yet completed the organization. But Mr. Engstrum, who signs this proposition, is alone financially responsible for all the capital that we will need until we will become an operating concern. He is a man of means and has been successful in what he has done. Mr. Engstrum does not pay \$75,000,000 of income tax, but he pays a very big one.

Mr. MILLER. Doubtless Mr. Engstrum is able and his associates are able, amply able, to organize a company that is amply able to satisfy the Congress of its financial responsibility.

Mr. BUTLER. There is no trouble about doing that.

Mr. MILLER. If that was done, and we could impart that assurance to our colleagues on the floor of the House, that we are dealing here with an institution that had \$1,000,000 or \$1,500,000 or \$5,000,000 of paid-up capital, and they had enough faith to put up their money, then we could say, "Now, Mr. Congress, you go ahead and carry out the original intention as expressed in this act and lease it to this company and we then will operate it according to our contract." It was something of that character, Senator, that I had in mind.

Mr. BUTLER. Mr. Miller, we will endeavor to meet that suggestion.

Mr. MILLER. I just make those suggestions because I know something of the temper of our colleagues on the floor of the House.

Mr. BUTLER. Yes.

Mr. WURZBACH. Senator, at the present time Mr. Engstrum, who makes this offer, is the only man that is dealing with the Government.

Mr. BUTLER. Yes.

Mr. WURZBACH. But it is contemplated later to organize a corporation to take this over?

Mr. BUTLER. Yes.

Mr. WURZBACH. What assets would the proposed company have upon which to incorporate, outside of the prospective profits that would accrue from this contract?

Mr. BUTLER. I tried to answer that in response to Mr. Miller's question.

Mr. WURZBACH. I understood your answer but I was just wondering how you could organize a corporation and how you could get your charter, and if you got your charter, how you could sell stock, unless the corporation had either tangible property or had valuable rights upon which stock could be based.

Mr. BUTLER. Of course, we can form a corporation and have its capital stock paid into the treasury, if necessary.

Mr. WURZBACH. But unless there was some use for the money that would be paid into the corporation.

Mr. BUTLER. It will simply be to meet any expense until we get to operating, because the plant will be self-sustaining, as we figure it, from the time we begin to operate. Of course, the profits will increase when we have the dams built and have the hydroelectric power.

Mr. WURZBACH. Have you any reasonable assurance, Senator, that men would take stock in that kind of a corporation, paying in cash without having assurance of a return; that is, just to pay the cash into the Treasury without any contemplated use for the money that they are paying in, because you do not need any considerable amount of money because the Government is advancing all the money to make these improvements. I was just wondering what you would do with the money that was paid into the treasury of the corporation and whether men would be willing to go into that kind of a proposition.

Mr. BUTLER. We will not need a large capitalization; it might be more practicable for the personnel of the company to become personally responsible in addition to the bond, and that might answer the question, and be better than putting up a lot of idle money.

Mr. WURZBACH. I think it would amount to that in the end.

Mr. BUTLER. It would amount to that in the end, and that would settle the question.

Mr. WURZBACH. Now, I should like to ask you one more question—

Mr. BUTLER (interposing). And that is a matter we will consider.

Mr. WURZBACH. I want to ask you just one question along a different line: I understand you are not only a practical farmer but also a scientific farmer and have made some study in the matter of soil conservation.

Mr. BUTLER. I have had much experience, and I have given the whole question much study.

Mr. WURZBACH. I have heard a great deal during the hearings about the impoverishment of the soil due to a lack or scarcity of commercial fertilizer. Now, is it not a fact, Senator, that the main cause of the poverty of the soil on land that has been cultivated for a considerable number of years is due to the lack of humus in the soil?

Mr. BUTLER. Yes; but you have got to have a certain state of fertility to be able to get the humus in the soil. You have to use a commercial fertilizer. For instance, you can not grow even soya beans, which is a leguminous plant, without some commercial fertilizer to begin with. All leguminous plants will take nitrogen from the air and manufacture it and put it into nodules on the roots, and then if you turn it under, when it rots, it gives you a humus. Every time you do that you have gotten another step up to increasing the condition of your soil for holding fertilizers so that it will produce successfully. Every step builds up. You can not begin successfully without commercial fertilizer, and it is wise to supplement the turning under of these green crops like peas and soya beans with commercial fertilizers. In fact, any successful farmer is planting and turning under these leguminous plants all the time, but then he supplements that with commercial fertilizers, for then the fertilizers will pay best.

Mr. WURZBACH. There is a temptation, is there not, Senator, on the part of some farmers to depend too much on commercial fertilizer?

Mr. BUTLER. Oh, yes; unfortunately, with our rack-rent system in the South, especially, it is terrific, because it is so difficult to get a tenant to be willing to plant any crop except a money crop. To plant a crop that is going to be turned back into the soil means that he must be interested in that farm

enough to stay there for years and have a long lease; everybody who is on a rack-rent system ought to go to a long-lease system and improve the class of their tenants as quickly as possible. There is great depletion of the soil from planting just money crops like tobacco and cotton.

Mr. WUEZBACH. And unless the importance of turning plant life back into the soil is kept in mind, or if we depend too much on commercial fertilizers, the extensive use and the increased use of such commercial fertilizers would do more harm than good in the end, would they not?

Mr. BUTLER. Of course, you are depleting your soil if you do not add humus and use only commercial fertilizer and less than the plant needs. A plant only partially stimulated by fertilizer becomes a leach on the soil. Of course, every year there is a little decomposition of soil material that will produce a little plant food anyhow, but if you stint your commercial fertilizer, the plant after drawing up all the plant food from the commercial fertilizer you have put in, draws anything else from the soil and leaves it thoroughly exhausted. Of course, that is what you have in mind, and that is the way land gets poorer. It is not the fertilizer that makes it poorer, but it is the plant life seeking some more food besides what you have put in. That is what makes it poorer. You can continue to make some sort of a crop on any soil as long as there is a particle of plant food left. You can not make it so poor that you can not make it produce by adding enough fertilizer, but the valuable way of using commercial fertilizer, and the way to produce the best results is to turn under this plant food so that a certain amount of commercial fertilizers will produce twice as large a crop with that humus in there as it would if you did not have it there. There is the key to the whole business, and those of us who can control our tenants do that. I will not have a tenant who does not plant these leguminous plants every year and turn them under.

Mr. WUEZBACH. I understood you were posted on those matters and I thought it would be proper to get this information in the record.

Mr. FIELDS. Senator, you are acting upon the principle or holding to the theory that the production of plant food at Muscle Shoals should be given first consideration and anything else is secondary to that.

Mr. BUTLER. During peace times.

Mr. FIELDS. I was speaking of peace times.

Mr. BUTLER. But I think we should also have in mind keeping these plants available in times of war.

Mr. FIELDS. My question would have covered both angles of the proposition if I had said nitrogen instead of plant food.

Mr. BUTLER. Yes; we need more plant food. There is great need for it. We will soon be without any Chilean nitrates.

Mr. FIELDS. What duty are we paying on Chilean nitrates?

Mr. BUTLER. \$11 a ton, I think, is the export duty which we pay as a bounty to the Chilean people. That is a tax on our farmers amounting to \$11 a ton, and it is a frightful tax.

Mr. FIELDS. What is the present cost of the Chilean nitrates to the fertilizer industry of the country.

Mr. BUTLER. It has been fluctuating very much in price. I should say that it is now something like \$48 or \$50 a ton. Of course, during the war it was over \$100. It was \$85 a ton a little while ago; I have bought it all the way from \$45 to \$110. I think it is now \$48 or \$50. It fluctuates all the time and really fluctuates without any cause whatever. It can be put up or down because it is a monopoly.

Mr. FIELDS. At any rate, the price is now somewhere around \$40 a ton, and practically one-fourth of that is a duty paid to the Chilean Government.

Mr. BUTLER. Yes. I have known it to go up in price without any apparent cause \$5 or \$10 in a week. It is an arbitrary figure. I think they figure how much we can pay for it and still live and keep buying it. It is a question of what the traffic will bear. That is all there is to it. We are just held up.

Mr. FIELDS. The question of your proposed bond has been discussed. Have you discussed with the Secretary of War the amount or character of bond that he would require or the amount of bond that he feels should be required in the case of a contract, such as you are now proposing?

Mr. BUTLER. Yes; we had two hearings with him on this proposal. He noted and made comment on the fact that we had agreed to give a bond satisfactory to the Government. And, furthermore, that no matter how much capital we had or how wealthy we were, it was the proper thing to require a

bond. We will not object to any kind of bond required; it can not be too technical or strict for us, because we can carry out what we agree to do.

Mr. FIELDS. After discussing the matter with the bonding companies you determined that you could meet any requirements?

Mr. BUTLER. Yes.

Mr. FIELDS. If I have followed you correctly, your income in this proposition is to be derived from three sources: First, from the sale of power; and second, from the sale of the products; and, then, from your cost-plus fee on the construction?

Mr. BUTLER. The fee is limited to the period of construction; under the lease our income is derived entirely from the sale of power after paying the Government a rental of 1 mill per kilowatt hour on all power sold.

Mr. FIELDS. As I understand you, it is immaterial to you whether or not the Government employs you under that method to complete the construction or completes the construction itself?

Mr. BUTLER. Exactly. But we are interested, if we are to have the plant, that the construction work shall be first class in every respect. We have made a special point on that, because we want the highest kind of construction, the most durable construction possible, and we will probably be more insistent on that particular point than the Government itself.

Mr. FIELDS. You would be insistent on that point whether the work was done by you or by the Government?

Mr. BUTLER. Yes.

Mr. FIELDS. Eliminating the fee for construction, you have two other sources of income from this proposition. Let us take up the first one, the income from the sale of power. Have you made an estimate as to what your income would be on the sale, say, of 100,000 horsepower per annum, what would accrue to the Government and how much to yourselves?

Mr. BUTLER. We have not been able to do that with any more accuracy than this committee has been able to determine from the testimony, for instance, which I heard yesterday and the day before from some gentlemen that are in the business, as to what they expect to sell their power for. We know generally what power is being sold for, to the different kinds of industries; we have had to figure on what we think we can sell this power for as a minimum, and we will have for our customer these companies that are now distributing it. We are wholesalers of power.

Mr. FIELDS. There is no other information upon which you could figure at this time?

Mr. BUTLER. Certainly not; there was no other way in which to draw this proposal with that kind of information. We think we can come out whole on it, after paying a decent and liberal rental to the Government. We have done the best we could.

Mr. FIELDS. I realize most thoroughly, Senator, the disadvantage at which you were placed in estimating in order to make a calculation of that character.

Mr. BUTLER. It has been very difficult to do it.

Mr. FIELDS. From such estimates as you were able to make, about what amount do you figure would go to the Government on the sale of 100,000 horsepower, and about what per cent would go to your company? I wish you would tell us that so we will have some knowledge as to what per cent of the income would go to you and what per cent to the Government.

Mr. BUTLER. Let us suppose that we sell power for a mill and a half per kilowatt hour, which is one figure named by the Alabama Power Co. on yesterday; the Government gets 1 mill and we would get the remaining half mill. There you are. It is just a question of what you can sell the power for. In that case the Government gets \$2 for every \$1. We get—

Mr. FIELDS. By the terms of your contract the Government gets 1 mill?

Mr. BUTLER. Absolutely. If we do not sell it for more than 1 mill, the Government gets all of it, but under the provisions of our bond we have to go ahead, without any profit on it at all.

Mr. FIELDS. What you get above 1 mill—

Mr. BUTLER (interposing). Is our profit. We state in one of the paragraphs of the contract that our compensation shall come entirely from that source.

Mr. FIELDS. And on the price fixed by the Alabama Power Co., or on that figure that we would regard as the price, from the testimony of the president

of the Alabama Power Co., you would make your calculation at 1 mill to the Government and $\frac{1}{2}$ mill to yourselves?

Mr. BUTLER. On one estimate he made yesterday. I hoped that we would do better than that, and I must say I was not very comfortable to hear him figuring that way. The sale depends very largely upon the bids which will come from the other companies around there, in bidding against each other. In fact, when there is the greater demand for the power it will be bid up, and as the development of the country increases, and the sale of power increases, of course, the money profit will go up. The power companies will soon be bidding against each other for the power that we are producing. They will want to deal with us, and they will be bidding against each other, and so we will be in an advantageous position.

Mr. FIELDS. You can not suffer by reason of the competition among the other companies?

Mr. BUTLER. No; we will profit by it—and the whole country around will profit by it. Some of this power should be sold to the people and the industries in a circle around Muscle Shoals. So we expect to wholesale this power to those who most need it.

Mr. FIELDS. Roughly speaking, about what percentage of the power would you figure you would put into the production of nitrates and what percentage would you market?

Mr. BUTLER. No one can tell until we finished them just exactly the number of kilowatts it would require to keep them going, but we estimate anywhere from 75,000 to 100,000 kilowatts, and the rest of it would be for sale. But how much we can sell, and at what price, is yet to be determined.

Then another thing; we would have to run the steam plants for at least 15 or 20 per cent of each year in order to have much power to sell, after running both nitrate plants. If we have contracted to sell power at a certain price we may, in some years, have to run the steam plant longer than in other years, and that, of course, would cut down our profit.

Mr. FIELDS. With dam No. 2 completed and supplemented during low water periods by the steam plants, what do you figure you could make from the maximum production of power there?

Mr. BUTLER. It is possible to make 440,000 kilowatts if we were to run all the steam power to supplement the water power to its full capacity, except during flood water. We can produce the 440,000 kilowatts for every day in the year, if it will pay. But you can understand that we will reach a point when it will not be profitable to run the steam plants.

Mr. FIELDS. When you supply the market you have to quit?

Mr. BUTLER. Exactly. When we reach the point when it does not pay, we have to stop. It depends. If it would pay, we could make 440,000 kilowatts every day in the year.

Mr. FIELDS. What percentage of the 440,000 kilowatts would be required to operate the two nitrate plants?

Mr. BUTLER. From 75,000 to 100,000, is the estimate.

Mr. FIELDS. Your next source of income is from the sale of your product. Will you explain briefly—and you may have explained it already, but I did not get it very clearly in my mind—just how you figure out the Government is going to have an advantage on that proposition?

Mr. BUTLER. It is this way: How to protect the public from having the products going into the hands of a trust after the Government spends its money, was one of the difficulties we had to face. So, finally, we provided that the nitrates shall be sold at a price subject to the approval of the Secretary of Agriculture.

Mr. FIELDS. You were willing to leave the amount of your profit to the decision of the Secretary of Agriculture?

Mr. BUTLER. No; our profit comes from the sale of power not needed to run the nitrate plants, and the 1 mill per kilowatt hour to be paid to the Government is to be first used to finance the making of nitrates as long as they are made at a loss. Now if the selling price of nitrates is fixed too low, we will not be able to finance the maximum output of the plants. We would be forced to run on short time. This is a serious phase of the matter.

Mr. FIELDS. Instead of fixing a maximum profit that you shall not exceed, you leave the matter open and in the hands of the Secretary of Agriculture?

Mr. BUTLER. Yes, sir; just leave it right open, except that we are to make no profit on nitrates. I will tell you how it will work. We have provided that we are going to make all of the nitrates that can be made, and that the

money that comes from the sale of this power is to be used, if necessary, to the extent of 1 mill per kilowatt hour, in financing any loss on the sale of nitrates. Therefore, if the Secretary was to fix the price so low as to exhaust this financing fund, then we would have to stop when it was exhausted. To this extent we will be affected by the price which the Secretary of Agriculture may fix.

Mr. QUIN. Senator Butler, this proposition, from my analysis, appears to be twofold. This supposed corporation and lessee named by Mr. Engstrum is to be in the position of a contractor doing construction work and finishing the dam and changing the plants, first. After that is done and the Government expends that profit of 5 per cent, which it gives to the contractor—

Mr. BUTLER (interposing). Not a profit; that is to cover the overhead charges.

Mr. QUIN. The Government is bound to pay this 5 per cent above the actual cost of the work.

Mr. BUTLER. The Government pays in all, simply 5 per cent above what the lowest bidder bids to do each piece of work for.

Mr. QUIN. That is not the way I understand it.

Mr. BUTLER. If he bids to do it; we will say, for \$100, and he carries out his contract and the work is done, the Government pays in all only \$105. That is all there is to it.

Mr. QUIN. The other function of this lessee would be to operate the nitrate plants as stated in here.

Mr. BUTLER. Yes.

Mr. QUIN. And to dispose of all the power generated either by the hydroelectric method or by the steam plant. That is what I understand the function of this lessee would be.

Now, it is not disclosed here who this lessee is. You have been a Member of the United States Senate, and you know the responsibility which is upon this committee. Suppose this committee were to report to the House that the proposition of Mr. Engstrum be accepted. Do you not think that the first question that would be asked by the Members of the House and interested people in the United States would be: Who is Engstrum, and who is the unnamed, unchartered corporation that is the lessee? That is the natural inference, is it not?

Mr. BUTLER. Yes.

Mr. QUIN. We could not answer that question. There is not in this proposition a single line that would bind Mr. Engstrum, and this unchartered, unknown corporation, named as the lessee of course, could not be bound. In order to bind it it would have to have a domicile and a sufficient capitalization. Then we would be gone there. Do you not think you ought to disclose to this committee who these organizers will be and something about the amount that the capital of such a lessee corporation may be, in order that this committee may make any kind of an intelligent report?

Mr. BUTLER. We have agreed to meet that point.

Mr. QUIN. You admit that it is simply a matter of dealing up in the air as to that proposition, as to who make up this corporation, and what its financial responsibility is.

Mr. BUTLER. I again make the same answer.

Mr. QUIN. You can readily see, Senator, as a lawyer, that if this proposition were accepted by the Congress and passed, there is nothing to bind anybody and no financial damage would result to anybody, and if Mr. Engstrum were in the rôle of a speculator looking to somebody to finance this proposition, or to form a corporation to go into it, and he failed, then under the law he would not be liable for a dollar, and this unknown institution could not be.

Mr. BUTLER. I see your point and realize its force. That is the same point, however, that has been raised before several times, and my answer is the same as before.

Mr. QUIN. I take it you must be a pretty big business man to be able to conduct this big farm you have through all these years and not go broke.

Mr. BUTLER. I admit that it has put some grey hairs in my head, to be able to run that farm and not go broke; and I agree that it requires considerable business capacity, because I have been able to succeed at everything else I have undertaken much better than I have been able to succeed at that.

Mr. WRIGHT. I do not know that I understand yet just the terms of this proposition, as to what the lessee will derive from the lease and what the Government will get.

Mr. BUTLER. First we will use enough power to serve both nitrate plants, and then we will sell the remainder.

We will devote 1 mill per kilowatt hour and put it in a trust fund, if you please, for that is what it amounts to, to be used in financing the making of these nitrates now, because you can not make them at a profit now, and we want to begin selling it at once even at a loss. Somebody has to pay for the difference until we can make them at a profit, and then we will turn the whole sum into the Treasury; and, afterwards if we make fertilizer at a profit, the profit on the fertilizer goes into the Treasury along with 1 mill. We did not attempt to figure the income to the Government or what the return from the fertilizer would be because that can not now be determined. But everybody can see that if we were to run along and finally make fertilizer at a profit of \$5 a ton or more, that under this provision, the revenue from that fertilizer and the 1 mill per kilowatt hour will all go into the Treasury, because we provide specifically that we do not take any profit from the fertilizer. Our profit will come entirely from what we may be able to sell power at over the 1 mill per kilowatt hour.

Mr. WRIGHT. As I understand the general proposition is that the lessee will be carrying out the purposes and intentions of the Government as originally expressed in the national defense act, instead of the Government doing that itself as a Government.

Mr. BUTLER. Yes.

Mr. WRIGHT. It would be doing it through the lessee, and you propose that this company shall be the lessee.

Mr. BUTLER. Yes.

Mr. WRIGHT. That being done under the terms of this proposition would not the whole thing be a venture so far as any profit to the lessee or any dollars going into the Treasury of the Government would be concerned? It would depend altogether, would it not, on the success of the venture?

Mr. BUTLER. There is no possible chance for us to fail under this proposal. We will use only a part of the power to run both nitrate plants; the remainder of the power we will sell; 1 mill per kilowatt hour of that sum goes to the Government and all we get above that goes to us. How can anybody fail at that? Now, as long as we have to make nitrates at a loss, then the 1 mill will be used to finance such loss.

Mr. WRIGHT. Do you not propose to devote the entire income from the water-power to the production of fertilizer?

Mr. BUTLER. No; we propose to devote 1 mill per kilowatt hour, and anything that we can sell power for in excess of that is our compensation for acting as the lessee of the Government carrying out its purpose.

Mr. WRIGHT. So that part the waterpower may produce will be limited to 1 mill per kilowatt, in so far as aiding the production of fertilizer is concerned.

Mr. BUTLER. We use all the power needed to run the two plants, but 1 mill per kilowatt is used to finance any loss on the fertilizer. Suppose the Secretary of Agriculture says sell it for \$10 a ton less, because of the export bonus on the Chilean nitrate. We would have 1 mill per kilowatt hour to finance that loss. When we are a going concern, it finances itself; we have worked out a scheme to do it, to make the fertilizer at a profit sooner or later. We will not be able to make the fertilizer by this process at a profit now unless we called on Congress to subsidize the loss. So I felt that we had to work out a scheme under which this power would finance this proposition.

Mr. WRIGHT. It is not really contemplated that the Government would make a profit out of this enterprise, unless 1 mill per kilowatt hour was not utilized or required to go into the production of fertilizer.

Mr. BUTLER. If it is not required for this purpose, then it goes directly into the treasury.

Mr. WRIGHT. If it is required for the fertilizer the Government would not get anything.

Mr. BUTLER. If the Government wants to make nitrates for the farmers regardless of cost, then we say the only way you can do it is either by using this money from the sale of power for this purpose, or else make an appropriation from which to subsidize the business.

Mr. WRIGHT. From your viewpoint the Government would have this gigantic plant operated to carry out the original purpose, whether it meant any dollars to the Government or not.

Mr. BUTLER. Yes; but with the almost certain prospect of soon doing it at a profit.

Mr. WRIGHT. And the source of the Government's revenue would be derived from this 1 mill per kilowatt hour, that is, if this 1 mill per kilowatt hour was not needed to go into the production of fertilizer it would go into the Treasury of the Government.

Mr. BUTLER. Yes; of course in addition you have that plant there producing nitrates and fertilizers for the benefit of agriculture and also a plant ready for the national defense in time of war; and that is one of the important features of this proposition.

Mr. WRIGHT. It is a very vital element in this proposition.

Mr. BUTLER. It is a very vital element and it is a service which we are rendering. If we reach a time when fertilizer can be sold at a profit then the revenue goes to the Government, too, because we do not take any of the profits that would be made on that; that would go into this trust fund, and it goes along with this 1 mill into the treasury. It is a part of the trust fund for financing this thing. We use that, along with the 1 mill, for operating expenses until we can make a profit, and then the surplus goes into the Treasury, whatever it comes from.

Mr. WRIGHT. Having furnished the power necessary to operate the plants, there may be some doubt about getting the 1 mill per kilowatt hour, and then fertilizer under that plan could not be profitably and economically produced, could it?

Mr. BUTLER. Unless we subsidized it with 1 mill.

Mr. WRIGHT. I am counting that, Senator.

Mr. BUTLER. We can do it from the start from the sale of power.

Mr. WRIGHT. You mean if you get the power to operate the plants from this hydroelectric steam power.

Mr. BUTLER. Yes.

Mr. WRIGHT. That goes into the cost of the production of fertilizer?

Mr. BUTLER. Yes.

Mr. WRIGHT. Then you add this 1 mill per kilowatt hour?

Mr. BUTLER. We know we can sell it for that and more.

Mr. WRIGHT. The question is whether, under those conditions, you are sure you can produce it at such cost that it can be sold at a price at which the American farmer can afford to buy it?

Mr. BUTLER. We will always sell it below the present cost of Chilean nitrates and make up the loss as long as may be necessary from this 1 mill per kilowatt hour, which we will have for this use from the sale of all power. This makes cheap nitrates and cheaper fertilizers sure.

Mr. WRIGHT. You were speaking about the cost of nitrates. I am a small farmer myself. Of course, that cost fluctuates, but the last quotation, I think, was \$65 a ton, retail.

Mr. BUTLER. It has fluctuated much recently.

Mr. WRIGHT. You think there is no doubt that the lessee could produce nitrates there at a very much less price than that to the farmer.

Mr. BUTLER. We can not by the present process, with Chilean nitrates around \$50 a ton, without a subsidy. But our proposal provides to furnish that subsidy from the sale of excess power as long as may be necessary. We expect soon, however, to be able to make nitrates at a cost less than the cost of Chilean nitrates and, indeed, at a profit. Everybody expects this to come from improvements in the Haber process.

Mr. WRIGHT. Have you considered the far-reaching results that might come from the operation of this great plant on the production of fertilizer?

Mr. BUTLER. It is simply staggering.

Mr. WRIGHT. You think it would not only enable the farmer to produce more crops—

Mr. BUTLER (interposing). But cheaper.

Mr. WRIGHT. At cheaper prices than he can afford to sell them for now, and it would likewise lower the cost to the consumer?

Mr. BUTLER. Yes; the benefits will be Nation wide.

Mr. WRIGHT. It is not for the benefit of any particular section?

Mr. BUTLER. It is truly national: it is a tremendous governmental function, reaching to every person in the Nation.

Mr. WRIGHT. Of great national scope?

Mr. BUTLER. It is of such national scope that it is a governmental function.

Mr. WRIGHT. It almost reaches into world-wide scope?

Mr. BUTLER. Yes; to an extent.

Mr. STOLL. You stated, this morning, that you are one of five directors of this proposed company?

Mr. BUTLER. Yes.

Mr. STOLL. Who are the other four directors?

Mr. BUTLER. Mr. Engstrum will be one. We have not asked the permission of our associates to announce the full directorate. There would be three others. Two would be named by the Government and the other three by the company—there will be 7 in all.

Mr. STOLL. Is Mr. Duke to be connected with it?

Mr. BUTLER. Not unless some arrangements are made from now on. There is no understanding with him now, direct or indirect, in regard to the matter.

Mr. STOLL. Is the Virginia-Carolina Chemical Co. to be connected with it?

Mr. BUTLER. No. In regard to Mr. Duke, I say to you frankly, I do not want to be put in the position of saying that I am glad that he is not connected with the company, because I have respect for him as a business man; but I have made no effort to be associated with him and he has made no effort to be associated with us, and he is not associated with Mr. Engstrum or myself; there has never been any communication between us about this matter directly or indirectly.

Mr. STOLL. Now, Mr. Engstrum is a contractor—that is his business?

Mr. BUTLER. Yes; and an engineer.

Mr. STOLL. I believe you stated that the 5 per cent, that you provide for in section 19, is the usual contract price; that is, the average?

Mr. BUTLER. That is the minimum. The usual fee for an engineer is 10 per cent.

Mr. STOLL. Well, he is an engineer.

Mr. BUTLER. Yes.

Mr. STOLL. Did you not state that is the usual price?

Mr. BUTLER. That is the usual engineer's minimum price.

Mr. STOLL. Mr. Engstrum is an engineer. Would it not be a good proposition for Mr. Engstrum if he could get this work completed, on which there would be an expenditure of something like twenty or twenty-five million dollars with a fee of 5 per cent? Would that not be a good proposition for him to get that job, even if none of the other part of the thing was ever carried through.

Mr. BUTLER. I say frankly that we are interested less in the construction than we are in the lease.

Mr. STOLL. I did not ask you that.

Mr. BUTLER. We have figured on the construction as well as the operation and on what we considered a fair business basis.

Mr. STOLL. I did not ask you that, Senator. I asked you the direct question. Would it not be a good proposition for Mr. Engstrum, he being an engineer, if he could get the 5 per cent provided for in section 19 on a contract of this size, and then after it was done the other part could go to the bow-wows, and would still have a good proposition?

Mr. BUTLER. He could possibly make some profit out of the construction. He ought to, but he can make more out of the leases, and his bond would require him to operate the whole plant.

Mr. STOLL. If that is the usual engineer's fee, it must be a good proposition.

Mr. BUTLER. Yes; but I say to you frankly that in our figuring out this whole proposition, the part of it on which we expect to make the most, and the part that has appealed to us is the operation of the lease. Of course, we do not expect to lose any money; we expect to make a fair business profit on the whole proposition.

Mr. STOLL. But the fact remains that Mr. Engstrum's business is that of an engineer and constructor.

Mr. BUTLER. If he was not responsible and could not give a bond, he could not get any important contracts.

Mr. STOLL. That is his business, and it would be a good business proposition in that particular.

Mr. BUTLER. Not as good as some that he has had, or as the lease under this proposal.

Mr. STOLL. One million two hundred and fifty thousand dollars sounds pretty good for two or three years' work.

Mr. BUTLER. He has been doing better than that. But then let the Government go ahead and finish the dam. If the Government will finish that dam, then we are ready to lease and operate the plant under the terms of this proposal.

Mr. STOLL. I want to direct your attention to section 15 which says: "It is agreed that the lessee will not be required to invest in the manufacture of nitrates or other fertilizer compounds, other than that received from the sale of the products of nitrate plants plus 1 mill per kilowatt hour received from the sale of power in excess of that required to operate the plant."

Under this agreement you can not be required and it is understood that you are not going to put 1 cent of money into it. That much is understood.

Mr. BUTLER. It has to be a going concern and we agree to begin work within 60 days, and we give a bond to cover that.

Mr. STOLL. It says you are not to put anything into it except what you get from that.

Mr. BUTLER. We are not called upon to spend our money to complete Government property. We offer to finish it or let the Government finish it, and then to lease and operate, giving a greater rental than anyone else has offered. I said to Mr. Engstrom when he wrote that. "Why do you put that in?" He said, "I did not want to appear to be giving something; this is a plain business proposition; there is no philanthropy in it."

Mr. STOLL. That is a definite statement there that you are not going to put any money in it except what you are going to get out of it after it has been put in operation. I want to call your attention to section 18, which reads as follows: "It is also further agreed that when nitrates can be made at a profit or when the cost of the same has been so reduced that the funds so arising from excess power and fertilizer compounds are not needed in whole or in part for financing such productions as herein provided, the said funds shall be paid by the lessee into the Treasury of the United States."

What do you mean by that? I do not exactly catch the significance of that.

Mr. BUTLER. We propose to finance the making of nitrates while we make them at a loss, and we will do that out of the proceeds of the sale of power not necessary to run the nitrate plants; that is, we will use one mill per kilowatt hour of power we sell to cover any deficit. When that time passes we will pay the whole sum into the Treasury.

Mr. STOLL. How in the world can you do that when you have already stated that you are not going to invest one cent in the manufacture of nitrates or compounds as set forth in section 15. Are not those two sections contradictory?

Mr. BUTLER. No; because we will begin selling power the very minute we begin to operate, and there will be an income from the power we do not need for the manufacture of nitrate. We will set aside that amount to finance the making of the nitrates as long as we have to make them without profit.

Mr. STOLL. That section contemplates your having had to make them without a profit, because it says "when the nitrates can be made at a profit."

Mr. BUTLER. As soon as we get 1 mill from the power we sell we use that to cover the difference in the cost of the manufacture of nitrates that we are making at a loss, because we are practically subsidizing it out of the power we sell, and this is the source from which we get the funds to finance it.

Mr. STOLL. How can you get away from this, "when the cost of the same has been so reduced that the funds arising from the sale of excess power and fertilizer compounds are not needed in whole or in part for financing such productions as herein provided?" To what extent will it be needed to finance; when will it commence to go into the Treasury of the United States?

Mr. BUTLER. Whenever we can make nitrates and fertilizer without loss, then all of that 1 mill per kilowatt hour goes into the Treasury as rental on the lease.

Mr. STOLL. Where do your profits come from?

Mr. BUTLER. That comes from the sale of the power above the 1 mill.

Mr. STOLL. You give all the profits from this to the Government?

Mr. BUTLER. No and yes. We are financing this whole thing by the sale of power not needed to run the nitrate plants. Whenever we sell a kilowatt hour of power we set aside in a trust fund 1 mill, no matter what we sell it for. We may only sell it for 1 mill, and then the Government would get it all. We may sell it for a mill and a half. One mill is set aside for the Government and we take the balance. We do not take anything from the sale of fertilizer. We put it back into the operation, and we do not use the 1 mill except whenever it is needed to finance the making of nitrates at a loss. It goes into the Treasury. Our books are open to inspection. Whenever we can make fertilizer without a loss, then the 1 mill goes to the United States Treasury.

Mr. STOLL. You do not get any of that.

Mr. BUTLER. We do not get any of the 1 mill. We only get whatever we are able to sell the power for above the 1 mill. What the Government gets is absolutely fixed by the contract; what we get varies according to what we may be able to get for power.

Mr. STOLL. Your profit is in the selling of the power?

Mr. BUTLER. It is in the excess above the 1 mill.

Mr. STOLL. You get no profit from the nitrates or from the fertilizer?

Mr. BUTLER. Absolutely none. The price is subject to the regulation of the Secretary of Agriculture. We hope and believe this plant will in the near future be making nitrates for fertilizer at a profit.

Mr. STOLL. If you can not make fertilizer at a profit—

Mr. BUTLER (interposing). We can not when we begin.

Mr. STOLL. If you never do all the revenue the Government will get will be 1 mill per kilowatt-hour for the sale of the power.

Mr. BUTLER. That will go into the financing of the making of fertilizer as long as it is needed; and then it will go into the Treasury.

Mr. STOLL. That is all the Government would get if the fertilizer was not successful?

Mr. BUTLER. Yes.

Mr. STOLL. If you did not sell very much power the revenue to the Government would be very small?

Mr. BUTLER. Certainly.

Mr. STOLL. Do you not think you would have pretty stiff competition from the Alabama Power Co. in selling power in that section of the country?

Mr. BUTLER. No. The fact is, it will no doubt be one of our best customers. We are not going to be retailing power. We will be wholesalers.

Mr. STOLL. That is purely conjecture on your part; that the Alabama Power Co. is going to take your power.

Mr. BUTLER. Certainly; but somebody will take it.

Mr. STOLL. You have seen Mr. Martin on the stand here, or at least I have, and he is not a man who throws up his hands and quits very easily. He has a great concern down there.

Mr. BUTLER. Yes.

Mr. STOLL. That is their business?

Mr. BUTLER. Yes.

Mr. STOLL. Do you think he will quietly take power from you and not start to fight you?

Mr. BUTLER. How could he fight us, if we are furnishing power to him cheaper than anyone else?

Mr. STOLL. Is he after power to sell?

Mr. BUTLER. He testified here, and I am satisfied it is true, that he has a demand for more than he can furnish.

Mr. STOLL. Mr. Martin is in the power business.

Mr. BUTLER. So are we, but we are wholesalers.

Mr. STOLL. That is all conjecture; you have to develop that business.

Mr. BUTLER. We can sell it if we offer it on better terms than they can make it or get it from some one else. After paying 1 mill to the Government, we figure we can get out whole on the average and have enough to make us safe, and we know that the demand for power will increase.

Mr. STOLL. If the fertilizer proposition proves a failure so far as producing it on an economic basis is concerned and you fail to get a ready market for it and do not get a ready market for your current, the Government will get no revenue whatsoever and your concern will get \$1,250,000 for building this dam on a 5 per cent contract. That is true, is it not?

Mr. BUTLER. If we are going to begin by supposing something which will never happen, then you can end by concluding anything you desire. There is there now a market for 100,000 horsepower, and this will finance the running of both nitrate plants on full time, with nitrates sold at a loss of at least \$5 a ton or more.

Mr. STOLL. I just wanted to see if my idea of your contract was correct.

Mr. BUTLER. We can not start to-morrow making nitrates at a profit, but we can sell enough power to finance the making of it at a loss.

Mr. STOLL. The only thing that is certain is that Mr. Engstrum, who is a contractor and an engineer, and his company will get \$1,250,000 for building this dam, and then if the other proposition proves a failure, that is the fer-

tillizer, and there is no special market for your current, the whole thing falls down and is back on the hands of the Government and you have not invested one cent in it; that is true, is it not?

Mr. BUTLER. But it can not be a failure. We give a bond to run those nitrate plants and we can do it by the sale of power, no matter if the nitrates are sold below cost. The plant finances itself, pays us a profit, and it pays the Government a profit, and it produces cheap nitrates. This is plain, simple, and certain. How much more can anyone want us to do?

Mr. STOLL. Who drew this contract?

Mr. BUTLER. Well, it has been the result of the thoughts of a number of people. There is no one person who drew it. It has been worked over many times. Mr. Engstrum has written some paragraphs and has changed some; I have written some and changed some; and several other people have had a part in it. We have conferred with everybody whom we have been associated with; it is a composite production.

Mr. STOLL. Have you ever been in the electrical business?

Mr. BUTLER. No; not as an expert, but I know much about it.

Mr. STOLL. Has Mr. Engstrum ever been in the electrical business?

Mr. BUTLER. No; he is a contractor and an engineer.

Mr. ENGSTRUM. I have built power plants for the Edison people in southern California, also the industrial plants for the production of potash for the American Trona Potash Corporation.

Mr. STOLL. Those were built according to specifications that had been drawn. He has not been engaged in the marketing and selling under competition of electrical current or engaged in the business of making fertilizer from nitrogen from the air, or any of those things; had no experience in that; you have no experience to offer and you are putting up no money.

That is all, Mr. Chairman.

Mr. CROWTHER. Mr. Fields asked you a question, and I am sure that he did not quite mean it as he stated it, perhaps, and you did not mean to answer to the effect that the tonnage charge on Chilean nitrate was \$11.50, or the export charge. Then he said that in the \$45 a ton there was about 25 per cent charge on fertilizer due entirely to that fact. Of course, he does not mean that, because there is not a ton of Chilean nitrate in a ton of fertilizer.

Mr. FIELDS. I meant 25 per cent of the nitrate in the fertilizer.

Mr. CROWTHER. That has been the idea carried all through these hearings, that about one-quarter of a ton of fertilizer was spent entirely for the Chilean export fee. That is not so, is it?

Mr. BUTLER. No.

Mr. CROWTHER. That is 15 per cent nitrogen, is it not?

Mr. BUTLER. Sixteen per cent is what it ought to be; 16 per cent of nitrogen.

Mr. CROWTHER. If it was very heavy fertilizer, there would be 10 per cent of nitrogen, and if it was only nitrogen it would be \$1.50, would it not?

Mr. BUTLER. The usual formula of fertilizer is to take this Chilean nitrate, which has 16 per cent nitrogen, and put in 3 or 4 per cent of it and about the same of potash and from 8 to 10 per cent of phosphoric acid, and make it up in the usual proportion in a ton of commercial fertilizer. In that ton of commercial fertilizer three-quarters of it is made up of these products and the other is the filler. There is a certain amount of binder or rather holder required. There is about 25 per cent of ammonia in the sulphate of ammonia and the remainder is holder, not filler.

Mr. CROWTHER. That is where a great error has occurred in much of the discussion. The word filler has been used when it should not have been used.

Mr. BUTLER. The filler is only the thing which is finally put in the fertilizer by the fertilizer man to add to the weight. When you have the ammonia ready for mixing there is 25 per cent ammonia and the rest of it is the binder or holder. Then you have the nitrate, of which 16 per cent is nitrogen, and the phosphoric acid which is 16 per cent phosphoric acid, and the rest of it is holder or binder. This makes three-quarters of the ton; then 25 per cent of filler is added to that to make the ton of weight.

Mr. CROWTHER. The statement has been made that there is only 320 pounds of fertilizer to 1,680 pounds of filler.

Mr. BUTLER. That is incorrect. On the average, there is three-quarters of every ton of fertilizer that is plant food in the best form in which we can now make it. We do hope, however, that this development will add to the world's supply, which everybody has been looking forward to, and will at the same time

show us the way to concentrate these ingredients, so that instead of having 100 pounds of sulphate of ammonia of which only 23 per cent is ammonia and the rest of it holder, that we can get a holder that would be half that size; that would be a great improvement. There has been some progress along that line, and when we make nitrates by the Haber process there will be less of the holder than is in the nitrates that come from Chile. We possibly will get to the point where we can combine these three ingredients to make what is now in a ton to equal not more than 350 or 360 pounds.

Mr. CROWTHER. In reference to the question Mr. Stoll asked you, as to your knowledge or Mr. Engstrum's knowledge, you have heard the evidence in the previous hearings. I want to ask you whether there has been any evidence given to the effect that Mr. Ford was ever in the electrical business or sold electric power, or manufactured fertilizer, or knows anything about things of that sort, except in connection with his automobile business. Has there been any evidence presented here showing that he knows any more about these things than your people?

Mr. BUTLER. Certainly not.

Mr. CROWTHER. Mr. Stoll suggests that Mr. Ford has a large sum of money in it, or proposes to put a large sum into it. But he is borrowing money from the Government at 4 per cent, computing it at compound interest against the Government, and paying out an amortization fund.

Mr. BUTLER. I do not claim to be an expert any further than I have told you frankly, from my general knowledge and experience; but I do know this: I know what we can do down there, and if you give us this contract, that we will succeed. I feel so confident about it that I am going to devote the rest of my life to doing it; I do not want any better monument than to do a thing of this kind for the prosperity of agriculturists and for the welfare of our people generally. All this can be done with a proper utilization of that great water power. It appeals to a man's imagination as well as to his sound business sense. It is a great thing to do. It is not a philanthropy, because we expect to make money, and the Government will make money and will get a vast benefit from it. The results you are going to get from this water power depend on what it is going to be used for. You can, of course, have this tremendous power used in a way that would be a great disappointment.

Now, I feel that we should avoid the mistake which has been made with the power at Niagara. It is being used for the development of one kind of business or industry. What has been the result? It was allowed to be monopolized for the development of one special thing, which gives practically no general public benefit or good, and does not give any special benefit to the community around there. To-day everybody in New York is up in arms, and the governor of the State is trying to find some way to get around the great mistake they have made in allowing this water power, which should have been used to serve the general public and not for the benefit of a special private industry.

It would be a great mistake to do that sort of thing here. I have had that in mind in drawing this proposal. We provide for selling a certain amount of power, and it will be sold and distributed to conserve the needs of that surrounding and growing community. If you are ever going to use any one great power at any one place for one thing, then heaven knows that fertilizer is the most justifiable thing for which you could use it—nitrates, both for peace and in war. Such a water power should never be turned over to private use and profit.

This proposition uses a large part of the power in making fertilizer and leaves still a large amount to be sold to the public, not to any one enterprise, not to any one farmer, but to the whole circle of people and industries around. So we are doing two things if we develop it on this line. We get the greatest results for the production of nitrates for preparedness, for peace, and war; we are furnishing an enormous amount of power for sale to the surrounding country that will help every individual and every industry as their needs require.

I have had a kind of glowing feeling of pride and satisfaction that we had been able to work out a proposal which from every angle will serve the public good and will never serve any special or private interest above the public interest. It is to have the opportunity to develop this great property along the lines of this proposal, because we have a real desire to see these beneficent purposes materialized and to help do it.

Mr. Chairman, if we are given this contract we will have the best engineering talent available in this country. Mr. Engstrum is an engineer of a good

deal of experience, but we felt that in a great proposition like this we ought to have the best engineer who could be gotten in the world. We also wanted to get a man whose name and work is known to you, and who would carry confidence. So we have taken this matter up with General Goethals, and have been fortunate enough to secure his services. Of course, we wanted first to get his approval and to know that it appealed to him and we wanted to employ him and have the benefit of his advice if we were given this contract. So we have reached a contract agreement with him to serve as the engineer named. We have provided in this agreement that there shall be an engineer representing our company, and he will serve as our engineer to do the work under this contract. He is not now in New York; he has had a number of engagements on the Pacific coast, but is now on his way east. We hope he can appear before your committee.

The CHAIRMAN. Will he be ready to come here Monday?

Mr. BUTLER. Mr. Engstrum says he has just heard from his office in New York and they tell him General Goethals will not be back until Wednesday or Thursday. If the committee desires to close the hearings before that time, we may desire some one from his office to appear. Of course he has some very able engineers in his office.

The CHAIRMAN. Of course, the committee has been working very hard, and it is the desire of every member of the committee that we get through with these hearings as speedily as possible. We will have to take up the hearings in executive session, and it will probably be a full week before we can agree on a report. It is very desirable that we get through with the hearings. If you can have a representative of General Goethals here on Monday we will hear him.

Mr. BUTLER. We will have a representative of his here on Monday.

The CHAIRMAN. We thank you very much for your candid explanatory statement. It has been very interesting. We will have no meeting to-morrow; we will meet again on Monday morning at 10.30 o'clock.

(Thereupon, at 4.30 o'clock p. m. the committee adjourned to meet Monday, March 6, 1922, at 10.30 o'clock a. m.)

COMMITTEE ON MILITARY AFFAIRS,
HOUSE OF REPRESENTATIVES.
Monday, March 6, 1922.

The committee met at 10.30 o'clock a. m., Hon. Julius Kahn (chairman) presiding.

STATEMENT OF MR. FREDERICK E. ENGSTRUM—Resumed.

The CHAIRMAN. Mr. Engstrum, when we closed on Friday, Senator Butler said that you would be ready to go again this morning. He intimated you would have an engineer here from General Goethals's office in New York. I understand he has not come and therefore you would like to go on with the hearing?

Mr. ENGSTRUM. Yes, Mr. Chairman. I telephoned to our engineers in New York, General Goethals's office, and General Goethals's colleagues or his engineers there did not feel they would like to step in front of the General in this matter because he personally was more familiar with it, having built the old canals down at this point and having been stationed at this point, and being thoroughly familiar with the project, more than any of the other engineers in the office. The General is returning from the coast and will not be back in the New York office until Wednesday night. He could not be here until Thursday. I regret very much we can not have his testimony unless we could have it transcribed and transmitted to the committee as a matter of a letter later on, in case the hearings were closed. We want to give all the information to the committee that we can and do not want to inconvenience the committee or keep them waiting in any respect. For any delay on our part we will have to bear our own responsibility.

I would like to make a short statement, Mr. Chairman, regarding the offer which we presented on Friday. I believe that Senator Butler presented it very clearly. He presented it in almost every particular we had considered before the presentation, and there is very little I can add to his explanation. I would like to say in this respect that we have here two nitrate plants, one

having cost \$13,000,000 and the other \$67,000,000, both of which can be put to work in a high state of efficiency for about \$7,000,000, and the greatest dam in the world, partly constructed at a cost of \$17,000,000, which will soon be worthless unless completed.

Obviously it is economy and good business to finish this dam in order to harness this great water power now going to waste and make it pull these two plants and produce the nitrates and the fertilizers for which there is a crying need that is nation wide. It is admitted that these things should be done, and that their accomplishment will greatly promote the general welfare. Indeed, such an accomplishment will do more than any other one thing to promote the success of agriculture, contribute to general prosperity, and absolutely provide for the national defense.

I submit that my proposal provides for doing these things in the most efficient manner, at the least possible cost, and also guarantees a most liberal cash return to the Government after the investment.

The testimony of Major J. H. Burns before the committee was taken very much into consideration in our analysis of the project, for the reason that Major Burns is considered throughout the entire country as the foremost expert on nitrate manufacture, and his consideration of the nitrate plant No. 1 was particularly along the lines of our proposal for the conservation of that plant, the remodeling of that plant, and bringing both processes into operation.

In considering our offer along the lines of the advisability of nitrate plant No. 1, if the committee feels that it is important to make any further expert investigation regarding this nitrate plant No. 1 and the practicability and economy which it will serve, we would suggest that further hearing of Major Burns on the subject might be of considerable practical interest.

I do not know of anything more that I have to advance in the way of explanation unless the committee has some questions that they desire to ask me regarding our offer that have not been touched upon.

The CHAIRMAN. As I understand your offer, you propose that the Government shall finance this thing entirely. You will simply act as a sort of agent to carry out the plans that the Government engineers were to put into effect, and will not put up any money in doing it, but will expect pay from the Government for doing your share of the work.

Mr. ENGSTRUM. That is practically correct, Mr. Chairman. The only return that we expect to get whatsoever is what we are able to conserve or to save from the excess power and the practical utilization of that excess power in utilizing the high-peak load, utilizing the secondary power to its utmost advantage, holding all of the power intact and keeping the standby steam plants available to make up the gap where the secondary power falls off, and the practical and economical usage of all of the assets which are there and which will be there upon the completion of the project, not offering to purchase any of the property, but all of the property remaining intact and in the ownership of the Government.

Mr. McKENZIE. I would like to ask you just one question. Mr. Engstrum: Of course, any returns you might get under this proposition, in a sense, are prospective rather than definite, is not that true?

Mr. ENGSTRUM. Yes; absolutely prospective. They depend entirely upon the ability of our company to make a profit out of the excess power. It must necessarily depend upon the successful operation of the whole property, including the nitrate plants.

Mr. McKENZIE. It is speculative in a sense.

Mr. ENGSTRUM. Entirely.

Mr. McKENZIE. I take it, however, that, in submitting the proposal, you have gone into this thing to some extent and have undoubtedly made some estimates. What estimates have you finally concluded would probably be a possible return to your company in case this project was carried out? What would be the annual return?

Mr. ENGSTRUM. As stated before, that is entirely speculative and would be only based upon the power that we would possibly be able to conserve for sale over the 1 mill—the 1 mill all going to the Government. This might be considered as a basis on which we would figure our compensation—a fraction of a mill averaging it throughout, taking the good, bad, and indifferent, and the high-peak load, and the moments when there would be no demand for the power, and the fraction would be a very small fraction of 1 mill which would come to the operating company.

Mr. McKENZIE. However, in a sense, you would be in this sure position that, not having invested any money, if you did not receive any returns, you would not be out anything except, perhaps, some of your time?

Mr. ENGSTRUM. We would be out considerable expense of organization and expert service, which we engage and pay for. We would be out our engineering compensations.

Mr. McKENZIE. Viewing it from your standpoint, is it not what we might term a rather "safe bet"?

Mr. ENGSTRUM. Yes; we tried to make it safe.

Mr. McKENZIE. Yes.

Mr. ENGSTRUM. We did not want to take any element of chance——

Mr. McKENZIE (interposing). I do not ask that question in a spirit of criticism.

Mr. ENGSTRUM. No; we tried to make it safe.

Mr. HULL. Mr. Engstrum, this may be a little outside, but you said you were building ships for the Government now.

Mr. ENGSTRUM. We are just completing the last contract. We had two contracts with the department.

Mr. HULL. Whom were they with?

Mr. ENGSTRUM. With the War Department.

Mr. HULL. With the War Department or the Shipping Board?

Mr. ENGSTRUM. With the Quartermaster's Department.

Mr. HULL. For what kind of ships?

Mr. ENGSTRUM. They were harbor-and-river-service vessels for serving the posts; a special type of small vessel—150-foot concrete vessels—with two Diesel engines. There is one of them here on the Potomac River, serving between here and Fort Washington. There is one in service on the Cape Fear River, between Wilmington and Fort Caswell. They are the most economical type of Diesel-engine vessels that is operating in this country to-day. They operate a 600-ton vessel, carrying 500 men, at a cost of about 1½ gallons of crude oil per mile. That is almost as cheap as running an automobile.

Mr. HULL. How fast do they go?

Mr. ENGSTRUM. They run this trip from here to Fort Washington, which is a little over 12 miles, in about 50 minutes.

Mr. HULL. How many of those vessels did you build?

Mr. ENGSTRUM. We built seven of that type and three tankers to serve the various harbor vessels.

Mr. HULL. You are not building any seagoing vessels.

Mr. ENGSTRUM. No, sir.

Mr. HULL. And you did not build any?

Mr. ENGSTRUM. No; we did not build any seagoing vessels.

Mr. MILLER. Just one question, Mr. Engstrum. As Senator Butler said on Friday, your company is merely an operating company or exclusively an operating company?

Mr. ENGSTRUM. Yes.

Mr. MILLER. Now, what argument can we put forward from your point of view to our colleagues on the floor of the House on the principle of paying your company a 5 per cent cost-plus on the completion of that dam when we have our own organization composed of Army engineers ready to take hold of that dam and complete it without paying this cost-plus percentage to your company. What argument would you suggest to this committee to make to our colleagues on the floor of the House to overcome that suggestion.

Mr. ENGSTRUM. It is a well established principle, I think, that private contractors or private operators are able to do work cheaper than the Government. That has been my experience in contracting for 25 years and in handling it under private engineering we divide it up into what we consider the most practical divisions for the letting of the contracts. We prepare all the additional data necessary other than that which is already provided by the Engineers. The Engineers of the Government have very complete plans for the construction of the dams, but the plans which we will have to provide and submit to the War Department, with our engineers and experts, are regarding the revisions of the two plants. They have not yet been provided.

Mr. MILLER. I was limiting my question to the completion of the dam.

Mr. ENGSTRUM. Yes.

Mr. MILLER. Now, you maintain, do you, that the Government can complete that dam at less expense by the cost-plus method with your company than they could complete it themselves through the Army engineers.

Mr. ENGSTRUM. We would not call this a cost-plus method, Mr. Congressman. This method is not what is known as a cost-plus method, because in this 5 per cent, the overhead which always goes into the cost of a project, is under the plus, in this condition.

Mr. MILLER. The cost-plus was a misuse of the word on my part.

Mr. ENGSTRUM. It does not fit this occasion exactly.

Mr. MILLER. But what I am getting at is that you maintain you can take hold of that dam and by the Government paying you 5 per cent you can complete it under what the Army Engineers could complete it without the 5 per cent.

Mr. ENGSTRUM. I thoroughly believe that I can, in the light of my experience.

Mr. WRIGHT. Mr. Engstrum, you did some shipbuilding during the war for the Government?

Mr. ENGSTRUM. The harbor and river type vessels I mentioned.

Mr. WRIGHT. How many did you say you built?

Mr. ENGSTRUM. We built nine of the early type during 1919 and we finished seven of the Diesel engine type during the year 1921, and we are just finishing the tankers which supply these vessels with their fuel, burning heavy oil.

Mr. WRIGHT. Under what character of contract was that work done?

Mr. ENGSTRUM. That was open bidding, awarded to the lowest bidder—a lump-sum contract.

Mr. WRIGHT. And you are now just completing that work?

Mr. ENGSTRUM. Just completing the service vessels, the tankers for carrying the oil.

Mr. WRIGHT. Did the contract turn out agreeable to you and to the Government? Was there any friction about it?

Mr. ENGSTRUM. There was not a particle of friction. The vessels were all tested and are performing more than was expected in the way of economy of operation and speed.

Mr. STOLL. Mr. Engstrum, you spoke of the overhead in your construction of this dam under the 5-per-cent clause; what is the overhead you refer to?

Mr. ENGSTRUM. The overhead is the accounting system necessary to carry on the business and the engineering companies which operate together with our company and all the expenses entirely outside of the lump-sum contracts which are let. All contracts will be let as lump-sum contracts. Now, to carry on those lump-sum contracts, all the other expense falls on the operating company.

Mr. STOLL. Your work will be solely seeing that the contractors do the work according to the specifications, will it not?

Mr. ENGSTRUM. Not entirely. We prepare in conjunction, certain specifications that are not yet completed, and submit and divide the contract into its various and most economical parts from excavation to the cribbing or the water work, and then into the concrete and machinery and the installation machinery, and all the various subdivisions which run into quite a large number.

Mr. STOLL. It would not run to anything like \$1,250,000, would it?

Mr. ENGSTRUM. In the expense?

Mr. STOLL. Yes.

Mr. ENGSTRUM. The usual expense of the engineering fee alone, which does not cover all the operating expense of the company, is customarily 5 per cent on any engineering project, and you will see estimates all the way through providing in the cost of construction of these various projects the engineering fee, and you will notice that they are very large fees.

Mr. STOLL. But this is to be done under the plans of the Engineers of the War Department?

Mr. ENGSTRUM. The plans that are now completed, not the specifications which are yet to be completed, and the divisions of those specifications. It requires our engineers to take it up where the War Department has brought it up to this time, and in conjunction with the engineers of the War Department to complete the contract. Taking the expense over three years, I do not figure there is any profit to speak of. It is barely an equal proposition. If the Government desires to segregate that part from our contract, it would be agreeable to us, providing we see that the maximum amount of machinery installation is provided, because there is so much discussion regarding whether 200,000 kilowatts shall be installed or 416,000. In a 200,000 kilowatt installation, it would not make the operation of the plant profitable or possible or economical.

Mr. MCKENZIE. That is all, Mr. Engstrum, and we are much obliged to you.

Mr. MCKENZIE. Is Mr. Levering present?

Mr. LEVERING. Yes, sir.

Mr. MCKENZIE. You may make such statement as you desire.

STATEMENT OF MR. J. H. LEVERING, WASHINGTON, D. C.

Mr. MCKENZIE. Mr. Levering, before making your statement, will you state for the record your business?

Mr. LEVERING. I am a civil engineer. I have been in the practice of the profession for over 30 years. My residence is in Los Angeles, Calif. I came here in connection with the power bill; that is, the Federal power act, and I got interested for some other parties in the Muscle Shoals project. I have been there twice as an engineer and have examined it very carefully and helped to draw up the present contract or tender that is made by Mr. Engstrum. However, the tender was changed, contrary to my judgment, and I feel that I ought to show this committee the effect of those changes. I could not conscientiously stand by the project now, and I do not believe the committee has yet seen the contract as I look at it.

Mr. Engstrum, first, wants a cost-plus contract. He lets the contract to a contractor whom he states will have to have 10 per cent; then he gets his 5 per cent on top of that, which makes it a 15 per cent contract, and that in itself is 15 per cent more than there is any reason to pay.

I was at Muscle Shoals when the Army engineers were placing 4,000 cubic yards of concrete per day in that dam, at a cost of less than \$25,000; that is to say, less than \$7 per cubic yard; and I do not believe that all the engineers in the world could do that work any cheaper or better than the Army engineers are now doing it.

Now, I want to say that 15 per cent would only be a starter for his profits. The chairman seemed to be a little bit uneasy about whether Mr. Engstrum was going to make any money or not, and I want to show where the money would come in.

"SEC. 21. STORES, STOCKS, AND EQUIPMENT.—All stores, supplies, equipment, including engineers' supplies, files, and instruments, and other loose personal property now on or about the premises, whether or not required for construction purposes, but not including subsistence stores, shall become the property of the lessee upon the execution of this contract."

He would then acquire \$3,500,000 of property immediately upon signing this contract. That \$3,500,000 would include the derricks, the engines, the motive power of that work, and if you let it to a contractor, he could sell it back to him at a cost of at least \$5,000,000, or rent it to him. So that Mr. Engstrum would not be short of money anywhere during the construction.

I want to call attention to another statement. The alterations of the plant are estimated at about \$7,000,000. Such alterations are to be made at the expense of the contract. There is a trust fund created of one mill for each kilowatt hour of current sold; the mill and the cost of the nitrates becomes a trust fund in the hands of the lessee to make up the deficit in the manufacturing of nitrates and also for the purpose of making the alterations from time to time in the plant.

Mr. MCKENZIE. Did you write that provision—did I understand you to say? Is that one of the provisions you prepared?

Mr. LEVERING. No. These are the ones they changed on me, and I came here to explain that to this committee, that I was not guilty of it. I knew it was known by the committee I had prepared the plan and I wanted to make an explanation.

When business gets dull with them all they have to do is to tinker with the plant and use up all the money in the hands of the trust fund. They do not have to do a thing about making nitrates.

I do not make any reflections upon these gentlemen; that is their idea of business, but not mine.

When the war was declared on the morning of the 6th of April, our family was my wife, my son, and myself, and between breakfast time and noon the boy enlisted in the Navy and I went out to help the Government for a dollar a year. I got the promise of a dollar a year but I have not got the dollar yet; I was to sell bonds. They made me vice chairman of the committee in Los Angeles, to sell bonds, and when I went around to the people that made a

sacrifice to get the money to keep the men in the field and keep them supplied with ammunition, I just felt it was wrong that this plant should be made the football for a lot of speculators, and I come here as an American citizen to protest against it.

Now, the construction plant would be owned, as I say, by the lessee, and he could let it out to his contractors; he might get 25 per cent more; you will have 25 per cent going to the contractor and engineer, and 25 per cent to the lessee for his equipment, which would make it break about 50-50; that is to say, if you give Mr. Engstrum \$3, all his bond does is to guarantee that he will spend \$2 and keep the other dollar, and you can look it over until your eyes are sore and you can not find any other responsibility under that bond. If he fails to keep that dollar the bonding company would be liable.
